For the American Bee Journal

# The Real Cause of Dysentery.

JAMES HEDDON.

Mr. Doolittle says: "I believe confinement does cause the so-called dysentery. In this we differ. I claim that cold and confinement do not "cause"

cold and continement do not "cause" dysentery, but act as an aggravation to the cause. I claim that the only theory or hypothesis which has ever been advanced that will cover all the ground of facts regarding this disease, is the one of over-vegetable matter, or "Bacteria in the food"—one or the other.

While the statements of men we have never seen are not as convincing as logic, with which to prove their theories, these assertions are unexcelled material to disprove them. Now, I will prove by Mr. Doolittle's own statement in the article I am now answering (see first page of Bee Journal for April 6, 1881) that he has formed wrong conclusions, from his own personal experience: from his own personal experience:

"Again, in the fall of 1878 our bees were prepared for winter in the best possible shape, and had nothing but white honey in their hives, said honey being collected the early part of July, for we had no fall honey. Sixty colonies were put in the cellar, and 90 left on the summer stands, two-thirds of which were packed with chaff and straw. Winter set in early and the weather was so cold that no bees could fly with safety for nearly 4½ months. At the end of 4 months some of our best colonies were dead, with the combs and hives soiled badly, while others sitting right alongside of them were in as fine condition as could be, and remained "Again, in the fall of 1878 our bees condition as could be, and remained thus, coming out strong in the spring. If it was 'bacteria' in the honey, why did not all die, as all had the same stores?"

contradicting his statement, and say that bees do not all have the same honey, neither in taste, color nor consistency, and that, too, when the honey was gathered in the same apiary and at the same time. If "bacteria" was the cause, it would be only reasonable to suppose that some trees or nectaries would be infested with them, while others would not; that colonies gathering from that linden tree over east would get infected honey, while those gathering west, or perhaps a little further on, would get that free from infection.

Now, I do not say I ever saw this supposed parasite, or that I have searched the honey for an over-amount of vegetable matter, but I do say that these hypotheses are the only ones yet put forth that cover the whole ground of our experience. Again I quote:

"We also placed 60 colonies from the "We also placed 60 colonies from the same yard in the cellar on the 1st of November, and did not set them out till May 1st, and 55 of the 60 came out in good condition, while we only saved 15 out of the 90 out-doors—75 dying with the dysentery, so-called. If it was infection of the honey, why did not those in the cellar die also, and especially as they steed six month's continement? they stood six month's continement? The past winter has shown the same results, only our loss is but about 10 per cent. so far."

Allow me to ask Mr. Doolittle, if it as "confinement" (now remember, was "confinement" (now remember, that is the cause he assigned, and which he hoped to clearly show), how did the bees in the cellar so ably bear 6 months of it? Was not the trouble in the food, of it? Was not the trouble in the food, and the cellar being a good one, the bees ate so much less of it that the "aggravation" of cold (which causes excessive feeding) was thus removed from their conditions. He is right about the large consumption of honey causing the disease; but I imagine the worse the honey is infected the more the bees will eat

In the literal sense of the term, nature In the literal sense of the ferm, nature instinctively knows but one want—hunger, and bees, like the colicky babe, try to appease the unnatural distress by feeding upon that which caused it. Thus we see that this, like other ills, whether most all or physical processes. whether mental or physical, possesses the calamitous capability of perpetuating itself.

I know that dysentery can be produced at will in a very short time (especially with young bees) by combined gorging and frightening, for, with all animated nature, fright has a sudden and powerful effect upon the intestines. Perhaps the nuclei contained not the clearest of leaves wearhous they add not here the lioney; perhaps they did not have the dysentery unto death.

I found some years ago that agitation r tound some years ago that agreation was a great aggravation, but not entirely productive of dysentery. See Gleanings for January, 1875, page 17, wherein I said, "Place your colonies in wherein I said, "Place your colonies in their special repositories so quietly they will not know it." Soon after II. E. Bidwell said, "Bees moved into winter quarters seem to sleep with one eye open all winter, always on the watch for that disturbance again." Mr. Milliner, of Big Rapids, Mich., refuted this idea, because he stopped up his hives and wheeled them over plants some 20 reds. wheeled them over planks some 20 rods, and then slid them down another plank If it was confinement, "why did not all die," I ask?

I will answer Mr. Doolittle further by colonies) wintered well.

Thus we see that fright is not the cause, but another aggravation, probacause, but another aggravation, probably in a double manner, both from gorging and the mental effect, as above referred to. If cold and confinement were the causes, then honey-producing would naturally move southward this spring. Northern Michigan bee-keepers would be buying and moving bees from Southern Indiana; but the reverse is more probable, as while Northern Michigan, with its purer air and less tendency to the production of low forms of animal and vegetable life, has wintered its bees to a considerable extent. tered its bees to a considerable extent, Southern Indiana is the worst cleaned

out community on record.

But Mr. Doolittle is a great matter-offact man. Maybe he would be pleased
to have some facts from Michigan, and not all confined to one man's experience (my own), but that of many real, reliable persons (who do not sell supplies), and any of whom could be written to upon the subject: 1I. D. Burrell, Bangor, Mich.—Bees confined 120 days; all packed out-doors; loss 20 to 40 per cent. T. F. Bingham, Abronia, Mich.—All packed out-doors; loss 20 per cent., I believe. F. C. Easton, Hartford, Mich., a farmer.—Had 22 colonies with some straw and dirt poked up against three sides of the hives; all strong to date. Not much confinement in his yard, was there? Mr. D. D. Palmer, of New Bosteries and straw and straw and part of the straw and there? (my own), but that of many real, reliathere? Mr. D. D. Palmer, of New Boston, Ill., I learn has lost every bee of his 240 colonies. His bees must have been "confined" about six years, judging from results.

ing from results.

Eleven years ago, I had colonies die with dysentery in its worst form, in less than three weeks after being put into my cellar, which was a good one. The winter was not longer than others in which I wintered my bees nicely, but in 4 months only 3 colonies out of 48 were left. The past winter there must have been a large amount of "confinement" to the square inch, especially in Southern Indiana. One of the 40 colonies above referred to was brought from a farmer's, some 4 miles away. Notwithstanding they were drawn over a rough read the first of winter and put right. road, the first of winter, and put right into the same cellar, without any flight, that colony, and that one only, came out in splendid condition. They gathered their honey from the same kind of flora (clover, basswood and fall flowers), but in a different learning and their but in a different location, and their honey was pure. Thus the aggravation but in a different location, and their honey was pure. Thus the aggravation of this rough removal had no effect upon a cause that with them did not exist. White honey is no better than dark to winter upon. Such phenomena are of common occurrence, and I ask Mr. Doolittle if any of his theories will account for the result?

The trouble is each bee-keeper, as soon as his bees die looks over his own exist.

as his bees die, looks over his own ex-perience only (being so intensely ab-sorbed in his own losses exclusively), and forms a sudden conclusion as to the and tornis a student concension as to the cause, and a sure preventive next year, while if he would study the causes of the losses of his neighbors and others within his knowledge, he would find out he knew but little about it, and in this way be of some use in the final settlement of the problem.

winter losses, which are as a fire-fly is to the sun, compared with it. It is very easy for the novice telegraph operator to read a message by sound when its contents are previously known; how he can plainly hear each letter! How graphically the weather prophet can describe what he prophesied a few weeks ago about the yesterday's storm. It is to-morrow's weather that baffles him most, and that he predicts so vaguely about for fear of missing it.

We look into a hive silent in death, top-bars covered with black excrement, several inches of dead bees on the botto the sun, compared with it. It is very

several inches of dead bees on the bottom board, and wisely say: "Oh! I see; things were not right here in the first place!"

Now, I am looking for the man who an come into my apiary each fall, not to fix it, but to "spot" the condemned colonies (through my ignorance of nature's laws condemned), so that I may mercifully and profitably chloroform the bees and save my honey, combs and hives clean, and the trouble of further attention and a knowledge of where I attention, and a knowledge of where I will stand the next season. Verily, here will stand the next season. Verily, here knowledge is power to both of us, for I could well afford to pay the witch \$25 or \$50 per day and make a large margin besides. Looking at the subject in this light, through the telescope reversed, does it not look a little different?

As soon as time will permit, I will try to separate Mr. Doolittle's talk about Dowagiae, Mich., April 20, 1881.

For the American Bee Journal.

# More about Alsike Clover.

M. M. BALDRIDGE.

In the spring of 1874, a plat of prairie soil in my garden, about 40 feet square, was seeded to oats and Alsike clover. The crop of Alsike for each of the years 1875-76 was a fine one. This plat was planted with beans in 1877, owing, I think, to the Alsike having run ont, or being a poor stand. The plat was plowed again in the spring of 1878, and left uncultivated. In the fall I found it nicely seeded to Alsike—the plowing having brought to the surface the seed that failed to germinate in 1876. Since the spring of 1878 the plat has not been disturbed by the plow. For the past two years the crop of Alsike has been good, and at this date (April 20) the stand is excellent, and chiefly from last season's self-seeding. The prospect for a large crop this season is as good as any preceding.

Alsike is said by botanists to be a promount but I de yet rely upon that In the spring of 1874, a plat of prairie

Alsike is said by botanists to be a perennial, but I do not rely upon that claim, but upon its re-seeding the land in July and August of each year when mowed for hay or seed. Close pasturing early in the season might, therefore, be an objection. Timothy will run Alsike out; so will timothy run out the common out; so will timothy run out the common red clover in many localities—notably, Western New York, where I formerly lived. Red clover there, when mixed with timothy, will run out in two seasons; but no one ever thought of discarding it on that account. If Alsike will not do well for more than one season, it will then pay to ruise it—as, when mixed with the common red or timothy ment of the problem.

All know that the main cause of our winter losses is one; that the phenomena is alike in the main; that if this disease (by common consent called dysentery or cholera) could be warded off, we would easily get along with all minor

of course, the soil and season be favorathoney is difficult to transport, and to ble for the secretion of honey in any export. Extracted honey is therefore of course, the soil and season be favorable for the secretion of honey in any other kind of clover. It should be borne in mind that white clover, as well as many other plants, tail to secrete honey occasionally. It should, therefore, surprise no one to find Alsike no exception to the rule. But I have yet to see the season in my neighborhood when Alsike fails to produce honey of the finest quality and an abundance of it. St. Charles, Ill.

For the American Bee Journal.

## Extracted Honey.

o. CLUTE.

Those veteran and successful bee-keepers, Charles and C. P. Dadant, of Hamilton, Ill., have done the bee-keep-Hamilton, III., have done the bee-keeping fraternity a good service in publishing their experience with extracted honey. They have put it in a neat, well-printed pamphlet, entitled "Extracted Honey: Harvesting, Handling, Marketing." In the first part they give a brief history of the use and the inferiority of strained honey, then of the invention of the honey extractor, and a statement of the genuine excellencies of extracted honey, and of the advantages to the bee-keeper in producing it.

Under the head of "Harvesting" they give us an inside view of their methods. Anyone intending to extract on a large scale will find much of value in this record of practical experience. Their capping can, so made that the frame of honey to be uncapped rests over the can and the cappings drop on a large sieve which allows the honey to drain into a recentacle below, is a most drain into a receptacle below, is a most convenient aid in saving time. A little device, for freeing the room in which the extracting is done from bees, is very ingenious. Anyone who has been very ingenious. Anyone who has been annoyed in extracting by the bees, or who have been made sad by seeing so many of the little fellows beat themselves to death against the windows or the wire netting, will be glad to read this plan, and to adopt it. Though they prefer not to extract from brood combs they say it can be done without injury to the brood. This coincides with my own experience. By extracting with care the brood is not injured, and the cells being emptied of honey the queen lays in them, and you get solid frames of brood.

They store their extracted honey in

They store their extracted honey in barrels, using oak barrels that have contained alcohol or whisky. A most valuable part of this pamphlet is devoted to marketing. They tell us their experience for several years, which finally led them to adopt tin pails as the best package for retailing extracted honey. They use pails of different sizes, containing 10, 5, 21, 2, and 11,4 lbs. each. The smallest sells the best, which is only a further illustration of the fact that large numbers will buy an article that sells for a small sum, even if the sum thus paid is large in proportion to the quantity of the article obtained. In using tin pails for the extracted honey using tin pails for the extracted honey several advantages are gained. They are easily handled, they do not break, there is no leakage, when nicely la-beled they look well, and they are cheap. Undoubtedly tin pails are the best package for retailing this product, which is destined in the future to oc-cupy an important place in the con-sumation of nearly every family. sumption of nearly every family.

It seems to me that comb honey has intrinsic merits which will always keep it in large demand. The wise and enintrinsic merits which will always keep it in large demand. The wise and enterprising producer of comb honey will always have a fair market. But there is no doubt but extracted honey has great merits—merits which now are unknown or unappreciated by very large numbers. When these merits become

boney is difficult to transport, and to export. Extracted honey is therefore the coming honey. California will soon see before her an inter-oceanic canal which will give her full scope on the European Continent. As for us beekeepers of the Eastern and Middle States, let us improve our home market, and let us learn to produce good, cheaphoney. In the meantime let us hope that Congress will put an end to all food adulterations by enforced legislation. Let us hope, also, that Congress will understand the propriety of placing the public services in the hands of the people, and will organize the railroads with the regularity, the honesty, and the careful, cheap, and prompt management which are so prominent in the Post Oflice Department. Then the honey resources of America will aston. the Post Office Department. Then the honey resources of America will aston-ish the Old Word, and will invade it." lowa City, Iowa.

# For the American Bee Journal,

### Foul Brood.

DR. I. P. WILSON.

The JOURNAL for April 20, page 124, contains an editorial on "Foul Brood," and especial reference is there made to my indorsement of Mr. Jeffrey's views

my indorsement of Mr. Jenrey's views on that subject.
You are right, Mr. Editor, when you say that "facts and experiences are what we want," but it is quite evident that two men may have precisely the same experience, and yet draw very different conclusions. One may be a hand a property an independent thinker. close observer-an independent thinker, and from him we may expect inroads made upon popular theories and beliefs, and although he may be laughed at, at first, in time he will be honored as a progressive man. Another man will "swallow" the opinions of others—follow in their wake, and go through life perfectly satisfied in believing anything that is generally believed by others.

I felt like patting Mr. Jeffrey on the shoulder, because I believed him to be thinking for himself, and thinking, too, in the right direction on this subject of a New Livest. Foul Brood.

I acknowledge, Mr. Editor, that the I acknowledge, Mr. Editor, that the few lines I wrote for the Journal simply agreeing, fully, with Mr. Jeffrey's article, without giving my own experience, was rather an easy way of expressing my views on that subject. In fact, my professional duties require all my time during the day, except an hour or two spent in my apiary in the early morning, and with a considerable amount of work to do with my pen at odd moments. I find it next to impossiodd moments, I find it next to impossible to devote much time in writing for the Journal.

But now for my experience with foul But now for my experience with foul brood. But perhaps what I have hitherto called foul brood is not the devastating disease described by some writers. What I have witnessed has not appeared to me as the result of disease, but as the death of the brood from insufficient animal heat. I have had nothing of the brood is a variety for a proper section. ing of the kind in my apiary for a number of years, but have a very vivid recollection of an experience of 7 or 8 years ago. Several of my colonies left their ago. Several of my colonies left their hives in disgust, and on examination I found the brood dead and putrid, the stench being so great that it was noticeable at some distance from the hive. The comb seemed to be completely infiltrated with the stench, and the hive throughout tainted from the noxious odor. At that time I had read nothing on the subject of foul brood, and in seeking for a cause I became convinced that the brood had perished from becoming chilled, and putrefaction naturally followed. Having satisfied myself of the cause, I have ever since kept a lookout for dead brood, and when I

If one colony in an apiary has foul brood, the cause that produce com orood, the cause that produces it is common to all, but more especially to the weaker colonies, so the disease (?) being general throughout the apiary does not argue in favor of the commonly accepted theory.

accepted theory.

Should there come a cold spell during the next week or two 1 shallexpect foul brood to make its appearance in our apiaries in this section of the country, and for this reason; Warm weather set in quite suddenly here about April 15. My bees have been as busy as they could be the past week carrying in pollen and honey. The honey is stolen from the colonies that died during the winter, and still remain on their summer stands. and still remain on their summer stands. The bees are spread out over the combs and the queens are actively engaged in laying. A cold snap would drive them closer together, and the unduly en-larged brood nest will not be sufficiently dead brood ness will not be sunce any eovered with bees to be kept warm, and dead brood will be the result. But it is to be hoped that this sudden change in the weather will not come. There are bee-keepers that will take a frame partly filled with dead brood, and put it is the sustance of change along the them. to "clean up." which is an unreasonable task to impose upon your little pets. To do this is simply creating a nuisance in the hive, and spreading foul brood more extensively through your apiary. Better spend a little time in picking out the dead brood, and if the comb has not been vitrated, it may be utilized to advantage.

Foul brood may be produced in another way. Separate the brood nest, when it is already as large as the bees can cover, by carrying the outside frames to the centre of the hive, thereby inviting the queen to enlarge her brood beyond the capacity of the bees to keep

After writing the above it is not necessary for me to say that I do not believe it to be a disease any more than freezing or drowning is a disease.

There are other phases of this subject that I should like to refer to but my time nor your space will admit of my

Burlington, Iowa, April 27, 1881

For the American Bee Journal.

# The Cause of Dysentery, Etc.

WM. R. HOWARD.

I have just visited some of the principal bee-keepers in this vicinity; their osses have not been heavy compared with our northern friends. Though we with our northern friends. Though we had a rough winter our bees were not eonfined long enough to cause dysentery. Bees are wintered on the summer tery, bees are wintered on the summer stands without packing; some had a few boards leaned against the north side of the hive as wind-breaks. At one time my bees showed signs of dysentery, but a cleansing flight

them. I cannot agree with Dr. E. B. Southwick regarding the cause of dysentery, viz: starvation. In the Doctor's first cases the confinement was the cause, as cases the confinement was the cause, as you suggest. I have moved bees a few miles 2 or 3 times within 2 or 3 years, during ramy weather, and if they could have a good eleansing flight they suffered no inconvenience, but if not, they suffer more or less from dysentery. In one case, 2 years ago, 1 moved 2 colonies; a rain came on before I got home with them, a "norther" came up, and it was 3 days before they were able to get out, and when they came out they were diseased and 1 lost them; they had plenty of honey and brood. I bought a colony from a neighbor and moved it home; the weather was fine but there was not much honey to gather. is no doubt but extracted honey has great merits—merits which now are unknown or unappreciated by very large numbers. When these merits become widely known the sale of extracted honey will be very large.

The Dadants have faith in extracted honey. They show their faith by producing it in large quantities, and selling it to advantage. They close their valuable paniphlet with some remarks which I will quote: "To sum up: Comb honey is a fancy article, for which only fancy prices can be obtained, and these prices will always be changeable, whilst extracted honey must become a staple article sooner or later. Comb

must be killed or the whole apiary will the most signs of dysentery this past winter were the strongest colonies I had. The reason assigned was, that behad. The reason assigned was, that being strong, they kept up a sufficient heat to make them lively, and they stood by the walk where they were frequently disturbed by the constant passing. There are certain conditions in which bees will become diseased in a very short time if confined to the hive. very short time if confined to the hive

As will be seen from the above, when confined by wet weather, during the height of brood rearing in the spring, bees are apt to become diseased. Those "stupid bees," are neverable to crawl much, to discharge their feces over the frames. Bees that die of starvation, from being away from the stores are generally found full length in the cells; if they were able to count if they were able to crawl much they would certainly be able to reach the cluster and stores. I have not noticed that all bees that die of starvation have the "abdomen always full of dysentery

feces."

Bees that die of dysentery have their Bees that die of dysentery have their abdomen distended with a watery fecal matter, while, on the other hand, bees that die of starvation, the abdomen seems to be about the normal size. Again, bees that die of dysentery are not usually found in the cluster, and stuck fast in the cells, a condition which is nearly always noticed when they have died of cturvation.

died of starvation.

Mr. L. W. Wren, on page 117 of the American Bee Journal, asks if his bees will go 14 miles to a grove of linden, and as that question was not answered. I would say that grove is within surey range of his hope.

swered. I would say, that grove is within easy range of his bees.

Our bees have been set back by the late freezes we have had—3 killing freezes in this month. Our fruit is nearly all killed; in some localities the trees will die Our forest trees had haves marker grown who the less had leaves nearly grown when the last and coldest snap came; the oaks, hickorys and pecans look like the fall of the year. The timber looks dark inside. Corn The timber looks dark inside. Corn was, in many places, frozen root and branch, and has been planted over. Gardens suffered severely, graperies will not blossom much this season, and our ratan vine is dead; it was nearly ready to bloom, and is one of our best honey plants. Haw and honey locust are in bloom now and bees are commencing to work again. commencing to work again. Kingston, Tex., April 25, 1881.

For the American Bee Journal,

# Double-Boarded Hives.

HENRY ALLEY.

I have used double-walled hives more or less since I began bee-keeping, and know from experience that bees will know from experience that bees will winter better in them than they will in single-boarded ones. As I formerly made these hives, I found them expensive, heavy, and requiring too much work to build. During the past winter I made considerable improvement in their generativities, reducing the own. I made considerable improvement in their construction, reducing the quan-tity of lumber and labor. As now made they are a very plain and simple Lang-stroth hive. They require the least work to put them up, and are the most convenient hive in use. There is no useless clap-trap work about them. All the lumber is  $\frac{7}{8}$  thick but 4 pieces. The brood chamber, bottom board and outer brood chamber, bottom board and outer cases are all independent of each other. They will be found a cool hive in summer, as there is an air-space of nearly an inch between the brood-box and outer case. In winter this can be filled with chaff, or left vacant, just as one desires. The bottom section of the outer case is 1½ inches above the top of the brood-box. This is left so that the chaff cushion will tuck down in the air space and out of the way of the cap.

so near the ground. Clamps for the so near the ground. Champs for the bottom board  ${}^7_8$  of an inch square, by  $22^9_8$  long. These are nailed on from the edge 15-t6 of an inch. The broodbox sits inside the clamps, and the outer

box sits inside the clamps, and the outer case outside of them.

Brood-box: Sides 10 inches wide, 1978 in. long, 3g in. thick; front end 9 in. wide, 141g long; back end 9½ in. wide by 144g long, both pieces 7g thick. Nail the sides to the ends at the top ½ inch. This makes the rabbet for the frames to rest on. Cover the rabbet with a piece 3g thick, 2 in. wide, and 15½ in. long. Outer case; 9 pieces in all. Sides; bottom section 11½224 in.; ends 11½ and 167g in. Cut entrance in one end 14x½ in; with a circular saw take out of top edge a strip 7-16 on and ½ in. down, and edge a strip 7-16 on and <sup>1</sup>4 in. down, and the same on the bottom edge of the cap, on the inside edge. This is so the two sections will match together, and keep out the water and cold winds. Top section: sides 7x24 in., ends 7x16<sup>7</sup><sub>8</sub>. If pitched roof is wanted, saw ends 2 in. wider, and taper from the center to the ends to the same width of the sides of the cover. Top boards 10<sup>1</sup>/<sub>2</sub>x26 in. Strip to cover joint 2x26 in. Those who have never made a Langstroth hive may have

never made a Langstroth five may have to puzzle over this some, while an old hand will readily understand it. This hive is so plain and simple in construction, as well as very handy and convenient in every way, that it will commend itself to all. It embodies all the main features of the standard Lang-stroth hive. As double-walled hives are coming into general use, this description may be of some benefit to many of the readers of the BEE JOURNAL.
Wenham, Mass.

For the American Bee Journal.

## Purely-Mated Queens this Year.

J. BOLES.

Inside of a radius of 8 miles I know of several who went into winter quarters with from 50 to 70 colonies, and all are now dead. I do not know of a bee left alive inside of the above distance except my own, and they have suffered except my own, and they have suffered badly. I put into winter quarters 9 colonies, in good order, in double-wall bives, with a space of 3 inches all around, the bottom filled with dry pine sawdust, and sawdust cushions on top, and even I have only 2 left. I examined them today and found them in good order with day, and found them in good order, with brood in all stages. The bees were carrying in pollen very fast; where they get it I cannot make out. Can you tell get it I cannot make out. Can you tell me? In fact they appear as busy to-day almost as at any time last summer. Among the lamented dead are colonies having 3 choice Italian queens and I Cyprian queen. all from the apiary of D. A. Jones. The only ones left alive D. A. Jones. The only ones left alive are some of my own rearing. Nearly all bee-keepers in this part have been an pee-keepers in this part have been using the old box hive and black bees—but these are things of the past. No trouble to have purely-mated queens this year; this is one consolation at least. I cannot afford to have my beethis year; this is one consolation at least. I cannot afford to have my bee-fixtures lying around and having only 2 colonies of bees to attend to. I must look around me and try and buy 5 or 6 good colonies, so that when I get the blues in my office, I can have something to take up my beginner time. I have a to take up my leisure time. I have a few questions to ask, which you will few questions to ask, which you will kindly answer, if not imposing too much on your space. I. Have you any knowledge of any hives baving been made round, in the shape of a barrel, and so arranged as to lie on their side? 2. If so, please give dimensions of hive, and how made? 3. Had it movable frames; if so, were they made circular like a barrel, head, and of what, material, made. arrel hoop, and of what material made, and how arranged in the hive? 4. Was entrance in the side or end? Allow me to thank you for the picture of yourself which you gave us some time ago. 1 must say you are rather a handsometo congratulate you on the success of the Weekly Bee Journal. Of all the papers coming into my office, none are as welcome as the Weekly Bee Journal.

Ridgeway, Ont., April 20, 1881.

[It requires more knowledge of your surroundings than we possess, to inform you where your bees are getting pollen.

In Syria and other countries in the East, bees are kept in clay cylinders, one end of which is entirely closed, and the other partially. No frames are used in these.

I never had better success than the past long, cold winter, that has been reported so universally disastrons to bees. I cannot see what the long cold winter has to do with success as long as winter has to do with success as long as the bees are in proper condition and kept so inside a warm house. On April 15 I put out 140 colonies that had not seen the sunlight since Nov. 15. They seemed quite astonished by the warm sunshine of an April day. Their Rip VanWinkle sleep had carried them over a long experience of 5 months of cold and storm in the outside world. Four rather weak colonies only had pushed by, getting away from their stores and rather weak colonies only had pushed by, getting away from their stores and starving. I am satisfied that I could have kept them in a month longer in good condition, but did not deem it wisdom to do so as brood rearing had nearly ceased for lack of pollen and water. I fed thour liberally for a few days, when natural pollen appeared. They are doing nicely, filling up with brood and young bees. I wintered 70 colonies at another place in another bee house, but could not obtain the condition I considered necessary for certain success. could not obtain the condition I considered necessary for certain success. These did not winter quite so well, the loss being 6 light colonies mostly, although from the same cause before mentioned. The bees, too, were not all in that fine bright condition of the others. These were set out at 4½ months. They are also doing well now. No cushions, no chaff packing, no feeding—housed in a bee-house constructed for the purpose in view of success: temperthe purpose in view of success; temperature average about 40°; artificial heat at times; the bees gorged themselves all the fall on apples, peaches and grapes; about ½ of the colonies were light in stores when put up; I wintered in the same place during the warm winter of one year ago with equal success. I am entirely unshaken by the cess. I am entirely unshaken by the numerous reports of the fearful disaster in wintering. I am quite certain that with proper management bees may be wintered with as much certainty as any stock, at all times.

East Townsend, O., April 29, 1881.

[ We take pleasure in congratulating Mr. Boardman on his success. We have heard of several who had good success in house-wintering.—ED.]

For the American Bee Journal.

# Packing Bees for Winter.

B. M. LINGLE.

Quite late last fall I put 31 colonies into winter quarters—10 being weak nuclei. I fed 125 lbs. coffee A sugar. Just before cold weather sets in is the time to do the packing. I use dry goods boxes about 6 inches larger than the bires take the tenend last of feathers. boxes about 6 inches larger than the boxes about 6 inches larger than the lives; take the top and bottom off and set the box over the hive; cut a notch in the box to correspond with the entrance of the hive; place three blocks from front of hive to box, and pack all around with chaff; after this is done, take the top off the hive and replace it with a blanket, then fill with chaff. This will leave the chaff 6 inches deep over and around the hive. After this is all done, put the top on the box to keep all dry. I have been packing in this way for several years, and have wintered successfully. After unpacking. I find my bees in fair condition; 2 nuclei, covering but 3 combs, froze; 2 starved, and 1 was queenless. I united this one with a weak colony, which leaves me 26 colonies in fair condition. I think the chaff packing is the successful way to winter bees in this latitude. Success to the AMERICAN BEE JOURNAL.

## Using Combs in which Brood has Died.

Please tell us whether decaying brood found in the combs of those colonies that recently perished, has any tendency create foul brood or anything similar in treate tout brood or anything similar in its nature, if left to take its own course until used next summer? A few days ago we were cleaning hives and combs from colonies that had lately died, and among the general contents of such hives we found more or less dead brood in different stages of putrefaction. On examination, we noticed in some of examination, we noticed in some of these cells a brownish substance, in ap-pearance some like that found in foul brood (we imagined), but without scent. It seemed like a waste to cut out of the center of almost perfect combs pieces as large as one's hand, or larger, for the sake of disposing of a few such scat-tered cells as mentioned, providing there is no danger or risk in leaving them in. GREINER BROS.

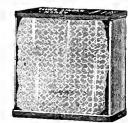

Naples, N. Y., April 18, 1881.

It is not foul brood. The brood was deserted by the bees for some cause, and died; perhaps had been spread, or were not bees enough to properly care for and keep it warm-or for some other cause. We would not, however, leave it in the hive, nor cut or mutilate it; but uncap those cells in which brood has died, then put them away in some dry place till the dead brood has dried and shrunken. When wanted for use, put them one or two at a time in the stronger colonies, where they will be speedily and thoroughly prepared for use. In order to make them desirable for brood combs, it is necessary that the cells be ready for the queen's occupancy as soon as she reaches the comb, or she will either pass over the comb entirely or deposit her eggs here and there wherever she finds unobjectionable spots. Every close observer has noticed that the queen invariably makes a close inspection of the cell she proposes using, and unless perfeetly clean she will not deposit an egg in it. With a cell here and there occupied with dead-larva, it is easy to imagine how the living larva adjoining may be more or less liable to become chilled, as inanimate bodies are not possessed of the natural heat which pertains to those living. It is undoubtedly this natural law which instinctively impels late Catalogues of apiarian supplies: a "good" queen to deposit her eggs compactly in an oval space in the comb, thus economizing to the greatest extent the heat of each individual larva to help keep its neighbor warm. To what extent the presence of dead brood in the combs (which has died from natural causes) may have caused the death of contiguous brood we cannot say, but certainly it has contributed largely to many of the theories regarding "foulbrood" and its tendencies, and perhaps | made: in rare instances has had a tendency to enfeeble many of those bees which survived to maturity.

It may not be out of place, in this connection, to advise that the stronger colonies be selected to do all the drudge work of the apiary, such as cleansing befouled combs, removing mold from combs, and pulling out such dead bees from the cells as will not shake out when dried and shrunken. If your strong credit.

colonies have their hives already filled with frames of brood, then remove sufficient to accomplish the purpose: but where a colony is already feeble, and it is desirable to build it up rapidly, no disagreeable work should be imposed upon the bees to perform, for it will tax their energies sufficiently to provide pollen, water, and do the feeding and nursing necessary for successful broodrearing. A strong colony will accomplish in a few hours that which would embarrass a weak colony for nearly a find the following item: whole season.

Perfection Honey Box.—Mr. J. E. Moore, of Byron, N. Y., sent us a nice box of honey enclosed in his Perfection Caps, of which the following is a correct representation :

All will see that it makes a neat package, very attractive and enticing, and free from leakage, when glass is used. These caps are a rapid and beautiful method of glassing.

This issue of the BEE JOURNAL, the first in the month, goes to all the subscribers of the Weekly, Monthly and Semi-Monthly. Should any of the latter wish to change to the Weekly, they can do so at any time, by paying the difference.

K N. Langers, Belgium, Wis., has wintered without loss 70 colonies, in a bee house, constructed with double walls filled, like ice-houses, having an underground tunnel 50 feet long, for ventilation; it is also provided with up ward ventilation.

@ Dr. N. P. Allen, Smith's Grove, Ky., President of the National Society, desires the Bee Associations and Vice-Presidents for the different States, to send him statistical information concernining bees and honey in time for use at the National Convention at Lexington next fall.

We have received the following

. B. Weed, Detroit, Mich.-4 pages Bees and supplies.

11. 11. Brown, Light Street, Pa.-pages—Bees and apiarian supplies.

1. T. Scott & Bro., Crawfish Springs, Ga.—Italian bees, queens, hives, etc.

😂 Rev. A. Salisbury, Camargo, Ill., desires to have the following correction

I see you have accredited the article I wrote for and which was read at the North Eastern Convention, to L. M. Wainwright, Noblesville, Ind. Of course it was through mistake and not intentional. ntentional. Nevertheless, 1 regret aving been the cause of laying so much intentional. imperfection to the charge of another.

The essay was printed just as it came from the Secretary. The BEE JOUR-NAL is in no way responsible for the

## MISCELLANEOUS.

Bee-Culture in Kansas.—The Quarterly Report of the Kansas State Board of Agriculture, for the quarter ending March 31, 1881, is received, and under the heading, "Condition of Bees," we

Correspondents from only about half the counties in the State report at all on bees, in their quarterly reports. Reports from 15 counties are very favorable, the bees having come out of winter quarters well, and seem to be in a fair quarters well, and seem to be in a fair condition: Chautauqua, Cherokee, Elk, Franklin, Harvey, Jackson, Labette, Lincoln, Montgomery, Nemaha, Raw-lins, Riley, Saline, Sedgwick and Shaw-nee. In the following counties they are reported to have done poorly, in many cases from 25 to 50 per cent, having died from the long cold winter and neglect: Allen, Anderson, Atchison, Bourban Allen, Anderson, Atchison, Bourbon, Brown, Butler, Cloud, Cowley, Craw-ford, Doniphan, Greenwood, Jewell, Brown, Butler, Cloud, Cowley, Crawford, Doniphan, Greenwood, Jewell, Johnson, Leavenworth, Linn, Lyon, Marshall, Miami, Mitchell, Phillips, Pottawatomie, Republic, Wabaunsee, Washington, Wilson, Woodson, and Wyandotte. Those who have made a success in this industry speak encouragingly, and say that it is a want of attention that produced a failure tention that produced a failure.

Bees Without Stings .- The Bienen-Zuechter, the organ of the "Societe D'Apiculteur d'Alsace-Loraine," remarks as follows concerning the stingless bees of South America, and their introduction into the United States:

"The discovery has been made in South America of yellow bees, without stings, and some bee-keepers of the Unistings, and some bee-keepers of the United States have taken the preliminary steps to import this bee into that country. We have informed our readers that Mr. Benton, a bee-keeper of the United Mr. Benton, a bee-keeper of the United States, went to the Island of Cyprus and from there to the Island of Java, to study the *Apis Dorsata*, and would try to import some specimens of these into America. It is said that this bee is much larger than our handsomest queens. Let us hope that Mr. Newman, after what he said in the Convention at Cincinnati along the improvement in Cincinnati about the improvement in the race of bees, will be able to cross this bee with the one without sting, then we will have the bee of the future—a very precious bee, which nobody will fear, and having a longer tongue and larger body, will be able to feed on our immense red clover fields, the nectar of which is not very accessible to the ordinary bees.

Glucose, -In the London Journal of Horticulture, Mr. Frank Cheshire, while eommenting upon the discussions on adulteration in the American Bee JOURNAL, says:

Adulteration with glucose is a base fraud which all good men must repro-bate....Its use as an adulterant is most disgraceful, and all should join hands in fearlessly doing our level best to get in fearlessly doing our level best to get the right ticket put upon any man (and his wares) who descends to a practice which, if it does not lower him, wrongs all those who are striving to do hon-estly. Glucose, although chemically like a portion of honey, is altogether wanting in that which makes honey what it is. Its aroma, the delicate dis-tillment from a thousand lowers inim-itable and incommunicable alike is not thinent from a thousand howers mini-itable and incommunicable alike, is not there, and he who gives the one for the other is as truly criminal as he who tenders knowingly a base com.

The man who will purchase a number of colonies of bees, set them up in some out of the way place, and give the matter no further attention, should keep out of the business altogether.-Grange Bulletin.

Honey Dew. - The Patrons' Guide gives the following on this subject:

"Honey dew" is a name commonly applied to a sticky substance often seen. during hot, dry weather in the summer, on the leaves of hickory and other foron the leaves of hickory and other forest trees. It is not, as many suppose, a natural deposit from the atmosphere, given for the especial benefit of bees, but is exuded from the leaves direct. Hence "honey dew" may be correctly termed a partially dried-up sap. Liebig, in his excellent work, "Agricultural Chemistry," says; "Certain diseases of trees, for example that called 'honey dew,' evidently depend on the want of the due proportion between the quantity of the azotized and that of the unazotized substances which are applied to tized substances which are applied to them as nutriment."

The Manufacture of Glucose, -Mr. Wm. Lynch, Maysville, Ky., has sent us the following from the Cincinnati Star Times:

A recent lawsuit tried before Judge Haight, of the Supreme Court of  ${
m York}$  , has revealed to the public the ex-1 ork, has revealed to the pulme the extent of a new manufacture of general interest. The production of glucose, or "grape sugar," from corn is of very recent date but of great proportions. It is estimated that from 12,000,000 to 16,000 (m) bushels of corn were consumed. 000,000 bushels of corn were consumed the past year in the manufacture of this comparatively new article of commerce; several establishments consuming from 4,000 to 5,000 bushels each per day. The first use this so-called grape sugar was put to was in the adulteration of ale, beer, porter and liquors. The consumption was necessarily limited in this direction, but when it was found that it could be specessfully used. found that it could be successfully used in the adulteration of syrups and sugar the adulteration of syrups and sugar the production has increased with start-ling rapidity. It was proven in the case above referred to—Alberger vs. Hamlin and the Buffalo Grape Sugar Company—that the profits of one firm amounted to one-half a million dollars during the year, and that the profits or amounted to one-half a million dollars during the year, and that the profits on the amount of capital invested were simply fabulous. A glueose factory is better than a field of diamonds or a gold mine. Of course rivers of this fraudulent sweetness will soon flow through the land, and permeate every article of food or drink to which it can be made to assimilate in any form. be made to assimilate in any form.

The means for detecting the adulteration are very easy. Glucose being less soluble than sugar, settles to the bottom of the cup and, when left to dry, forms a hard film, similar to gelatine. On the surface of symp thus adulterated a film or skin forms on exposure to the air, which becomes corrugated as the exposure is prolonged. These tests are capable of detecting a very small percentage of the foreign el-

ement in sugar or syrup.

😂 The Palaski, N. Y., Democrat remarks as follows, concerning Professor Cook's " Manual of the Apiary:

This excellent work has reached its seventh thousand. This shows the appreciation of that book by that portion of the public interested in bee-culture. We advise all to buy the book who are interested in rearing bees; if you are interested in the entomology of the bee; if you want to be posted in bee-botany; if you would learn of bee-enemies; and even if you are only in pursuit of in-structive reading, told in an interesting manner, by one who thoroughly understands his subject.

An exchange gives the following phunny-dote:

"Did any of you ever see a bee's sting?" inquired a teacher of a class.
"I have," exclaimed one.
"Where?" asked the teacher,
"Stock in the nose of a fellow that caught a bee and tried to smell it," said the boy, laughing.

The Wisconsin Farmer fully approves the articles on "Planting for Honey," which have from time to time appeared in the BEE JOURNAL, and copied a portion of one of them, with a a very warm indersement. a very warm indorsement.

Utilizing Old Combs.—I put into winter quarters last fall 14 colonies of bees in chaff hives; only 4 of them came through alive, and they are not very strong. I have 80 frames, containing 125 to 150 lbs. of honey, from the colo-nies that died, and am desirous of building up again—how can I best use these frames of honey and comb? Please inrames of honey and comb? form me through the next Journal.

B. E. Miles.
Glenwood, Pa., April 22, 1881.

[You will find full instructions for utilizing them to the best advantage on pages 86 and 100 of the Weekly BEE JOURNAL.-ED.]

Nine-Tenths of the Bees Dead.—Nearly 9-10 of the bees in this section are dead; a few will purchase sparingly; others a few will purchase sparingly, others will abandon the pursuit. Many feel that a part of the family have died—their pets are missed. All feel that it is as necessary to care for our bees as for chickens, pigs and calves. The roads are impassable in some places, being blocked still with snow. The Rock River is as high as it has been for 30 Byron, Ill., April 21, 1881.

Best llive for Use in Germany .this part of Germany we have two principal crops—hirst, the rape, which blooms in April and May, and second, the linden, which blooms in June and July. The first is the most important. Now. I would submit you these questions: What is the best hive? Is it better to have large populations in large hives, or small ones in small hives?

H. Bursch, Jr. Alsace, Germany, March 26, 1881.

[The standard Langstroth is the best for your latitude. This holds 10 frames, 175% inches long by 91% deep. It is better to have a large population in a medinm-sized hive-that is, a hive which a good queen will always keep well filled with brood. Many of our successful honey producers remove two or three frames from the brood chamber, substituting division boards in their place, at the beginning of the honey flow, thus leaving the lower story entirely to the queen, and forcing the bees above with their surplus. Bear in mind, you never can make your hive too populous for the best results in honey.—ED.]

Upward Ventilation.—I put 9 colonies in the cellar early in the winter; one of them was very weak and of course it died; 2 had chaff boxes. I put on one and when I tried to put on the other, the bees were very cross; I put down the bees were very cross; I put down the cover and thought I would leave them a little while, but being very busy at that time, I neglected to attend to it, and the result was I lost the colony. I have 7 colonies left in good condition. I am convinced that the cellar is the place to winter in and also that upward ventilation is required; mine were all open at the top except the one that died. Most of the bees in this vicinity are dead except those in cellars
State Centre, lowa. T. P.

Bees Wintered Successfully.—I wintered my bees in the bee houses, the loss being so small that I do not miss them in the yard. They are in unusually good condition for the season. I have as yet handled but few and do not gare to disturb them until it becomes have as yet handled but few and do not care to disturb them until it becomes necessary. I will comply with request of Mr. Reynolds in a short time—see page 118, No. 15. I know how it goes to lose my bees in past years, before I had so much experience. Now, when I can look on, it is about as it used to be with us they died through the water. I am of Mr. Reynolds in a short time—see page 118, No. 15. I know how it goes to lose my bees in past years, before I had so much experience. Now, when I can look on, it is about as it used to be with ns, they died through the water. I am more than pleased with the Weekly BEE JOURNAL; could not keep house without it.

J. H. ROBERTSON.

bor lost over 40 out of 41; they were black bees in log gums. My bees brought in the first pollen on the 19th inst. I like the Weekly BEE JOURNAL so well that I should take it if my bees had all died. Accept our thanks for your efforts in giving us such a paper so well suited to our wants.

P. A. RIEGLE. without it. J. H. Robertson. Pewamo, Mich., April 27, 1881.

Robber Bees.-1 have learned a successful remedy for robbing. I find out the hives the robber bees come from, then feed them with syrup made of coffee A sugar, placing it over the broad and letting it run down over the combs, and if they do not stop robbing then. I pour it over the brood until it runs out at the entrance, and that gives them work to keep other bees out of the hive. work to keep other bees out of the hive. It matters not how rich a colony is, feed it as I direct, and you will conquer the robbers every time. I do this feeding early in the morning, and my bees are all living and doing well. Within six miles of my apiary I do not know of but 3 colonies living now. I live in hopes of a good honey harvest.

R. M. OSBORN.

Kane, Ill., April 21, 1881.

Wintered Well.—Spring has come at last. Such a winter man has seldom been called on to endure. My bees wintered well on the summer stands, without any protection, and I lost but one. They died in all parts of the hive—scat-tered in the upper and lower stories but few together. They were strong, with plenty of sealed honey. Why was this? Neither combs nor hive were soiled.

P. P. COLLIER.

Mexico, Mo., April 17, 1881.

[Probably during a milder spell the cluster became divided, when a sudden change occurring in the weather, the bees became chilled, and thus perished before they could again unite.—Ep 1

Bees in Good Condition. - I keep only 20 colonies—have no time to attend to more. I lost one during the past win-ter; all the rest are in fine condition. The one lost would have come through all right had I not unintentionally neglected to give it proper care last fall.

Cincinnati, O., April 27, 1881.

The Loss in Miehigan Two-Thirds.-As hear as I can learn the loss of bees in Michigan has been % up to this time. The season has opened very fine now, and bees are gathering a little honey from soft maples, which seldom yield honey in this latitude. Daffodils are some of the earliest flowers that bees work on here.

J. O. SHEARMAN.

New Richmond, Mich., April 26, 1881.

The Cause of Bee Mortality.—In this vicinity last fall there were 462 colonies, now there are only 100. The few in chaff hives are doing well. The cause chaff hives are doing well. The cause of this mortality began a year ago. Last April was hard on the bees; in June they were starving. For about a week in July bees did well; then it came off so hot that they did not make quite a living from that time out. So they did not have enough food to live on, and some of us resorted to feeding sugar. I tried grape sugar with coffee sugar. tried grape sugar with coffee sugar, equal parts. (No more grape sugar for me to feed bees on in the winter.) Bees in good chaff hives will winter well; if they need food give them candy made of good sugar early in October, and they will winter well even though it be evere as the one just past. artford, Wis. I. S. Crowfoot.

Hartford, Wis.

Rather Discouraging.—My report is rather discouraging; I have but a mere shadow to build upon. I have but 2 colonies left from 22 in the fall; but I expect to fill my yard and get some honey. There has been reported to me within a radius of 10 miles, 838 colonies put into winter quarters, of which only 140 are alive now; I think not more than 100 will live to see the clover bloom. Bees were nearly all wintered on their summer stands, but very few being packed or given any special care. Mr. G. P. Wilcox had 7 colonies packed with chaff enshions on sides and top, all with chaff enshions on sides and top, all came through strong, while his neighbor lost over 40 out of 47; they were black bees in log gums. My bees

Arlington. O., April 28, 1881.

Amber Cane Syrup, etc.—I have built a honey-house and intend ceiling it in-side with matched pine lumber. Would a noney-nouse and intend centing it inside with matched pine lumber. Would you fill the space (4 inches) with sawdust? Would you use green sawdust, if you could not get it dry? Do you think it would do bees any harm to feed them. them amber cane syrup mixed with an equal amount of honey, during the fore part of May? I packed 28 colonies of part of May? I packed 28 colonic bees in wheat chaff on their sum stands last fall, of which I lost 3. their summer good many bee-keepers about here have lost all their bees. G. 11. Denman. Pittsford, Mich., April 20, 1881.

[Have the material dry with which you pack the air-space, whether it be sawdust, chaff, tan-bark, etc., and have a well-regulated ventilator. When bees are flying freely, we think you can feed amber cane syrup and honey with perfect safety.—ED.1

Losses in Central Wisconsin.—Bees hereabouts are somewhat dead. D. H. Wright went into winter quarters with 7 colonies, and came through with all alive, but 1 was queenless. I had 14 in the fall and lost 4; 2 of the 10 left are weak. D. D. Daniher had the same number as myself, and lost all but one. All the above were wintered out-doors in chaff and straw. Cellar-wintering, from what I hear, has been no better. A man by the name of Long lost all but 5 out of some 40 colonies put into the cellar.

John Corscot. Madison, Wis., April 21, 1881.

Had No Winter Flight.—I placed 157 colonies in the cellar Nov. 22; removed colonies in the cellar Nov. 22; removed them to their summer stands April 21; found 9 dead and most all of the maining 148 in good condition. The temperature in our cellar was 45- to 52 Mr. Geo. W. House, of Fayetteville, in his essay read before the North Eastern Bee-Keepers' of New York, says a win-ter flight is necessary for snecessful wintering. I do not agree with him. Our bees have wintered well for the past two seasons without a flight.
C. M. WOOLVER.

Hallsville, N. Y., April 26, 1881.

Wintered in the Cellar Without Loss.-I put 39 colonies in the cellar Nov. 1, and took them out April 20; all had living bees in them, but 3 were queenless, and these I united with 3 weak ones. I and these I united with 3 weak ones. I now have 36 in fine condition. They were confined 170 days. There is a remarkable absence of brood, only 3 have any sealed, but the queens have filled from 2 to 3 frames each with eggs during the past 4 days. The bees are carrying pollen; the weather is delightful but the snow is a foot deep in the woods; as my bees all have a good smuly of as my bees all have a good supply of honey 1 do not anticipate any further losses. My bees are pure blacks and hybrids; the blacks wintered the best. I also put 15 colonies of Italians (a neighbor's) in my cellar, only 8 of which came out alive. Mrs. P., who had 26 colonies on the summer stands, covered with snow, lost all; others have lost heavily.

D. 11. Horkins.

Bear Lake, Mich., April 24, 1881.

Wintered in a Clamp Without Loss.—I commenced the season with 40 colonies, increased to 70, obtained 1,650 lbs. nies, increased to 70, obtained 1,650 lbs. of comb honey. Nearly all were in box hives, but 1 put the swarms in frame hives, one of which gave me 130 lbs. and 2 others about 100 lbs. each. 1 buried 66 colonies Nov. 13-15, and took 34 out of the first trench April 22, and 32 out of the other trench the 24th; all alive, but a few of them are weak in heach but have alouty of honey and to bees but have plenty of honey and to spare. Everybody who left their bees out-of-doors through the winter, in this blocality, have lost nearly all, and some have lost badly when wintering in cellars, so 1 think 1 can cry "Eureka" when 1 lose none out of 66.

D. B. BOOMHOWER.
Rensselaerville, N. Y., April 25, 1881.

[Mr. B's report is refreshing in the midst of disasters. We should like to have him give his manner of preparing the clamp, etc., for a future number of the BEE JOURNAL.-ED.]

Pollen From Sawdust.-In this clie, New York, at an altitude vary from 1,300 to 2,000 feet above tid mate. New mg from 1,300 to 2,000 feet above the waters, no pollen is yet obtainable from any source. Bees work lively to-day on farina of grain. At least 35 per cent, of the stock of bees in this region last fall have gone "where the woodbine twineth." Even in chaff hives bees do not survive long winters without a due allowance of hours even with bether allowance of honey, and with both of those conditions present we have the phenomena of dead colonies in the winter and spring, nor does chaff packing triumph over other modes of salvation. The first time that bees gathered anything to store in their bives, this season, was April 14th, and the first material gathered was sawdust. Green or newly cut white ash trees were sawed into reaper teeth and the dust was taken from under the rows and carried upon land near by. Bees literally swarmed over the heaps of sawdust. The bees loaded their legs with a whitigh substance, somewhat dutings and substance, somewhat glutinous and sweetish. The dust is rich in the material gathered by the bees.

C. J. Robinson.

Richford, N. Y., April 23, 1881.

The Result.—The long winter is over and genial spring is here. What bees I have are now bringing in pollen from soft maples. I wintered 13 colonies on the south side of a tight board fence and lost 3; and I wintered 18 where the wind blew on them and lost 15. I have now 13 colonies; all appear to be doing well. Mrs. C. M. Kingsley. Elvaston, Ill., April 28, 1881.

Melilot (lover as a Fertilizer.—Is melilot clover of much value to plow under to enrich poor or heavy clay soil? If it is a good fertilizer, it will do good to have that fact known in connection with have that fact known in connection and its other qualities. The fertilizing value of white clover, also, may not be fully known.

P. MOYER.

Clark, Pa., April 25, 1881.

[As we have heretofore stated, melilot is an excellent fertilizer; some claim that it is superior to red clover.—Ep.1

Lost 6 out of 22 Colonies?—I had 22 Lost 6 out of 22 colonies;—I had 22 colonies last fall—I1 in Langstroth hives packed with chaff on the sides and top, and 11 in Kidder hives. I lost 3 in each kind of hives. Nine-tenths of the bees in this section are dead. N. wintered 90 on the summer stands and lost 60; W. 21 in her king and lost 10 keep. W., 24 in box hives and lost all; O. had 40, and but 3 weak ones remain; R. 17, and 1 left; A. wintered 22 in the cellar, and has 3 now; G. 14, none left; 50 or 60 more have lost bees in about the same ratio. During swarming time, will it be safe to cut out the queen-cells and turn the queen loose, without caging? I consider the BEE JOURNAL as a weekly very valuable, and much more so than monthly. L. DENSMORE. Livonia Station, N. Y., April 27, 1881.

[It is not always safe to do so, but as a general rule, during the commotion and confusion incident to swarming, the advent of a strange queen passes without notice.-ED.1

Lost 13 out of 42 Colonies. - Bees are Lost 13 out of 42 Colonies.—Bees are picking up nicely during the last week. I lost 13 out of 42 colonies. The cold spell in March was the worst on them. Cause of loss: insufficient ventilation.

C. F. MUTH,
Cincinnati, O., April 25, 4881.

Once 14; Now None. - There you have that I knew something about bees, along came blizzard after blizzard, and snow after snow, till the poor bees had to give up; and I—well, I—shall have to give up; and I—well, I—shall have to get Cyprians, or something else, and begin anew. In this locality all the bees are dead—not one left. Some of my bees were in single and some in double-walled hives—some in old and some in new lives—those that lived the longest were in new double-walled hives. May the frequent visits of the Weekly BEE JOURNAL continue to cheer its readers for years to come.

A. G. BENEDICT.
Millard, Wis., April 11, 1881.

The Cause of Disaster.—My 163 colonies have dwindled to 76. The Italians are carrying in pollen to-day, while the blacks are only eager to pilfer from the remains of their neighbors. My bees were boxed and packed in chaff, after the most approved methods, but exposed to the west and north winds. After reading the reports given in the BEE JOURNAL, with the experience of years and the lessons taught by the beeyears and the jessons raught by the beekeepers in this section, I am satisfied that it is more the place than any one condition. One of our beekeepers reports a loss of 25 out of 30 in box hives unsatisfied on the same section. protected and on the summer stands; another had 70, all boxed in chaff with another had 70, all boxed in chaff with shingled caps, all dead but 20; another had 17, all dead; another 60, a few weak ones left; several had from 3 to 10, all are dead; a Mr. Stinson had 113 placed on the east side of a large building and very much protected on all sides, boxed in coarse straw, and all are strong and healthy; another situated on the east healthy: another, situated on the side of a chestnut grove, with box hives upon benches 3 feet high, no protection, and all are alive and strong, no signs of disease; another put 30 colonies into a cellar, and after this long blizzard win-ter all came out right. I am now com-pelled, after looking over all the testi-mony, to decide that more depends upon mony, to decide that more depends upon the place than any conditions of pack-ing, boxing, etc. Mr. Muth, in a pri-vate letter just received, reports a loss of 25 per cent. Other prominent bee-keepers report even much greater losses. So I am not discouraged, but shall rally to new and untried methods to winter bees successfully. When one feels that the obstacles in profitable bee-keeping are almost surmounted, and that we are just now going to make some money and run the thing after our own notion, to get such a set-back takes the conceit out of us a little. It is really consoling that such veterans as Muth, Doolittle, etc., are fallible with the rest of us.

D. VIDETO.

North East, Pa., April 25, 1881.

Survival of the Fittest. - After a careful examination I find but 15 colonies out of 31 that are certainly all right—a loss of 51 per cent. The hybrids stood loss of 51 per cent. The hybrids stood the winter much better than the natives are winter much better than the natives—at least all the bees alive are well marked. They are now earrying in natural pollen. It is possible that this year may develop a hardier class for the best only survive.

F. A. Grove.

Kirkevilla Mo. April 94 1821 te best only survive. F. A. GRe Kirksville, Mo., April 24, 1881.

Lost 33 out of 85 Colonies. - Last fall I had 85 colonies in good condition. I wintered them in the cellar, ventilation same as on summer stands. I now have 45 good colonies and 7 weak ones, showing a loss of 33, nearly all occasioned by starvation; 3 only had the dysentery. Fully 75 per cent. of the bees in this locality are dead. Success to the Bee Journal. J. H. Davis. Stockbridge, Wis., April 10, 1881.

Loss of Bees in Western Ontario. wing to the increase in other branches of my business I was compelled last fall to sell my bees and supply trade, as I stated in the BEE JOURNAL in January, stated in the Bee Journal in January, keeping only a few bees for some experiments I wished to make. Perhaps I was fortunate, as I find by inquiries and correspondence that 90 per cent of the bees in this section of Ontario have perished during this long cold winter. My bees did not fly from Nov. 5 until My bees did not fly from Nov. 5 until March 4. Those stored in well built houses and those packed in chaff on the summer stands shared alike; about all are dead now. What bees I had any are dead now. What bees I had any personal knowledge of last fall had so much unsealed honey that I was confident, if the winter was a hard one, they could not survive. There are many could not survive. There are many causes for this great loss, but I believe the great cause is the want of proper care and attention in August and September. The only men that make a success of bee-farming are those who study the business, read and experiment, always devoting the necessary time and attention to them. All who have not learned this must do so sooner or later. Why not attend to the bees? If they are worth having they are worth attending to; who ever succeeded in attending to; who ever succeeded in any business that did not look after it

properly? Where the bees are to come from to replenish is something I don't know. But I think any persons not too far away, having bees for sale, who may advertise them in the BEE JOUR-(AL, will get hundreds of orders from his section. W. G. WALTON. this section.

Hamilton, Canada, April 20, 1881.

It Pays to Take the Weekly.—Every apparist should take the Weekly BEE JOURNAL. Last year 1 lost money simply because the Monthly did not reach me in time to tell me that the crop was short. I sold my honey a few days too soon. We are finally favored with some warm weather. On Saturday, April 23, the mercury reached 66 Fahr., and lots of bees swarmed out; I hope to have some left.

11. B. ROLFE. Westfield, N. Y., April 24, 1881.

Bec-Keeping in Kansas.—The losses of bees in this vicinity have not been accurately ascertained but will probably rate about 50 per cent. Bees are mostly wintered here on summer stands out protection, and losses are usually for want of stores. Such was the case here generally the past winter, with few exceptions. There was only one month during winter in which bees did not fly. I successfully wintered a light nucleus on 4 Langstroth frames, on the summer stand, by covering the hive with straw and closing the entrance entirely during the coldest weather. Bees are now gathering honey from wild raspberry and plum, which are 2 or 3 weeks later than usual. The Western National Fair Association, at their fair at Lawrence, Kan., in 1880, gave first and second premiums of \$25.00 and \$12.50 for best and second best 25 lbs. of honey in combs shown in glass boxes. As the tendency seems to be to planting especfor bees, what more inviting field for the apiarist than Kansas, with her cheap lands and mild climate?
D. P. NORTON.

Council Grove, Kan., April 25, 1881.

[Such liberal premiums ought to induce the Kansas bee-keepers to give their best attention to production and marketing, and thus elevate the profession by the adoption of the most scientific and progressive management.-Ep.1

Half of the Bees Dead.—About 1% of the bees in this locality are dead, in-cluding nearly all those in box hives. Mine are in movable frame hives, and were wintered on the summer stands, covered with straw, and having ventilation at the top. I lost 4 out of 21, caused by ice forming at the entrance and smothering them; they had plenty of stores.

FRED 1. MERRICK.

Kankakee, Ill.. April 25, 1881.

Bees in Kane Co., Ill .of bees in this part of Illinois are very quiet. Mr. Marvin put up 90 colonies of Italians last fall in his bee cellar, in this city, and has taken out 70 dead ones. Those alive are so weak in bees that they will not be able to do much in the way of laying any expression. in the way of laying up a surplus, no matter what the season may prove to be. His bees in this place were put upearly in November, and were taken out of the cellar on the 22d and 23d inst., both days being quite warm. His aplary at the farm, some 14 miles west of this city, contained about 170 colonies last fall. This apiary was also moved to the cellar early in November, the ma-jority of the colonies having ample stores. The colonies were removed from the cellar on the 23d and 24th About 70 colonies were dead and the balance were in a moderate condithe balance were in a moderate condition. Some of the dead had from 30 to 40 lbs. of honey. To-day, April 25, the soft maples are in full bloom and the prospect for an abundance of white clover is very promising. We fear, clover is very promising. We fear, however, that our strain of Italians will not be able this season to overstock the market with honey. Henceforth we

M. M. BALDRIDGE.
St. Charles, Ill.

Much Encouraged.—I am much encouraged by reading the Weekly BEE JOURNAL, as I have wintered Scolonies successfully, without loss, which is more than my neighbors have done. more than Nearly all I have conversed with have lost heavily. I have double-walled, lost heavily. movable frame hives, and use absorbents over the frames. To these I give credit for my success in wintering

Newton Falls, O., April 25, 1881.

Packed in Wild Hay.—I packed 3 colonies of hybrids in wild hay last November. They had no flight till March, vember. when they were all right. Now the parent colony is dead and one is weak and one strong. L. C. Wemple. Roger's Park, Ill., April 2t, 1881.

Good Results.—I think 23 of the bees in this section are dead. I wintered 50 colonies with a loss of only 2; the balance are in good condition. I owe my ance are in good condition. I owe my success to studying the BEE JOURNAL. My bees were housed 134 days with no chance for a flight. Last year was the best we ever had for honey. The Weekly BEE JOURNAL is a Landevery bee-keeper should have it, just as much se hirreg to keep his burg in bee-keeper snound has as hives to keep his bees in.

C. F. GREENING.

Grand Meadow, Minn., April 20, 1881.

Spring has Come at Last.—The soft winds from the south of last week have taken off the snow and brought mother earth to view, while all the spring birds, frogs, and all animate nature, seem to join in the chorus, singing, "spring has come." This month has been dry up to last night, when we had a thunder storm. Bees gathered pollen for the first time, to-day, on hazel brush. got my bees out on April 23, and gave them an overhauling. I found 12 colonies dead out of 76; they had plenty of honey. The medium colonies wintered the best. The last 2 or 3 weeks told on them; they seemed to think it was time to have their liberty. The ice in the lake holds its own yet, but must soon give way.

M. S. SNOW. Osakis, Minn., April 25, 1881.

Lost 37 out 40 Colonies.—The bees are nearly all dead in this vicinity. I have kept bees for 12 years and never before lost a colony in wintering when they had honey enough; but this win-ter I lost 37 out of 40 having plenty of honey. They died of dysentery, caused from unripe honey, gathered late in the fall. I packed them as usual. I use a box with 3 inches of space on the bottom, and all around the hive, filled with sawdust, leaving the entrance open 14x 2 inches; two thicknesses of carpets over the frames and 9 inches of chaff on the carpet. I like the Weekly BEE Journal very much.

F. F. Alderfee.

Mainland, Pa., April 25, 1881.

Bees in Maine. - We have had rather a hard winter, or perhaps I ought to say, hard spring, in Maine. I think about ½ of the bees are dead; some have lost all, others from ½ to 11-12, and still than or dring. have lost all, others from 1/8 to 11-12, and still they are dying. I have lost 10 out of 50, and may lose more. I tried to winter colonies that were too small, winter colonies that were too small, consequently they could not keep up the heat and have "gone where the woodbine twineth," though I have some of the weak ones that are now gaining in bees. The cause of my "spring dwindling" is old and unprolific queens. I have lost 3 that had plenty stores of honey, and were all clean; and 3 or 4 with dysentery. The bee-keepers of Piscataquis, Penobscot and Somersett counties, met at Dexter, the 14th of eounties, met at Dexter, the 14th of April, to form a Bee-Keepers' Associa-tion, to be called the North Eastern Bee Association, of Maine. They chose officers, and in consequence of the bad onders, and the consequence of the badgoing and the small attendance, will meet again on May 12.

LUCIAN FRENCH.

Dexter, Maine, April 2t, 1881.

Good. - I wintered 62 colonies and lost but 2, leaving 60. Some in this locality have lost all their bees, others ½, but as a general thing ¾ of the bees are dead.

B. F. SANFORD.

Plover, Wis., April 22, 1881.

#### SPECIAL NOTICES.

Single copies of the JOURNAL are sent postage paid for 5 cents each.

The attention of bee-keepers is directed to the advertisement of C pion Bee Hive Manufacturing Co.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

The Volume of the BEE JOUR-NAL for 1880, bound in stiff pape covers, will be sent by mail, for \$1.50.

When changing a postoffice address, mention the old address as well as the new one.

We have prepared Ribbon Badges for bee-keepers, on which are printed a large bee in gold. Price 10 cents each, or \$8.00 per hundred.

Notices and advertisements intended for the Weekly BEE JOURNAL must reach this office by Friday of the week previous.

We can supply but a few more of the back numbers to new subscribers. If any want them, they must be sent for soon.

Constitutions and By-Laws for local Associations \$2 per 100. The name of the Association printed in the blanks for 50 cents extra.

Food for the Brain and Nerves that will invigorate the body without intoxicating, is what we need in these days of rush and worry. Parker's Ginger Tonic restores the vital energies, soothes the nerves and brings good health quicker than anything you can use.—Tribune. See other column See other column.

The date following the name on the wrapper label of this paper indicates the time to which you have paid. In making remittances, always send by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, and local checks, are not taken by the banks in this city except at a discount of 25c., to pay expense of collecting them.

Premiums.—For a club of 2, weekly we will give a copy of "Bee-Culture;" for a club of 5, weekly, we will give a copy of "Cook's Mannal," bound in cloth; for a club of 6, we give a copy of the Journal for a year free. Do not forget that it will pay to devote a few hours to the BEE JOURNAL.

At the Chicago meeting of the National Society we were requested to get photographs of the leading apiarists, to photographs of the leading apparists, to sell to those who wanted them. We can now supply the following at 25 cents each: Dzierzon, the Baron of Berlepsch, and Langstroth. The likeness Mr. Langstroth we have copied, is one furnished by his daughter, who says, "it is the only one ever taken when he was in good health and spirits." We glad to be able to secure one of such a satisfactory nature.

Sample copies of the Weekly BEE JOURNAL will be sent free to any names that may be sent in. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

It would save us much trouble, if all would be particular to give their P.O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name. Many others having no Post-office, County or State. Also, if you live near one postoffice and get your main at another, be sure to give the address we have on our list. dress we have on our list.

## Books for Bee-Keepers.

Sent by mail, postpaid, on receipt of price, by

THOMAS C. NEWMAN. 971 West Madison Street, CHICAGO, ILL.

Cook's Maronal of the Apinry.—Entirely rewritten, greatly enlarged and elegantly illustrated, and is fully up with the thines on every conceivable subject that interests the apiarist. It is not only in structive, but intensely interesting and thoroughly practical. The baok is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper, \$1. Quinby's New Bee-Keeping, by L. C. Root The author has treated the subject of bee keeping in a manner that cannot full to interest all. Its style is plain and forcible, making all its renders sensible that the author is master of the subject. \$1.50.
Novice's A BC of Rece-Culture, by A. I. Root

Novice's A HC of Bee-Culture, by A. I. Root This embraces "everything pertaining to the enre of the honey-bee," and is admide to beginners and those more advanced. Cloth, \$1.25; paper, \$1.00.

those more advanced. Cloth, \$1,25; paper, \$1,00. King's Rec-Keepers' Text-Hook, by A. J. King.—This edition is revised and brought down to the present time. Cloth, \$1,00; paper, 75c.

Langstroth on the Hive and Honcy Rec-This is a standard scientific work. Price, \$2,00.

Micseed Hees, by John Alben.—A romance of bec-keeping, intl of practical information and contagious enthusiasm. Cloth, \$1,00.

Regering, and plants and the stage of the Apinry, by Thomas G. Newman,—This pamphlet embraces the following subjects: The Location of the Apinry, by Thomas G. Newman,—This pamphlet embraces the following subjects: The Location of the Apinry. Honey Plants "Queen Rearing Feeding—Swarming Dividing—Transferring-Hahamzing—Introducing Queens—Extracting—Quieting and Handling Bees—The Newest Method of Preparing Honey for Market, etc. It is published in English and Geronan. Price for either edition, 40 cents, postpaid, or \$3.00 per dozen.

Fand Adulteration; What we cat and should not eat. This book should be in every family where it ought to create a sentiment against the adulteration of food products, and demand a law to protect consumers against the many health-destroying adulterations offered as food. 200 pages. Paper, 50c.

The Dzierzoo Theory; -presents the funds-

The Dzierzoo Theory; presents the funda-pental principles of bee-culture, and furnishes a ondensed statement of the facts and arguments by hich they are demonstrated. Price, 15 cents.

which they are demonstrated. Price, 15 cents.

Honey, as Food and Medicloe, by Thomas o,
Newman.—This is a sumpblet of 24 pages, discoursing
upon the Ancient History of Bees and Honey; the
nature, quality, sources, and preparation of Honey
tor the Market; Honey as an article of food, giving
recipes for making Honey Cakes, Cookies, Puddings,
Foam, Wines, &c.; and Honey as Medicine, followed
by many useful Recipes. It is intended for consumers, and should be scattered by thousands all over
the country, and thus assist in creating a demand for
honey. Published in English and German. Price
for either edition, 6c.; per dozen, 50c.

Wintering Hees.—This pumphlet contains all

or either ention, oc.; per dozen, 50c.
Wintering Hees.—This pamphlet contains all the Prize Essays on this important subject, that were read before the Centennial Bue-Keepers' Association. The Prize-#5'in gold-was awarded to Prof. Cook's Essay, which is given in full. Price, 10c.

The Hive I Use Being adescription of the live used by G. M. Doolittle. Price, 5c.

Extracted Honey; Harvesting, Handling and Marketing.—A 24-page pamphlet, by Ch. & C. P. Dadant, Hamilton, Ill. This gives in detail the methods and management adopted in their apiary. It contains many useful bints.—Price 15c.

It contains many useful bints.—Price 15c.

Practical Hintsto Kec-Keepers, by Chas. F.
Muth; 32 pages—It gives Mr. Muth's views on the
management of bees, Price, 10c.

Kendall's Horse Book—No book can be more
useful to horse owners. It has 35 engravings, filustrating positions of sick hoses, and treats all diseases
in a plann and comprehensive manner. It has a large
number of good recipes, at table of doses, and much
other valuable horse information. Paper, 25c.

Chicken Cholera, by A. J. Hill.—A treatise on its ause, symptoms and cure. Price, 25c.

Ropp's Easy Calculator.—These are handy tables for all kinds of merchandise and interest. It is really a lightning calculator, nicely bound, with slate and pocket for papers. In cloth, \$1.40; Morocco, \$1.50. Cheap edition, without slate, 50c.

The Cronening Culmination! A \$5 Book for \$2 5011

#### Keeping Bees for Profit.

E. A. THOMAS.

The apiarist who is keeping bees solely for profit will do well to examine his stock and see if he has a hardy, pro-lific and industrious strain or not. If he finds them deficient in this point, he should at once introduce new blood into his apiary, for, as far as dollars and cents are concerned, the hardy, prolific and industrious strains are the ones to have, and all other considerations should be thrown aside.

First, I consider hardiness a very essential auxiliary in a grad here we have a some consideration.

first, I consider nardiness a very essential quality in a good honey stock, for here in the north we frequently have very severe winters, and we rarely have a very mild one. Now, what we want is a race of bees that will stand this cold climate and come through strong and vigorous in the spring for heavy every and vigorous in the spring, for how can anyone expect good results during the honey harvest if his bees just manage to live through and sometimes hardly do that ?

In looking over the JOURNAL I no-In looking over the JOURNAL I notice that a large number are reporting their bees ½ and ¾ dead. Well, when I read such reports I always think that the rest of them might as well be dead, for all the good they will do their owner the coming season. Why is it that some have good success in wintering, in cellar and out, in all ways and under all conditions while others less.

they have in a manner become accli-

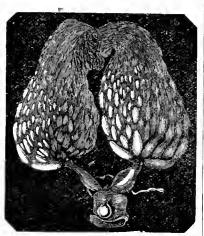

mated.

The second point of excellence in a good working stock is prolificness. After we have wintered our bees safely, and find them in good condition in the spring, the next thing to do is to get them to breed up rapidly so that when the boney comes they will be ready forit.

Now in regard to the third point, industry. Of course a strong colony of lazy bees will be of no more value than a mere handful of industrious ones. Some years ago I had a very strong colony which kept their hive full of brood and crowded with bees, but not 10 lbs. of surplus did I get from it all through the season, while from one that stood beside it I obtained 80 lbs.

As to which of these 3 excellent qualities is the most important is hard to tall, for of converge or industries grain.

ities is the most important is hard to tell; for of course an industrious strain that will not winter well is of no more value than a hardy and prolific one that will not work. It is only when we can combine all these that we can hope for the best results. Several years since, I determined to see what I could do in the way of improving my own stock, and after keeping a close record of my queens, and using the greatest care in

Egg Tubes of a Prolific Italian Queen.

rearing and mating them, I began to see a marked improvement. I have now bred up a strain of bees that, while they excel in the 3 most important points, viz: hardiness, prolificness and industry, have lost none of their color. I agree with the editor of the BEE JOURNAL, that it is not necessary to breed dark colored Italians in order to obtain the above results. obtain the above results. I never rear any queens to sell that I would not introduce into my own colonies and so have no poor drones hatching in nuclei. To this fact I attribute much of my success. I would advise all those who have had no experience in rearing queens to go carefully. Procure some good stock and after proving it to be what you want, endeavor to keep it up to the required standard of excellence. Many an aniarist after securing at ing, in cellar and out, in all ways and under all conditions, while others lose their bees no matter how careful they are, or in what manner they winter them? Simply because some have a good, strong, hardy race that has become acclimated to this cold climate, while others have a weak, puny one will bring nothing but disaster to their owner. For this reason I would caution beginners in bee-culture against investing too much in Cyprians until

work, I believe Mr. Newman's predictions will come true, and the Apis Americana will be the coming bee.

Coleraine, Mass., April 15, 1881.

#### Apis Dorsata not to be Found in Java.

Again are we indebted to Mr. Jones for copies of private letters, of recent date, from Mr. Benton. We give them entire, as the bee-keepers of both continents are awaiting the result of Mr. Benton's mission with interest. It will be observed that after weeks of laborious toil and suffering many hardships, be has been unable to find the coveted prize-Apis dorsata.

Soerakarta, Vorstenland, Java, March 7, 1881.

MR. D. A. Jones, My Dear Sir:—I have delayed writing somewhat later have delayed writing somewhat later than I intended to have done, hoping each day that I could report greater success, but thus far I have not caught a single glimpse of Apis dorsata nor any bee but the Trigona and Apis Indica. I have traveled over much of the west part of Java and have penetrated to the interior of the Island where the na-tive Javanese princes are still holding tive Javanese princes are still holding sway, having, with their war-like adherents, given the Dutch government so much trouble that at last, to settle the matter, the government assigned each an interior province.

I have climbed several mountains in I have climbed several mountains in my search, and once reached a height of 10,000 feet upon a volcano, after a weary march up, up, through dripping, tangled vegetation, over rocks, and through streams, seven hours constantly upward, my way lit by a torch, for it was night, because if I left the foot of the determined to the later to the later. dormant volcanic mountain in the day time I would have the heat of the day for my upward journey, and then find the mountain enveloped in clouds after

then in the morning.

This mountain journey did not show me a single bee, although the morning It came down was a bright warm one; moreover, I became convinced that it would be rare indeed to find in the west of Java primeval forest any bees of the genus Apis. This was the first time that I had reached the thick primitive forcet and I found it far different from forest, and I found it far different from anything I had previously seen. To understand it you must first know that for the most part, these people live in villages as do the peasants of Cyprus and Palestine, and beyond the district where there are villages they propher where there are villages they rarely or never go. Now, on these mountains it never go. Now, on these mountains it rains almost every day in the year and the air is, except on the summits, never cold; thus you will be ready to comprehend that a primitive forest in Java is composed of giant trees filled in with a thick undergrowth of bamboo and the whole intentional with rings 25 thick

of the trees are hollow; there are many flowers that would attract the namy nowers that would attract the bees. At last in my search I have reached the very heart of Java, but see no great encouragements here. No one seems to know anything of any bee but the common bee of East India—Apis Indica—which is here very yellow, and is account to the common of the second to the common of the second to the common of the second to the second t and is everywhere to be seen on sweet

substances.

Had it not been for the bees I brought with me I would not have staid many days in Java, but they would very likely—some of the colonies I mean, have played out soon had I not remained here to care for them every few days. Of course these people—the Dutch oficials do not know what constitutes a strong colony of bees, and thus far I have, by equalizing, kept the queens alive, and when I hast saw them about 3 or 4 days ago they gave very enconraging signs. I asked 60 guilders each for the colonies, that is £5 each, agreeing to stay in Java and to care for them ing to stay in Java and to care for them two weeks. At the end of that time I saw that it was going to be very risky as regards the life of some colonies so I offered to stay two weeks more if they would pay my expenses; they were glad of the chance and the principal of the school sent in the account at 75 guilders for each colony. The additional 15 on each colony will more than pay my expenses, that is to say much more than pay my hotel bills during the additional that we week.

pay my hoter offis during the additional two weeks.

I think the account will be so allowed and that when I get back to Buitenzorg the money will be ready for me. After about a month in Java I have about concluded that if I should be fortunate enough to secure a few colonies of Apis dorsata, they will cost, in addition to what I have already paid out, a very large sum of money, and will consume much time; therefore I believe my best plan will be to return to Ceylon and go into the interior (by rail) of that I sland, where, from all accounts, I feel pretty sure Apis dorsata is to be found in some numbers. If, however, I do not get any number there, a trip to the neighboring coast of Hindustan remains as another chance. If I had two months' time, chance. If I had two months' time, a trip to Timor would be the thing to do, for there Apis dorsata surely abounds. But Timor is about 1,000 abounds. But Timor is about 1,000 miles further east and steamers rarely touch there. I might go to Macassar, but that trip would occupy at least a month, and Celebes is a large, very spread-out Island, so that I might search a long time before getting Apis zonata or dorsata. Bandjermassin, in Borneo, is nearer, but except I could catch a trading vessel going there it is not so easy to reach as Macassar. There are many bees in some parts of Borneo, I am told by the most practical, intelligent government officers I have methere. It seems, misled by the universal statement, I have come to the very island where Apis dorsata is as rare as it could be and still exist as a race of bees on the island.

No one can be more anxious to see this park here there is a not of the start.

No one can be more anxious to see this new bee than I, and yet after nearly 4 weeks in Java I am obliged to say I know no more about it than when I first came here. That I have endured more hardships in my endeavors to find it you can see from what I have said it you can see from what I have said before, and will know from the state-ment of the fact that I have sometimes scrambled through thick mountain for-

ests and over sharp rocks for many sucests and over sharp rocks for many successive hours, my clothes soaking wet so that I dared not rest a moment; again, an all-night coach ride over fearful roads would give me a chance to—to keep my eyes open, and still again it has been my lot to get caught miles from shelter in a pouring continuous rain. It is wonderful how the water falls here.

But I believe Apis dorsata will return with me. You know I'm not the chan

But I believe Apis dorsata witi return with me. You know I'm not the chap to leave the matter untested when I have got thus far. Either I will get Apis dorsata in Ceylon or go to the main-land of India for it. I have seen two combs of Apis dorsata, from the Malay peninsula, and Mr. Schroeder writes me he received "bees of all sizes—worker bees as large as common queens, from Calcutta." queens, from Calcutta.

have received many encouraging I have received many encouraging words from European bee-culturists, though many of them are doubtful as to the success of the undertaking. "At least we shall know," says one of them. "I am very anxious to get news from you so as to be able to repeat facts, for them for me have had only suppositions." thus far we have had only suppositions.

I will write again soon. Thus far no letter has been received by me from you since leaving Cyprus. It is a long time since the last letter from my wife was written.

Very Truly Yours,
FRANK BENTON.

Here is another letter received from Mr. Benton:

Steamship "Yangste," Mr. D. A. Jones, Dear Friend:—We getting toward the Island of Ceylon which place we expect to reach to-morrow night or next day early. I shall stop there until the arrival of the next stop there until the arrival of the next steamer, to put in shape and deliver to the parties ordering them the colonies of bees I left there upon my way to Java, and what is more important to me, to seenre if possible a number of colonies of *Apis dorsata*. Landing in Colombo I will proceed to Kandy, in the interior, and have very great hopes of finding somewhere in the vicinity of that place the Great East Indian Bee." I regret exceedingly having spent so

I regret exceedingly having spent so much time and money in Java, yet it could not be foreseen how it would result, and it was only after I had been there and made a thorough search of West Java that I became convinced that the bees were rarely to be found in that part. I then had but a short time to spend before leaving for Singapore, and so a journey to Timor, the only place where one is certain to find large rapplying of these bees two out of the place where one is certain to find large numbers of these bees, was out of the question. I therefore went to the east-ern part of Java and explored the in-terior forests, but with no avail. The bee that has been so often spoken of as "The Great Bee of Java," as to lead one to think it was common there, is only seen there in very rare instances, and during 5 weeks of constant search and during 5 weeks of constant search I could not get a glimpse of a single bee. I used every available means, sometimes having as many as a dozen men out searching after the bees and questioning all the natives who ever saw a tree containing one of these swarms. That these mendid their best saw a tree containing one of these swarms. That these mendid their best you may be certain for the one who found or learned of the first tree con-taining a swarm of these bees was promtaining a swarm of these bees was promised, in addition to his day's wages, a bright English sovereign, quite a prize for a simple Islander. The second was to have half that sum; moreover, they were anxious to please me for they got good pay and wanted a continuance of their employment. But it was no avail; the bees were not to be had, and after weeks of toiling through interminable forest, up mountains and over rocks, in the wildest most out-of-the-way places, I gave up the search in Java as

While in Java 1 returned from time to time to Buitenzorg, where the colonies of Cyprian and Palestine bees which I had sold the government had been placed, and thus kept them in order. I left them a few days since in a promising condition. The introduction of the culture of bees into Java is a matter of considerable importance to

petticoat made of three or four yards of very wide cotton cloth. In the manufacture of surougs the wax is spread upon a portion of the surface of the cloth and the latter is then dropped in the dye; after the wax has been washed out the parts not covered with it are found to be colored. The process is repeated for each part that is to receive a distinctive color.

a distinctive color.
Some years ago the Dutch government sent out from Holland a man with 28 colonies of Cyprian and Italian bees for which a special cabin costing \$100 had been built upon the deck of one of the Dutch mail steamers. During the voyage several kilogrammes of ice, a costly article in the tropics, were daily used in this bee cabin to lower the temperature. Upon arrival in Port Said it was found most of the bees were dead: the remainder were then given Said it was found most of the bees were dead; the remainder were then given a few hours to fly and then sent direct to Batavia, where but 5 colonies arrived alive and these were very weak and much diseased. In a few months they were also pumbayed with the rived alive and these were very weak and much diseased. In a few months they were also numbered with the things that were. Thus this expensive experiment of the Dutch government was productive of nothing but experi-ence. After about 3 years in Java, without having made any effort to se-cure or ascertain anything about the cure or ascertain anything about the large native bees, Apis dorsata, this enterprising Dutch bee-keeper returned to his native land, to which he had rendered and a part convict. dered such a great service!

It was of course a great mistake to take bees from Holland when they might have been obtained in Italy, or Cyprus, or even in Jaffa, but 12 hours from Port Said. Then the building of this special cabin was not necessary, since, shaded with canvas and in the open air of the decks they would be quite as well off. It was not only an unnecessary expenditure they made for ice, but I believe positively injurious, for it made the bees damp and diseased. In this climate the great question is to keep things dry, for when once an article is damp it begins to mold very soon. Clothes hanging up in a room or soon. Clothes hanging up in a form of carefully laid away in bureau drawers, completely spoil in a short time, sometimes but a few days.

Another mistake in this experiment was to take the bees direct from Port Said to Batavia. They should have gone by the way of Ceylon and there been allowed a flight. The journey from Port Said to Batavia is about 25 days will be Caylon it is 17 days. days, while to Ceylon it is 17 days, quite long enough in this fearfully hot

climate.

It is strange indeed to see how little Europeans in this part of the world trouble themselves regarding the development of the country. Most of them once in their positions live at their ease, letting things move on as slowly as they may. In general they drink more, smoke more, eat more, lounge about more, read less, study less, think less than work less than white seather. less and work less than white people in any other part of the world I have visany other part of the word I have visited. You can readily understand that I could get not only no practical aid but absolutely no information that I could make use of, indeed, it was with the greatest difficulty that I could ascertain anything about those parts of the country that I did not visit.

anything about those parts of the country that I did not visit.

A very natural inquiry for one in America to make is, "but why did you not go to Timor where it is certain these bees are plentiful?" First, as before indicated, I had every reason to suppose I would secure the bees in Java, then I brought with me the Cyprian and Palestine bees for the Dutch government in Java. Moreover, it government in Java. Moreover, it would be necessary to visit Java in order to get a steamer for Timor. The latter can only be obtained at rare intervals and the time one can get a re-turn steamer is not certain, besides all turn steamer is not certain, besides an this it is a long journey from Java, much longer, I do not doubt, than people naturally think it to be. From Batavia to Timor is 1,500 miles, or this journey is quite as long a one as that from New York to the West Indies, but it is not expected as a supply that the better that the provided as a supply to the supply the supply that the best transfer to the supply that it is not completed as quickly as the lat-ter, because the steamers do not go di-rectly to Timor, but visit various is-

started from Cyprus and the time it takes to go and come, it was out of the question to go to these islands unless I gave up the idea of getting back to Cyprus in time to accomplish anything there this year. I am late enough now, but it was the best I could do, and now if I would not go back without taking any bees I must stay 2 weeks in Ceylon. These bees are to be had in this part of the world but you must bear in wind

of the world, but you must bear in mind of the world, but you must bear m mind that in this particular the country is unexplored, no bee-keeper ever having examined it before, and it takes some time to find them. Then it is a long way between the countries and islands of which we speak in a breath as though they were near neighbors. You know yourself, through experience, what a long, long journey it seemed to cross, the Atlantic Ocean, yet when I shall have arrived in Cyprus I will have traveled on this journey a distance equal to 6 trips across the Atlantic. Thus having left Cyprus late, and not knowing positively the very best course its lateral or the course of the to pursue, it having been an impossionity to ascertain anything about this subject before coming to the Indies, the time has been too short to accomplish what I wished to do. The only to pursue, it having been an impossibilway I see to get a large number of these bees is to come here and be prepared to remain for some time, then go to the place where they are most abundant and rent a house to live in—hotels and traveling about are expensive here, especially for foreigners.

One of the most troublesome things which first presented itself was the finding of an interpreter. Only natives connected with the government learn any foreign languages and even few of any foreign languages and even few of them do. I could see no other way to get along, so I bought a book and commenced to learn the Malay language, meanwhile, the Director of the Department of Public Instruction gave me as interpreter a young Malay who could speak a little Dutch. It seemed preposterous to think of one's commencing to learn a language in the loop of speak. learn a language in the hope of speaking it in 10 days or so well enough to make transactions with people who knew no other tongue. But the Malay tongne is so very easy, so exceedingly simple, that in 2 weeks I could get along yeary well and now after 6 weeks I. very well, and now, after 6 weeks, I can ask all about the bees. I derived can ask all about the bees. I derived much aid in getting along with my var-ious journeyings through my acquain-tance with French, German, Dutch and with the Malay I learned. In fact, with Fnglish alone one would get along but poorly in those lands outside of British India, while even in British territory, French and the native language are of very great importance to the traveler.

Mr. Schroder, Mr. Cori, Mr. Filbert and many other European bee-culturists, have written me encouraging let-ters, and all speak in highest terms of the work, saying also that they await with intense interest the result of my journey, news of which they all wish me to give them as soon as possible, direct from Java.

Earnestly hoping to give more encouraging news soon, I remain as ever.
Yours Truly, FRANK BENTON.

Foul Brood.

P. B. P.

The former article which I wrote to the BEE JOURNAL was intended to induce apiarists to investigate the disease of foul brood more, and to leave noth-ing unturned to set it in as clear light as possible. I am of the opinion that the subject is one that has not been sufficiently clearly investigated, and what has arisen from a want of a proper understanding of this important subject has been misunderstood for a hereditary disease in bees.

The colony which I referred to in my former article was a very strong one, a large quantity of bees clustered on the outside of the box for some days preoutside of the box for some days previous to swarming, there were also a number of drones in the colony, and the combs were tilled with larva unsealed. When they swarmed the bees nearly all

left without food, hence they died and I found them in the state described in my former article. I allowed the box to remain in its place to see what would be the result, which was as I before stated.

Another source of the disease is explained by II. L. Jeffrey; this is certainly the effect of want of proper

iadgment

As I believe much of this disease is As I believe much of this disease is caused by improper treatment in the winter and spring I will now explain how I treat mine, which has been attended with good success for the last 9 years.

I winter mine in a house, in the walls of which there is 9 inches of sawdust, and 12 inches over the ceiling; there is a ventilator in the floor and another in a ventilator in the floor and another in the ceiling, both valves of which I can open and shut at pleasure. I have a door outside and another inside which fits close; the house is kept quite dark; in it I have shelves on which I place the bees. I endeavor to keep the tem-perature from 1° to 7° above freezing point, but in the spring when it is likely to rise above that temperature before I remove them from the house, I place a large tub in it in which I put ice to prevent too much warmth, so that the queen than the bees will cover. When I take them out in the spring if the nights are cold I take the weak colonies into the house and I close the entrance of the others, leaving a small aparture for air so that the bees can ventilate themselves, and in the morning I open them serves, and in the morning I open them to suit the strength of the hive; in this way morning and evening having attended to them I believe I have prevented foul brood in the spring.

In my winter bee-house I have not lost 6 colonies for 9 years, and by the above care and attention I find I have very little spring dynalling. I have

very little spring dwindling. I have wintered some outside and I do not remember losing one, but it would make this article too long to explain it here.

When I find a colony have nearly all left in swarming and a large quantity of larvæ is left in the combs, I imme-diately artificially swarm one into the which effectually prevents foul

There may be other causes for the bees leaving their young to perish and hence causing foul brood, which we have vet to learn.

#### Foul Brood and Feeding Rye Flour.

H. L. JEFFREY.

When I wrote the article on fonl brood published in the BEEJOURNAL of March 16th, it was not my own situation that I described, but the result of close observdescribed, but the result of close observations in an apiary a few miles from me, and in which I have worked a great many days since 1873, and it is only one case out of quite a number that I can give the details of, if it was necessary.

Another cause that has shown quite strong evidence is wet and melly het

strong evidence is wet and moldy bottom boards, and I find that there is a difference in wood about the effect— some holding moisture and molding more than others, and this dampness also causes dysentery and spring dwindling to a great extent; at least a great many experiments that I have tried duthe past 4 years prove it sufficiently to establish a rule to go by. First, if the bees are kept perfectly dry, they will not be apt to be troubled with the black mold. This mold emits the same black mold. This mold emits the same kind of gas or poisonous effluvia that is found in wells, deep holes, and in some cellars. This gas is death to all animal life in a greater or less degree. This is also one trouble that is caused by the hives standing on the ground in cold, damp places, and in such I have found spring dwindling, foul brood, dysentery, and black model moves them in any other. and black mold more than in any other locality that I have found. I prefer a low stand to all others, yet I have taken particular notice of the great difference, other things being equal, between colonies kept where the soil was heavy, black, wet ground. Those kept on a bench 2 feet high would be as much as 2 weeks ahead of those on the ground, matter of considerable importance to the Island, since, as I am credibly informed by a dealer in wax, \$800,000 worth of wax is yearly used by the 22, 600,000 people living there, whose principal garment is the saroag, a sort of a sidering the time I was able to get left), consequently the young bees were solven and the colonies on the ground, and the colonies on the ground would dwindle twice as bad as those standing on a high bench; on the other hand, the

colonies standing up would fly out worse and be lost on the snow during the sunny and be lost on the snow during the sunny days in winter, and be lost in the early spring blustry days. On the other side of the question, where the soil was gravelly and of a leachy nature, there was just as much difference in the flying propensities, but those on the ground would come on as fast, and in as good season as those that stood on a bench, consuming less honey and wasting less by snow or wind. Now, the two locations need reverse treatment in the spring and fall, while in summer they can be the same. I have noticed the above points closely for about 5 years, taking notes of same. I have noticed the above points closely for about 5 years, taking notes of circumstances and comparing dates and

There are two things that I have nothere are two things that I have noticed regarding wintering—dysentery and spring dwindling—and find they are alike, in all cases and situations, attributable to the same cause, though situations will cause some difference in time, but the cause and results are the cause. same. 1st. Colonies on 3 or 4 year-old brood combs, as a rule, are the safest for wintering, the paper making them better absorbents of moisture from the beets, and the warmth of the bees will dry them out. 2d. Bees with aquantity of bee-bread invariably have the dysen-tery when long confined, especially in damp weather when the bee-bread sours and ferments some; it is then fed to the larvæ, and some foul brood is the result. But few cells may show at first, but if But few cells may show at first, but if the bees have a good supply of combs, the disease will make progress fast enough. On the other hand, if they are given no more combs than they can cover, there is not so much danger of trouble. Now, to keep out of the trouble, box all the honey you can or extract it, feed sugar syrup, and be sure that there is no pollen in the combs after Dec. 1st. For the latitude of Connecticut or north: Give the colonies as old Dec. 1st. For the latitude of Connecticut or north: Give the colonies as old combs as you have; try to contract them to 5 Langstroth frames or their equal, that is for ordinary colonies; pack them well at the sides, then lay several strips of lath across the frames to reach from of lath across the frames to reach from one division board to the other. On these laths put a piece of pasteboard or paper box that will reach two-thirds the length of the top bars, lay on your quilt, and put on the chaff cushion and cap, and be very sure to put a chaff cushion under the bottom board every time. If you do not like this idea, just knock out the under-pinning from your house, and experience how cold and disagreeable it is, or sleep on the slats of house, and experience how cold and disagreeable it is, or sleep on the slats of your bedstead, piling the bed-ciothes on the top and sides of you. It is the same principle exactly. Then let them alone till about the 1st, of March, and after they have a good flight look them over. If they can spare a comb take it away, and insert a division board. Before closing them up, rub at least half a gill of good, sweet rye flour into one of the center combs—a gill will not hurt a or good, sweet rye nour into one of the center combs—a gill will not hurt a strong colony—then tuck them up and shut up the hive. The queen will begin to lay immediately, and in as many cells as the bees can cover.

Let the hive alone till the 1st of April, then beak it expended with the content of the co

Let the hive alone till the 1st of April, then look it over and you will find a nice lot of young bees. If the bees are not gathering pollen give them some more rye flour, and your colonies will be strong and healthy. The result generally is early swarms or a good surplus. I have tried feeding sugar syrup in the fall and rubbing rye flour in the combs in March and April, with some of my colonies for the past four years, and every time it has proved a success. This year they are the only ones that are proof against the scourge of this ever-to-be-remembered disastrous winter.

Using Separators for Surplus Honey. GREINER BROS.

It appears from Mr. Heddon's reply in the Weekly of April 6th, that he misall the Italian exporters are rearing their funderstands the meaning of our article on "Use of Separators for Surplus Honey." We read the Bee Journal with the expectation of gathering in Italy where they had been allowed to formation, and the few articles we have contributed to its columns we hoped might benefit some of its readers. We late the latent exporters are rearing their funders are rearing their funders are rearing their funders are rearing their funders. It is unded dry, and every sound berry will be found just as you left it and the same bees as busy on some other clusters and the charges which have been against them; this is the more important that the latent exporters are rearing their funders. It is unded dry, and every sound berry will be found just as you left it and the same bees as busy on some other clusters, doing a better business.

This simple test, if properly conducted, will satisfy you that you were in error. What would you think if one of your city cousins should come running from the contribution of the charges which have been against them; this is the more ing, as the majority of it com will satisfy you that you were in error. What would you think if one of your city cousins should come running from

did not disagree with Mr. Heddon for the sake of being on the contrary side, but our argument was sincere, and based on actual observation. The fact that Mr. Heddon claims "they sometimes kindly attach the sides of the combs to them" to be an argument against wooden separators, is sufficient proof to us that he does not speak from experience.

that he does not speak from experience, but merely to sustain his argument.

We are not aware that we declared against tin, as intimated by Mr. Heddon; we only gave the reasons of our individual preference for wood. That Mr. Heddon considers himself a "Galileo" is undoubtedly true, but the comparison does not seem to have any bearing on the subject. The BEE Joulnnal, as a progressive apiarian periodical, stands too high and is too valuable, in our estimation, to be used as a debating medium. We wantfacts and actual observation. If we should differ in our views, let us discuss such questions in a friendly way for our mutual benefit.

Naples, N. Y., April 11, 1881.

#### Bee Diseases, Spring Dwindling, etc.

s. s. butler.

G. M. Doolittle says to Novice: "Can't you manage to tell us why bees did not spring dwindle prior to 1870?" Further along he says: "I can't see through it all," and Novice says: "I can't either."—Page 68, Gleanings for Feb., 1881. With a great deal of hesitation, after the veterans Doolittle and Novice give it up, I will try and tell what seems to me to be the reason; it is simply this: the bee has lost so much vim or vitality that it is not able to stand is simply this: the bee has lost so much vim or vitality that it is not able to stand the cold as it used to. I will try to prove my position. I was in Eastern Pennsylvania in the fall of 1872, and knew two bee-keepers with nearly 100 colonies each in common hives, who kept them in the old-fashioned way, by brimstoning the poorest, keeping the best, and so keeping up the tone of the colonies, so that when the first disastrous winter came their bees were not affected, because there was not a pseudo scientific bee-keeper near enough to them to lower the tone of their bees by dividing and thus rearing poor queens, which would

the tone of their bees by dividing and thus rearing poor queens, which would rear poor drones, and thus lower the vitality of his neighbor's bees.

Mr. Doolittle gives his own case as one where he had to stop rearing queens by the quantity, and pay attention to quality, before he could get honey returns. I have never been able to get anything of account from my bees until I got the best stock I could procure and reared my bees by natural swarming. Hear Henry Alley on this subject, although he does not seem to take the same view of it that I do. On page 42, Ber Journal of Feb. 9, 1881, he says: "I have found farmers who have kept bees in the same place upwards of 40 years without indications of deterioration." I think they will always be found farmers who have been to the total though the same place upwards of 40 years without indications of deterioration." I think they will always be found far enough away from frame-bive beekeepers, so that drones from the divided bees have not mixed with their

bees.

If our friends will look around in the cold Northern States, they will find old-fashioned bee-keepers, where away from fashioned bee-keepers, where away from new-fashioned ones far enough to keep the bees from mixing, also away from sorghum and cider mills, and do not get grape, peach or apple juice, or honeydew in quantities, are still wintering their bees well. Bees are no better by being kept in the old-fashioned than in a frame hive, if allowed to swarm in the frame hive; but it is impossible for an old-fashioned bee-keeper to keep his stock good, if others near him divide an old-fashioned bee-keeper to keep his stock good, if others near him divide theirs and rear forced queens. "Five hundred dollars would not hire me to breed all my stock from an imported mother and let my present stock go down."—Doolittle, page 21, Jan. number of Gleanings. Why are imported Italians getting below our best American yellow bees? For the reason that all the Italian exporters are rearing their queens by the forcing process, for quan-

the one colony of Italians, and stocked his large apiaries, sold quantities of queens, and still has good bees after a quarter of a century? Dzierzon's experiment is a very strong argument in favor of in-and-in breeding, as are also the qualities of the Cyprian and Pales-tine bees, where they have bred in-andin for ages. Dzierzon's success is because he is a real scientific apiarist.

cause he is a real scientific apiarist.

What say the Hanoverians (bottom of third column, page 30, Bee Journal of Jan. 26, 1881)? They think they rear a finer bee by destroying \(^1\_3\) of their bees, thus renewing all their combs every three years, and avoiding foul brood.

I would like to inquire of Mr. Jones or Mr. Benton if they heard of foul brood in either Cyprus or Palestine. My opinion would be that a colony of either Cyprians or Palestine bees would not take or catch foul brood, if fed with foul broody honey, because they are naturally so vigorous. To try the experiment, I should want my queen reared naturally, from a locality where they were all reared the same way. they were all reared the same way. am glad to see that a few of our best apiarists are giving the necessary atten-tion to their bees, so that others can tion to their bees, so that others can get queens that will be an honor to the breeder.

I am getting quite well pleased with the change in the BEE JOURNAL; I had been used to the Monthly so long that I the the Monthly so long that I at first disliked the change; but now would be very much opposed to having it relapse into a Monthly again. I have just taken out of the hives about 150 lbs. of honey, 13 of which was new, showing the bees to be very forward for the time of year. the time of year.

Los Gatos, Cal., March 3, 1881.

For the American Bee Journal.

#### The Bee and Grape Controversy.

L. JAMES.

Several years ago this same charge was brought against our bees by the vineyardists, and I supposed the evidence adduced then by the apiarists had proven satisfactory. But another dry fall has been attended with a heavy loss of grapes, and the bees have again been arrigined as the culprits. If hees been arraigned as the culprits. If bees were not armed with such sharp weapons as to be held in dread by many persons not accustomed to handling them there would be but little difficulty in salisfying our neighbors that one in satisfying our neighbors that our bees are in reality their friends, and that the charges brought against them, though appearing so to a casual observer, is an erroneous conclusion drawn server, is an erroneous conclusion drawn from imperfect investigation. I am interested in both branches, and have been for over 20 years, and although losing grapes in the same way as my brother vinedyardist I say to him, that for many years I have settled this matter to my own satisfaction, and in as few words as possible inform him how he can reach the positive fact that bees do not injure his grapes if he will spare one hour or less from his pressing duties and learn one truth that is worth to him more than a dozen "I think so's."

The first dry fall that causes the bees The first dry Ian that causes the bees to gather in countless numbers on your grapes, call in to your assistance some person accustomed to handling bees and not afraid of being stung (as I presume your are), select a cluster of grapes that is so full of bees that you cannot see a grape, then request him to drive them off by blowing his breath strongly upon them and at the same time whipning them with a whish of soft grass. ping them with a whisp of soft grass. Now remove every imperfect or already injured berry. Do this effectually. After having done so step to one side and ter having done so step to one side and the cluster will in all probability be hid from sight by them again. Sit quietly by and rest yourself for a while and you will observe they will begin to leave, and when all have gone examine and you will find the very end of the stems from which you plucked the damaged fruit sucked dry, and every sound berry will be found just as you left it and the same bees as busy on some other cluster, doing a better business.

This simple test, if properly conducted.

your sheep pasture and cry out, "John! John! the buzzards are eating up your sheep!" You would no doubt laugh and say, "That's not so, George." The probability is that your blunt contradiction to his conviction of a fact would probably cause him to retaliate by saying, "Well John, they are your sheep, and if you see proper to let the buzzards destroy them in this way, all right. But I tell you it is a fact for I saw them myself with my own eyes tearing your self with my own eyes tearing your sheep to pieces and eating them, too." I presume such evidence, coming from an honest but decided person, would have but little weight with you. The bees, just like the buzzards, are nature's scavengers in this instance, nothing more, nothing less, and utilize the frag-Who are the real depredators?

Who are the real depredators? With us, first on the list stands the grass-hopper, small in size, great in numbers (in certain seasons) and armed with terrible jaws for just such work. In my apple orchard last fall the apples were badly cut in holes by them and crickets. Grass-hoppers will either eat or cut almost everything on which they crawl or hop. My orchards are in grass, and some seasons the hoppers very numerous. At such times, if clothing is hung up in the orchard it is liable to be damaged by them. Crickets, and other nocturnal insects depredate to a greater or less extent also. The robin and catbird are both on hand in grape gatherbird are both on hand in grape gathering also, but as they render valuable assistance to the horticulturist in obtainsistance to the horticulturist in obtaining his crop of fruit, and as we toil among our vines their outbursts of mimicry or song amuse or elevate our thoughts and we feel disposed to grant them a portion of the crop. The robin, good fellow as he is, should be welcomed to his fill of concords, as he plucks no more than he eats. But when you see the catbird coming, shoot him if you can, and summon all your Christian graces to govern that upruly member—for when grapes are ripe he becomes graces to govern that unruly member— for when grapes are ripe he becomes the meanest bird that wears feathers. He knows just where the best grapes grow, and a second or third rate one he has no use for while a No. 1 is to be had; very unlike the robin, he does not pull off the herry and swallow it whole had; very unlike the robin, he does not pull off the berry and swallow it whole, but takes a nip out of one and then another in his restless way and by the time he has satisfied his appetite he has ruined enough grapes to furnish a host of bees with employment in rescuing the pulp of these damaged berries, until he makes another call. These damaged berries are a few value to the vines. aged berries are of no value to the vine-yardist, then why object to let this right royal insect gather up the fragments from the catbird's feast, that would be

It is well known to persons growing grapes that when the fruit is fully ripe that a soaking rain and a warm atmosphere may cause many of the berries to burst, from the fact that it has ceased to grow and is incapable of sustaining the integral pressure of the extra incomthe internal pressure of the extra incom-

ing flood of sap.

Most bee-men are aware that bees are Most bee-men are aware that bees are able to gnaw such article as paste-board, sacking, and even wood, yet I am satisfied they are unable to cut open the grape. My belief is based upon the following premises: Paste-board, textile fabrics and wood, however smooth, have sufficient elevations on the surface for the jaws of the bee to get a hold, but the skin of the grape is very smooth, somewhat tough and elastic or yielding

somewhat tough and elastic or yielding in its character as to afford no hold to be had, and I have no doubt a practical microscopist could give an illustrated drawing of the mouth of the bee, showing its inability of opening the berry. Again, there is one thing certain, the intense excitement and energy displayed by bees when engaged in this business would not cease when the already open ones were consumed if they had the power to cut through so thin a covering as stands between them and the so much coveted interior. and the so much coveted interior.
Atlanta, Ill., April 11, 1881.

[So far, the preponderance of evidence tends to exonerate the bees from all the charges which have been brought against them; this is the more gratifying, as the majority of it comes from those who are themselves engaged, more

#### THOMAS C. NEWMAN,

EDITOR AND PROPRIETOR.

CHICAGO, ILL., MAY 11, 1881.

#### Food Adulterations from a Hygienic Standpoint.

In March last, Dr. W. S. Haines, professor of chemistry in Rush Medical College, startled the scientific portion of community with an elaborate lecture eulogizing the virtues of glucose, and indirectly defending its universal manufacture and sale as an adulterant. Of course, he scientifically dresses up the stereotyped and popular arguments that grape sugar, as found in the grapes, and glucose made from corn with sulphuric acid, are substantially one and the same, and similar to that made from potatoes and bread in the laboratory of the human stomach. He might have added, also, that chemically speaking, the same product could be realized from a great majority of the garbage to be found in the gutters of our popular cities, but for fear of adding to the prejudice already existing, we suppose, he kindly omitted giving this information. Evidently, the following extract explains the reason for the waste of his valuable time-first, to remove the prejudice from the public mind regarding the use of glucose; second, to beguile the farming community from their opposition to swindling:

I believe it is no exaggeration to say, at the present moment, at least two-thirds of the reading public look upon glucose as a dangerous substance, pos-sessed of highly deleterious or even poi-sonous properties, and I question whether I housewife in 20 could be found who would accept a pound of this sugar as a present, if she were obliged to promise to use it in the household cooking. A recent letter in one of the daily papers expresses, I believe, the average public ignorance in regard to glucose, when it says: "The persons who bave been made sick, and are inwho have been made sick, and are injured for life by its use, are already a mighty host....No wise man wants glucose for food." Another equally misinformed writer says: "...Grape sugar is not only injurious to health, acsugar is not only injurious to leatin, according to chemists, but it is a plain and palpable fraud, because it is not sweet....It is of no possible use except for adulteration."

If, as I have said before, this mistake was like most of the other popular fallacies, a harmless error we might afford.

cies, a harmless error, we might afford to let it travel, confident that it would do no serious harm. But since it threatens to affect a branch of industry which promises, if it be encouraged, to redound to the advantage of every man who owns a farm or who plants an aere of corn, I believe it is high time to discuss the subject, and remove the prejudices against this truly valuable product of chemical skill.

The following paragraph contains the gist of his lecture as to the method of manufacture :

By mechanical and chemical means by meetanical and enemical means the starch is first extracted from the corn and then is boiled with very dilute sulphuric acid, when it rapidly passes into solution and becomes changed into sugar. The chemical action that takes place during this transformation is highly interesting. Both starch and glucose consist of exactly the same elements, carbon, hydrogen, and oxygen, united, however, in slightly different proportions—the sugar containing just enough more of the oxygen and hydrogen to equal the quantity of these elements present in a molecule of water.

was the whole lecture, that many of the better informed and more thoughtful of the readers of our morning papers were not slow to believe the Doctor had other than scientific motives for giving utterance to such a lecture, and he found it necessary in a supplemented letter to diselaim any selfish purpose in preparing it.

A few days after the lecture above referred to, an Iowa farmer sent to one of the daily papers a can of glucose syrup purchased in Davenport, and stated "he and his family had been using the syrup for some time just as they had the ordinary cane syrups, and liked it exceedingly; but, after steady use of it for some time, he discovered that the digestion of every member of the family was ruined, and that something or other, presumably the glucose, because that was comparatively a new article of diet with them, had seriously disagreed with their stomachs." Dr. T. D. Williams, quite eminent as an analytical chemist, after careful examination. made the following report and explanation, to which we give considerable space:

I find the contents of the can to be a solution of starch sugar (grape sugar), and not uncrystallizable starch sugar (glucose) or starch syrup, as alleged.

The reaction is acid. The specific gravity is 1,343, indicating the presence of 75.5 per cent. of starch sugar.

The substance is unusually sweet; a fact showing that the saccharine proptact showing that the saccharine properties have not been destroyed either by heat or by the undue presence of lime (combined with heat), which fact is corroborated by the presence also of free sulphuric acid. I also find traces of sulphate of iron (copperas).

The microscope reveals innumerable delicate crystalline tufts, and larger warty bodies of starch sugar thus in a

warty bodies of starch sugar, thus in a manner authenticating the chemical examination made. It also shows the presence of sulphate of lime and a vast quantity of vegetable tissue (cellulose)

I believe in calling a thing by its proper name. Artificially, no such subproper name. Artificially, no such substances as grape sugar and glucose were ever made. Now, while this may appear to you to be an ultra expression, I am willing to be convinced of my mistake, if I am, indeed, making one, for, as a matter of fact, the terms grape sugar and glucose in their original sense refer to the natural products alone, and not to any artificial ones. Dalton very properly says: "The cane and grape sugars are held in solution in the juice of the plants from which they derive their names." Again, Dunglison defines glucose as being a variety of sugar (uncrystallizable) that occurs naturally (uncrystallizable) that occurs naturally in many vegetable juices and in honey.

Indeed, these terms were subsequently given to the artificial products, and, in my opinion, erroneously so, because of their saccharine properties and their chemical combinations, which, in both instances, are insomeric with the natural product. I say the names are erro-neously given; first, because they are ral product. not natural products; and, second, not being those produced by nature, man has no right to presume upon their possible physiological effect. Assuming that such effect is the same, a thing reently done, because of an alleged fam-

ily patronymie.
Dr. Williams said he believed that the frequent reiteration of the statement that the natural product is wholesome, a truth made use of conjointly with the word glucose, for the purpose of extend-ing the sales of the artificial product. The misrepresentation so constantly persisted in is a question of fact, as is also its avowed purpose. The glucose manufacturers and their devotees, in some few instances ignorantly, but of-tener intelligently, are engaged in misrepresenting the facts, as above stated, and this, too, with but one object in view—namely: that they may uninterruptedly perpetrate fraud. I want you to understand that these men are not so representing the facts, as above stated, way by which the bees can be given a purifying flight, without any reference to the external temperature.

If 1 lb. of honey or cane sugar has over twice the sweetening power of a rich the pockets of those who furnish

So improbable and highly discolored as the whole lecture, that many of the etter informed and more thoughtful of the readers of our morning papers were ot slow to believe the Doctor had other detay and proclivities tend more directly towards mercenery motives than they do towards sanitary benefits

> It is unnecessary to assure the intelligent reader, that Prof. Williams' opinions regarding glucose are in accord with those of the most celebrated chemists of Europe and America, and that it is anomalous to find a scientist of any respectability who agrees with Prof. Haines.

> Bee-keepers are thoroughly disgusted with the villainous stuff, and the following will find a ready echo in every honest heart: "I have never used an ounce of glucose, and would quit the business it I had to use it. I have instructed my merchant to give away my honey if any trace of glucose can be found in it."

The following communication bearing upon the use of glucose in the apiary, will be read with interest by the thousands of admirers of its writer. The earnest language employed by the Rev. L. L. Langstroth, its autor, and his forcible manner of presenting facts, cannot fail to carry conviction that the matter has received the fullest consid-

Much has been written in favor of and against the value of grape sugar as a winter bee feed. Some years ago, while not denying that it might be safely used in winter, permitting cleansing flights, I expressed the opinion that it might prove very injurious when the bees were confined for a long time to the hive. I could then speak only theoretically, now I can give the most decided testimony against it from actual observation of its fatal results, in an apiary only a few rods from my house. Mr. David McCord prepared 65 colonies for wintering in the open air. Being both painstaking and skillful, he had never before in wintering lost a single colony. Thirty-six of these colonies colony. Thirty-six of these colonies were fed in the fall upon a syrup made of \(^1\)\square coffee A sugar and \(^2\)\square grape sugar; the others had no grape sugar. Every colony but one which had grape sugar died of dysentery. Two of the others starved, while the rest came through in starved, while the rest came through in better than average condition. His brother, living close to him, wintered 23 colonies in the open air; one starved and the average strength of the others was unusually good. He used no grape sugar in any form. They died with dysentery, between combs well supplied with the mixture above referred to.

Farly in April even after they had

Early in April, even after they had several cleansing flights, the only one of the colonies fed on grape sugar that had survived, was found to be suffering so badly from dysentery that not a bee could fly. An empty hive was warmed by laying it upside down upon a stove; some combs of good honey were also warmed and the bees brushed into the hive from their filthy combs and care hive from their filthy combs and carried into a warm room. Those which Those which could not crawl upon the combs were given a warm bath, and when dried, returned to the others. Although quite weak in numbers they are now in good heart. One night more on their grape sugar combs would probably have killed

This experiment of Mr. McCord's has suggested to me the idea that when bees are suffering from dysentery and no flight can be given them, or they are too weak to fly, a warm bath, even carried so far as to make them insensible, might so relieve them, both externally internally, as to restore them to th. They can easily be warmed health. and dried by contining them to a seive The fearful loss sustained by so many of our best bee-keepers, both in special winter depositories and in the open air, seem to give renewed emphasis to the importance of providing some feasible way by which the bees can be given a

lb. of grape sugar, it is self-evident that to sustain life bees must consume a much larger quantity of the latter than of the former, and that there must be a much greater amount of waste (feces) from the grape sugar. Is it not, therefore, a demonstrable certainty that there is much risk run in using it for winter supplies, where the cold may for winter supplies, where the cold may for 4 or 5 months confine bees to their

In what I have thus far said, I do not assume that grape sugar cannot counter ufactured as pure as that found in the raisin. Mr. Frank R. Cheshire, who is high authority, says, in the London assume that grape sugar cannot be manraisin. Mr. Frank R. Cheshire, who is high authority, says, in the London Journal of Horticulture, April 14, 1881, page 300, that "glucose can be made from old rags, old paper (second-hand pawn tickets having sometimes been employed thus), and indeed any form of cellulose or starch, Indian corn in eellulose or starch, Indian corn in America usually being the source, and by the action of sulphuric acid can be converted into a sugar that no chemistry, no palate can distinguish from that taken from the most dainty bunch of grapes...It is equal to grape sugar, whatever its origin, and as an article of diet it has its value; but all this still leaves its use as an adulterant most disgraceful and all should join bonds. graceful, and all should join hands in fearlessly doing our level best to get the right ticket put upon any man (and his wares) who descends to a practice which, if it does not lower him, wrongs all those who are striving to do honestly. Glucose, although chemically like a portion of honey, is altogether wanting in that which makes hopey. wanting in that which makes honey what it is. Its aroma, the delicate dis-tillment from a thousand flowers inimitable and incommunicable alike, is not there, and he who gives the one for the other is as truly criminal as he who-tenders knowingly a base com."

Mr. A. I. Root, in Gleanings for April, page 203, says: "The American Grape Sugar Co., of Buffalo, N. Y., have at length produced a sugar entirely free from the slight bitter taste which has heretofore characterized even the best recipied grape sugars. It is a pure prorefined grape sugars. It is a pure product of Indian corn, and is as pure and simple a sweet as the best grades of maple sugar."

Now, the expert chemist may perbaps make a perfectly pure article of grape sugar, but this is a very different thing from his being able to manufacture the same on a large scale, and for commercial purposes, so that it can be profitably sold for its real sweetning value. Our friend Root, in his honest enthusiasm, says: "Just taste of it yourself (the Buffalo article) if you are incredulous. We will mail you a sample for 5 cents, which I think will settle ple for 5 cents, which I think will settle the discussion. We have tasted it, and the discussion. yet are not convinced. A very nice article it is as compared with that made a few years ago, but, if our taste is not at fault, the bitterness is not yet wholly eliminated. We have tested it side by eliminated. We have tested it side by side with a pure article of maple sugar, and we should never think of comparing the delicate taste of the latter to the mockish taste of the former. We are far from setting up our own taste as an infallible criterion, and we therefore eall upon Prof. Kedzie, or other analytical chemists, to take hold of the matter and give us the bottom facts, without fear or favor.

Suppose that their verdict is that the Buffalo article is a perfectly pure grape sugar—what then? Considering its low sweetening power, at present prices can there be any advantage in using it as a bee-feed which will justify the risks to which I have referred? Are not both grape sugar and glucose, at ent, used on so enormous a scale, almost entirely for adulterating the commercial sweets? Is it not a fact sworn to by one of the former proprietors of the Buffalo Co., that on a capital of \$400,-000 they realized in one year a profit of \$1,000,000? Did not this profit come by 51,000,000? Did not this profit come by furnishing to unscrupulous men the facilities for adulterating the sweets in common use by the people? Tweed-like, the reply to such questions may be for a little longer, "what are you going to do about it?"—but we hope only for a little longer.

no equivalent for the money they reno equivalent for the money they receive, even if they do not sell an unwholesome article in their adulterated mixtures? The American peeple may be somewhat slow in reaching results, but how often have we found that they effectually reach them at last? Let laws be made compelling those who manufacture grape sugar and glucose to sell their products for what they are, and forbidding the use of them in adultant to sell their products for what they are, and forbidding the use of them in adulterating our commercial sweets, and how long will it be possible for manufacturers or dealers to make such exorbitant profits out of a deluded public? Then if their products are wholesome and have a substantial value prices will find their proper level, and the new sweets may be of benefit to the public.

L. L. Langstroth.
Oxford, O., April, 1881.

Oleomargarine and lard-butter are rapidly working their own destruction. While the best medical authorities are attributing the rapid increase of Bright's disease, diabetes, and other complaints incident to the urinary organs to the excessive use of glucose, bogus butter is now charged with giving rise to indigestion, cramps, "winter cholera," and even trichinæ. The recent legislative investigation in New York has brought to light some interesting statistics, and verified a prediction we made several months ago, that while it was not only a fraud perpetrated upon the unconscious consumer, it was an injustice to manufacturers of genuine butter and cheese, and would bring their goods into disrepute. We collate the following from the reports of the investigation:

The direct injury to the dairy interests of the country was put at \$50,000,000 to \$75,000,000 per year. Francis D. Moulton showed that last year 25,000,000,000 per year. on the showed that last year 25,000,000 lbs. of oleomargarine and 28,000,000 lbs. of butter were exported from the United States. The committee visited the oleo-grease-butter factories without varning, and found them dirty and offensive. Consumption is being greatly curtailed by the fear of oleomargarine and lard butter, and the trade in good butter is much injured.

C. A. Butler testified that some manufacturers made eleomargarine from the fat of offensive meat, and extracted it at a temperature of 150°, which was nearly 100° below the temperature necessary to destroy animal life in fat. He had little faith in the legislative measures to prevent the sale of an adulterated article for genuine butter, but thought a small license fee and a penalty of \$\$400 for each offense might do some. ufacturers made oleomargarine from \$500 for each offense might do something toward suppressing the adultera-tions. He would compel greers who dealt in bogus articles to display the "Adulterated butter and cheese sign, "Ad sold here.

Walter Carr testified that an immense amount of lardine or lard butter was disposed of in the New York markets. Not one-hundreth per cent. of the bo-gus articles manufactured is sold for what it is, and grocers sell it at an enormous profit for the reason that if they took only a fair profit, customers would suspect the character of the article sold them for butter. Customers, if they knew what they were getting, would

not buy it.

H. K. Thurber, of the firm of H. K. & F. B. Thurber & Co., testified that tubs of oleomargarine weekly. Last year he exported nearly one-half of his manufacture, but this year only 7 per cent. He branded all his goods as required by law, but was aware that some retail dealers removed this mark when etail dealers removed this mark when they had the oleomargarine in their

Of course, there are some persons who do not hesitate to declare that oleomargarine and lardine are as wholesome and desirable as good butter, and preferable to poor butter; yet they acknowledge that it is sold, if at all, under any name but the right one. The fact that losses of bees during the past winter by glucose and grease-butter have to be those present amount to 55 per cent.

sold under fictitious names, is argument conclusive that they should be retailed under their right names; the same is applicable to all food and medicinal adulterations. If a customer asks a grocer for sugar or honey, he should have it, and not a decoction of sulphuric acid and corn-juice; if he buys butter he should have it, and not wagon-grease at butter prices.

Viewed from a moral standpoint, the whole system of food adulterations and their imposition upon the public is wrong, radically wrong. But if chemical and medical testimony is entitled to any weight, then the moral wrong is transformed into a serious crime. Instead of feeding our families with wholesome, nutritious food, we are daily administering insidious poisons which, though not merciful enough to cause speedy death, is quite as certain in accomplishing final destruction. What does it matter whether days, months or years be consumed, if under the guise of legitimate food a nation or race of people may become contaminated, their duration of life shortened, temporary ailments become chronic, and activity and intelligence degenerate into effeminacy and imbecility, does it relieve the government of its duty in the matter? Is it not imperative upon Congress to protect the people from national calamities? Can Congress ignore the universal demand for protection from imposition, when it has been convincingly demonstrated, time and again, that as a sanitary measure it is absolutely necessary? State Legislatures have nobly attempted a partial reformation, and have ignobly failed. Food adulteration is a National evil, and nothing short of a National law can regulate it. If any imitation is equal in point of excellence to the genuine article, then its manufacturer or retailer need not fear honest competition under its proper name: but if it is inferior, then the genuine article should be protected in its superiority, and the purchaser be protected against imposition.

Correction.—On page 139, in Mr. Boardman's article, 15th line from the top, the word pushed should be perished; 36th line, the word feeding should be fussing. These errors occurred through the oversight of the printer.

We attended the Central Michigan Convention on the 5th. inst. There were about 100 members present—some 8 or 10 being ladies. The Rev. J. W. Ashworth presided and Mr. Geo. L. Perry was secretary, and both were reelected for the coming year. Mr. Perry worked faithfully to get up a good meeting, and must have been flattered at his success in that direction. We enjoyed a short but very pleasant visit with Prof. A. J. Cook, well known throughout the apicultural world as a scientific and thorough bee-master. A report of this Convention may be expected in our next issue. The Chicago Times of Friday had the following special telegram :

Lansing, Mich., May 5.—The Central Michigan Bee-Keepers' association was in session here to-day. Mr. T. G. Newman, editor of the Bee' Journal, of Chicago, delivered an excellent address, which caused much enthusiasm. Prof. A. J. Cook, of the Agricultural College, reviewed the subject of wintering bees and the causes of disaster. The

#### LONDON JOURNAL OF HORT.

Apis Dorsata,-Mr. Alfred Neighbour has translated from the Bienen-Zeitung. a letter from Hern C. J. H. Gravenhorst, on the introduction into Germany of this large bee of Java. Mr. Gravenhorst quotes from a letter received from Mr. Benton concerning his visit to Java to obtain these bees, and also says that he is in correspondence with Dr. Grabowsky, a young savant of Prussia. who is going to Borneo to collect insects, plants, etc. The editors of the Beinen-Zietung append the following comments, which will be read with interest:

Mr. Vogel received some very special information about this species of bees direct from India a few years ago, and in his opinion the introduction of the species (not race) would be of great scientific interest, as its hybrid offspring especially would afford bee-keppers especially would afford bee-keepers some very valuable information. To acclimatize this bee in Germany will be impossible, as coming from the tropics it will not be able to live through our northern winter. This was our experience with Apis fasciata, which dies in the hive when the temperature of the air outside shows from 3° to 5° R. frost, though the walls of the hive may be thick and warm. Nevertheless, in the interest of science we recommend the importation of Apis dorsata, and Mr. Vogel will announce in due course how o make it safely and without difficulty live through the winter.

There can be no question of any practical importance attending the introduction of Apis dorsata into Germany, but it might be possible to acclimatize it in the Southern States of the United States of North America.

#### GLEANINGS.

😭 Mr. C. E. Glazier says: "He has lost 70 out of 88 colonies with prospect of losing still more-50" spring dwindled."

Novice says: "I think you are right, friend N., in deciding that good cellars are almost the only sure winter repository in a winter like the past."

Mr. J. H. Townley, the original chaff-hive man, is disgusted with them, and offers to sell his "38 chaff-packed wintering hives at a price much below their actual cost."

Mr. James Heddon says: "Out of 212 colonies, nearly 1/2 are dead and worthless; about 1/2 were packed with chaff, and ½ with sawdust, and shavings above. The loss is greater among those packed in chaff, though they being in another apiary, it is no test of packing shat we can be sure of."

Save the Empty Combs.-"Do not let your empty combs go to waste. If they are nice ones, do not try them up for wax, either. Look at them often, fumigate them if the worms get started on them, and save them for another year, if you do not need them all this. I have often saved them over, without a particle of injury."

Langstroth Frames for Wintering.—
Mr. H. B. Harrington says: "Facts
will show that bees in hives with deep
frames...have died just as badly, if
not worse, than those in the usual hives
(Langstroth traines). Out of 37 hives
of bees....17 in the "American" hives
and 20 in Langstroth—all died in the
American hives but 2, and there were
10 in the Langstroth hives that lived."

"Novice's" Report.—The following is taken from the department of "Blasted Hopes," in Gleanings for May:

Started into winter quarters with about 140 stocks, in chaff hives, well protected, but pretty weak in bees.—During the winter and spring, the queens were sold out of perhaps 20 of them, and the bees were put with others. To-day, April 22, I have 12 hives with bees in them. Three of the 12 are gathering pollen fairly, but the other 9 will pull through, only with the other 9 will pull through, only with the very best kind of weather and care. The cause of the loss, so far as I can tell, is, first, too few bees; second. that the combs were handled and mixed during the process of uniting afformation. the combs were handled and mixed during the process of uniting after queen-rearing, so that the bees had no chance to build and wax up in old tough combs before the approach of cold weather, as they usually do; third, the long winter, which gave them no good opportunity to fly, for a period of nearly 6 months. I am not quite sure in my convictions, from the fact that, others, lost, heavily. from the fact that others lost heavily, who complied, so far as I can tell, with the first of the above conditions, and also that some wintered well whose bees were in as bad shape, or nearly so, as mine. Another thing, I do not know why those three fair colonies came out better than almost a hundred others. The above report is for myself,
A. I. Root, Editor of Gleanings.

Mr. G. M. Doolittle says: "If

this weather keeps up long I shall lose half of my bees that were wintered on the summer stands, packed in chaff. Those in cellars are doing much better."

#### MISCELLANEOUS.

By the Eichstadtsche Beinenzietung we learn that a committee has established itself to erect a monument to the honor of the Baron von Berlepsch, who has done a great deal toward the ad-vancement of modern bee-culture. The vancement of modern bee-culture. The monument of marble and metal will cost about \$300, and will be erected in Erfurt, the capital of the Baron's native country. The petition closes with these words: "Honor yourselves, by honoring this great dead."

Timely Hints.-Mrs. L. Harrison, in the Prairie Farmer, gives the following timely hints to novices in bee-culture:

The last half of April was very favorable for bees. It was astonishing how much pollen was carried in during warm, moist days. As there are but few bees in this locality, besides our own, we feed them diluted honey in the open air, and we never saw them build up faster at this time of the year. The shade trees of the city, such as cotton-wood, box elder, soft and silver-leafed maples, hummed with the music of busy workers.

As soon as a colony becomes populous, it would be better to remove frames of hatching brood, and give them to weaker colonies than to put on surplus boxes. Frames containing worker comb should be put in place of removed brood, and some apiarists claim that it is best not to separate brood combs, but to place these empty frames at the side instead of the centre of the brood nest. Bow keeping is a knowledge of nest. Bee-keeping is a knowledge of small items, and good judgment must be exercised in the practice of it. Thus in building up weak colonies at the expense of the strong, if we are not very careful we will soon have the best ones in the same condition that the careful we will soon have the best ones in the same condition that the poor ones were formerly; but if hatching brood is taken away no faster than the strong one can bear, and the colony is stimulated with feed, the apiary will be henefitted by the exchange. A good way to feed during stormy weather is to uncap frames of sealed honey and put it in the place of empty comb.

During seed time remember the winged stock, and put in a tid-bit for them. Sweet clover, migonette, borage, mustard, etc., will bring quick returns, and when setting out trees do not forget the linden.

Dathe, a noted German apiarist, has recently died.

Taking Off Top Cushions.—When is the time to take off top cushions? I have not seen anything about taking off, but enough about putting them on. Mine are on yet. I lost 4 colonies in wintering—2 in frame and 2 in box hives. I believe in top ventilation; without it, I believe I should have lost all my bees. I will give an old Virginian's method of trapping moths: Put an iron kettle in your bee-yard, in the midst of the bees, till half full with soapsuds, drive a stake solid in the ground near the kettle, nail an arm to it so as to extend over the kettle, then hang a glass lantern in the kettle so it will reach within 2 inches of the water. Light the lantern at dusk; the light attracts them, and they soon rug over it in the day time. J. N. B.
Linn Grove, Ind., April 22, 1881.

[Leave top cushions on till the nights become so warm as not to chill the brood. then replace with a blanket or honeyboard till time to let the bees up in the second story.—ED.]

Loss 90 Per Cent.—In this region we have suffered the loss of nearly all our bees during the past winter. I think that 90 per cent. of the whole quantity is dead. I know of none who had better success than I, and my loss was 5-12. Well, we are not disconraged; our survivers are working finely, and in every way are making a good start. I congratulate you on the success of the Weekly JOURNAL. W. B. SPENCE. Sidney, O., April 30, 1881.

Wintered Without Loss.—I put 30 colonies of bees in the cellar Nov. 10, and took them out April 23; they all came out alike strong with bees and had plenty of honey. They are at work now on the willow and popple. The loss in wintering has been very heavy in this vicinity. It was a poor honey season last year in general. From 25 colonies I took 1,000 lbs of comb honey and had 5 swarms. The Bee Journal comes every Friday; that is not too often. Mr. G. M. Doolittle's articles in the Journal were worth more than \$50 to me last season. As long as I keep bees I shall take the Bee Journal.

CLARENCE MARSH.

Sharon, Vt., April 25, ISS1.

The Italian Bee not a Pure Species.

-Mr. Demaree, upon this question, furnishes the readers with some very important considerations regarding the purity of the Italian bee, which he pro-nounces a hybrid, or a cross between a nounces a hybrid or a cross between a pure "yellow, quiet race, and a fierce, black, irritable race of bees," and he thinks it impossible that the race is pure. He is tempted to ask what is meant by the dark and light strains of Italians, and what point is the dividing line to be fixed. The dividing line, I supposed, had already been fixed, or so near that it was very satisfactory to all. or nearly so. As to color—i.e., light and dark—it is of but little consequence, if the makings be true and uniform which dark—it is of but little consequence, if the markings be true and uniform, which cannot be found in a hybrid of any kind. When the Italian bee is crossed with the black in this country, there is no uni-formity of color about them. Does the same rule work in Italy as here? Cer-tainly it does. It must be a settled fact, if they are a cross between the pure yellow and the pure black that Mr. Dem-aree speaks of, have they not been bred long enough to become a fixed type? aree speaks of, have they not been bred long enough to become a fixed type? Most assuredly they have. At least this is my experience with them 18 years. From the first I claimed they varied in shades of color as much as does the Anglo-Saxon race, but with uniform markings of the three golden bands; that is, the entire colony.

It seems that the writer had a starting point as he speaks of a "nurr vellow"

point, as he speaks of a "pure yellow race" and a "pure black race." If there race "and a "pure black race." If there did exist a pure yellow race as he speaks of, is it possible that race is entirely extinct. As to the color of the beautiful Italian bee being altogether produced

by a careful selection of our own, is a gross mistake. There may be cases where this to a certain extent is true. I have seen the brightest and most beau-I have seen the brightest and most beautifully colored bees bred from one of the darkest queens I eversaw. This is quite common with many of the dark imported and home-bred queens, but the progeny of those queens did not show any signs of the black bee, even if they were several years old. As regards the different shades of color being evidence of their impurity, where they breed uniform, it is all bosh.

The month of March afforded but little food for the bees. In the peach, plum and many other flowers, the honey and pollen were mostly destroyed. Strong colonies bred heavily through March; some with little honey had much brood; the 25th of March we had a cold freeze which destroyed nearly all the peaches and killed large quantities of brood; the cold caused the bees to recede to the the cold caused the bees to recede to the center of the hive to keep warm, leaving the young larvæ to freeze. This happened only in weak colonies, as the strong ones had plenty of bees to keep warm. On the 5th of April they commenced to swarm, which they have kept up quite busily. They are gathering honey rapidly at the present time, and the prospect is rather encouraging. The past season was one of the poorest The past season was one of the poorest known for many years, and caused some to retire from the field in disgust.

The past winter was a severe one on

all colonies with but little honey. Strong colonies came through splendidly, and up to the present time some have gathered perhaps 20 lbs. or more. All the bees that have died are such as were destitute. White clover is now blooming and nonrector flowers. ing, and many other flowers, giving the bees plenty to do.

A. F. MOON.

Rome, Ga., April 23, 1881.

Prevention of Swarming.—I was delighted to see the change from Monthly to Weekly, and wish it every success. I have increased by natural swarms, since March 31st, from 13 to 35 colonies, and they were all very large ones at that. The bees are now in a feast of white clover bloom, and storing honey rapidly. I am now cutting out all drone comb lam now cutting out an around and destroying queen cells, to try and prevent them from swarming. Am I pursuing the right course? If there is any better plan, please report it in your valuable JOURNAL.

W. R. THOMSON.

New Iberia, La., April 29, 1881.

[If you have the time to spare to go through your hives once a week and destroy queen-cells and drone comb it may do; but we would advise that you clip one wing of each queen. With a small pair of scissors or a sharp knife, cut off about 1/2 or 2/3 of the wing. The operation is quickly performed.-Ed.]

More Homer .-

More Homer.—

The Weekly Bee Journal,
Long may it wave,
O'er the home of the bee
And the laud of no slave;
Good-bye fogy notions,
Humbugs and queer ways,
Such as "king bees," "gums,"
And brimstone's blue rays (blazes).
Jacksonville, Ill., April 21, 1881.

H. T. C.

Very Refreshing.—1 commenced this spring with 132 colonies, have increased to 146, and have already extracted 626 gallons of honey. Counting the original number, it makes an average of 56.8 lbs. per colony. The white clover season closed on April 29. The next (which is the same as your basswood harvest), commences the first week in June and continues until the last of July. If the season is as good as it was in 1879 I shall get about 700 gallons more. My average that year was 9 gallons per colony, counting the number commenced with in the spring. I have never used an omnce of glucose and would quit the business if I had to use it. I have instructed my merchants to give away my honey if any trace of glucose can be found in it.

Franklin, La., May 1, 1881. Very Refreshing.-I commenced this

Franklin, La., May 1, 1881.

Heavy Loss.—I have lost 28 out of 31 colonies of bees during the past winter.

WM. A. BRUNDAGE.

Lodi, N. Y., May 2, 1881.

Loss 50 Per Cent.—I had 14 colonies of bees packed in chaff on the summer stands. I have lost 7; the other 7 are strong. Nearly all the bees in this vicinity are dead. Success to the Jour-NAL. V. Fisher. . Fisher.

Ironton, Wis., April 30, 1881.

Spring Dwindling.—I must sorrowfully disclaim, as undeserved, the credit given my sister and myself for comparative success in wintering, in the BEE JOURNAL for April 27. On March 9, after a 3 days' flights our bees received a thorough examination. Bottom boards were cleaned and honey given where needed. Those which had suffered more or less from dysentery—some 25 colonies—were found in much better condition than had been anticipated. They had considerable capped brood and no lack of bees to care for it. Brood enough had been reared to in part supply the place of bees which had Spring Dwindling .- I must sorrow part supply the place of bees which had died. But little honey was left in many cases, but this we could remedy. We found but 2 dead colonies—one from starvation. At that time we expected to lose no more. In answer to inquiries, about 10 days later, we reported as above, hence the statement in the Saginaw Herald. Some of our friends will not be greatly surprised to learn that our amended report is a loss of 15 out of 52. We close our 9th year as beekeepers with our 1st experience in spring dwindling; we have never before lost a colony in wintering. We attribute a large part of our loss to the fact that we were unable to prepare our bees in good season last fall. We winter in chaff on the summer stands, and our theory is that the best results may starvation. At that time we expected our theory is that the best results may be looked for only when the bees are packed early enough to insure their flying out after the packing.

LUCY A. WILKINS.

Farwell, Mich., May 3, 1881.

Bees Doing Well Now .- My bees are doing well now; some colonies are so strong that they hang out even during some cold nights. I have bought some and commence with 120 colonies, after 

Bangor, Mich., May 6, 1881.

Building Up.—My bees are doing splendidly. My Italians are rearing drones already. I have only 8 colonies and I want to turn them all to increase, and shall raise no surplus until I get as many colonies as I think I can manage. many colonies as I think I can manage. I do not know exactly what plan to adopt. I have plenty of foundation; bought a lot of comb built out, from parties that lost their bees last winter. I look over my colonies every day and give my queens empty frames as fast as they need them. I shall first build each colony up strong, before attempting any increase, then insert a division board in my best colony, separate the queen and part of the bees from one side of the hive, and then raise a lot of queen cells (or remove the queen en queen cells (or remove the queen enirely and introduce her into a nucleus). then form as many nuclei as I have queen cells. This is the best plan that I know of. W. T. CLARY. Claryville, Ky., April 18, 1881.

Packed in Chaff, Without Loss,—1 put in winter quarters 33 colonies (27 in the Doolittle hive, the rest my own make). I put cotton cloth over at each side; packed the super and ends of hive with straw and chaff; put them in a row; drove stakes about 6 inches in front and drove stakes about 6 inches in front and 6 inches back of the hives; placed boards inside the stakes and filled in with buckwheat chaff, and from 6 to 10 inches of wheat chaff above, covered with boards to keep dry; laid a board in front, supported by ½ inch blocks laid on the alighting-board, to keep the chaff from the entrance and give a chance for flight, which they did not get from about the middle of November. chance for light, which they did not get from about the middle of November, when I packed them, until in March. I fed them coffee A and granulated sugar in the fall, to last until March, and the winter held on so long that I did not open them until about the middle of April, when I found two starved, (my only loss); these two were dry and in

By the bee papers I learn of heavy losses among the unfortunates being G. M. Doolittle (my guide). I sold 24 colonies, 23 of which are now silent: the one living was left with me, and I packed the super with chaff and left it out. They are carrying in pollen to-day. Mr. Doolittle says in forming nuclei he would wait 24 hours before introducing the cell, and would keep them shut up until towards night of the second day, to keep towards night of the second day, to keep them from gom; back home. Now, how would he introduce the cell without the bees getting out? or would he smoke them down from the top, and put the cell on the frames instead of grafting it in? I learn of soveral having from? in? I learn of several having from 8 to 20 colonies in box hives, all of them dead; one apiary, 9 miles from me, of 160 colonies in the fall, in Langstroth frames, 100 dead; another of 30 colonies, in Langstroth frames, 18 dead 1 month ago, and expected to lose more. I am well pleased with the Weekly BEE JOURNAL; success to it.

A. P. Cowan. Grattan, Mich., April 24, 1881.

[Desiring Mr. Doolittle to answer the above query, we have obtained the following reply from him.—ED.

"I said 24 hours' waiting, in opposition to A. I. Root's theory, to introduce queen-cell on taking queen out, which has failed 19 times in 20 with me. In this case the nucleus already had a laying queen to be replaced with a cell. When we make nuclei by the plan Mr. Cowan speaks of, we do not introduce queen-cell till after they have flown, queen-cen till after they have nown, unless the nucleus is made from queen-less colony, as 1 prefer; in that case they are made 48 bours before the cell is ready to hatch."—G. M. D.]

Encouraged.—I fed some in the fall, but the cold weather set in so early that it proved a failure. All colonies that had stores enough are now in good condition and full of bees.

ROBERT CORBETT.

Manhattan, Kan., May 3, 1881.

Bee-Keeping in Dakota.—Now that winter has passed and the floods have subsided, I will venture to give an account of bees and bee-keepers in Dakota. Twenty bee-keepers within my knowledge, who, last fall, owned over 800 colonies of bees, do not now own over Is0 colonies. Seven of them lost all they had; and of these 7 the most of them were the largest bee-keepers here, 3 of whom live in Vermillion, Dakota. 3 of whom live in Vermillion, Dakota. The loss from wintering I think will not exceed 20 per cent., the great loss was from the floods that have not only swept away bee hives, but in many places on the Missouri River bottom it has swept away houses, barns, etc., and also several towns and villages were alalso several towns and villages were almost entirely swept away, causing privation and suffering to a considerable extent. My bees went through the winter first-rate; I only lost 2 colonies; they are doing well now, and have their hives well filled with brood, and if the present good weather continues they will swarm as early as usual, notwithstanding the late spring.

W. M. VINSON.
Elk Point, Dakota, May 2, 1881.

Loss 80 Per Cent. in Cellar.—I put 109 colonies of bees in the cellar last fall, and have but 28 healthy ones now. They did not have honey enough for such a long winter. R. S. Johnson.
Lockport, Ill., May 3, 1881.

Loss One-Third .- The past few days have been fine for bees, and they have improved the time gathering pollen from the willows and soft maples. We had snow 4 inches deep on the 13th inst. had snow 4 inches deep on the 13th inst. The loss in wintering in general is very heavy in this locality, especially where they were left on the summer stands. My loss is about 33 per cent.; all wintered in house and cellar. The loss is mainly of those wintered in cellar, which was damp, and too cold.

W. D. WRIGHT.
Knowersville, N. Y., April 28, 1881.

Our Letter Drawer is yet very full, and many will be disappointed in splendid condition. My bees have been bringing in pollen for the last 3 days. not seeing their letters in this Journal.

#### SPECIAL NOTICES.

Single copies of the Journal are sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

The Volume of the BEE Jour-NAL for 1880, bound in stiff paper covers, will be sent by mail, for \$1.50.

When changing a postoffice address, mention the old address as well as the new one.

We have prepared Ribbon Badges for bee-keepers, on which are printed a large bee in gold. Price 10 cents each, or \$8.00 per hundred.

Notices and advertisements intended for the Weekly BEE JOURNAL must reach this office by Friday of the week previous.

We can supply but a few more of the back numbers to new subscribers. If any want them, they must be sent for

A Safe and Sure Means of restoring the youthful color of the hair is furnished by Parker's Hair Balsam, which is deservedly popular from its superior cleanliness.

Constitutions and By-Laws for local Associations \$2 per 100. The name of the Association printed in the blanks for 50 cents extra.

Sample copies of the Weekly BEE JOURNAL will be sent free to any names that may be sent in. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office. names to this office.

The date following the name on The date following the name on the wrapper label of this paper indicates the time to which you have paid. In making remittances, always send by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, and local checks, are not taken by the banks in this city except a discount of \$55, to have evenes of at a discount of 25c., to pay expense of collecting them,

Premiums.—For a club of 2, weekly we will give a copy of "Bee-Culture;" for a club of 5, weekly, we will give a copy of "Cook's Manual," bound in cloth; for a club of 6, we give a copy of the Journal for a year free. Do not forget that it will pay to devote a few hours to the Bee Journal.

At the Chicago meeting of the National Society we were requested to get photographs of the leading apiarists, to photographs of the leading apiarists, to sell to those who wanted them. We can now supply the following at 25 cents each: Dzierzon, the Baron of Berlepsch, and Langstroth. The likeness of Mr.Langstroth we have copied, is one furnished by his daughter, who says, "it is the only one ever taken when he was in good health and spirits." We are glad to be able to secure one of such a satisfactory pature. a satisfactory nature.

\* It would save us much trouble, if all would save us much trouble, if all would be particular to give their P.O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name. Many others having no Postoffice, County or State. Also, it you live near one postoffice and get your main at another, be sure to give the address we have on our list. dress we have on our list.

Food for the Brain and Nerves that will Food for the Brain and Nerves that win invigorate the body without intoxicating, is what we need in these days of rush and worry. Parker's Ginger Tonic restores the vital energies, soothes the nerves and brings good health quicker than anything you can use.—Tribune. See other column.

#### ELECTRICITY IS LIFE.

#### FOR MEDICAL PURPOSES.

Or, Bryan's Perfected Electro-Voltaic and Magnetic Appliances surpass all other methods of treat-ment, for their wonderful recuperative power in cases arising from

Loss of Nervous or Vital Energy, Harrass of Business, Excessive Mental Application, Malarious Poisoning or Acts of Imprudence,

causing Physical Weakness and Nervous Prostration, Nervous Debility, Seminal Weakness, Impotency, Brain Troubles, Epilepsy, Paralysis, Spinal Disordera, Dyspepsia, Heart Troubles, Kidoey Diseases, and other functional derangements.

#### Medicine Fails to Cure these Diseases,

Electricity properly applied, with continuous current night and day to the hody, will cure them. IT IS NATURE'S REMEDY. It gives force to the brain, digestive functions and circulatory forces, and renews the vital action so necessary to recovery.

Dr. Bryan's ioveotion is patented, and has proved itself invaluable in many thousand cases.

#### Beware of Frauds-this is the Only Cenuine.

Reader, if you are a sufferer it will do you no harm to send a statement of your case to us, and you will be advised by our Medical Electrician in relation to it. Enclose postage, and prompt attention will be given. Address, ELECTRO APPLIANCE COMPANY, Limited, Bond Street, near Broadway, New York.

#### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

CHICAGO.

HONEY-The market is plentifully supplied with honey, and sales are slow at weak, easy prices. Quotable at 154 let 1.05 let of common dark-colored and 12 b.boxes; at 146 12c. for common dark-colored and broken lots. Extracted, 7560 140c.

BEESWAX.—Choice yellow, 206 23c; dark, 15617.

#### NEW YORK.

In order to have this Table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

We are very sorry to hear that both Mr. and Mrs. Doolittle are ill; Mrs. D. was thrown from a sleigh and received severe injuries, several weeks ago.

The Southern Michigan Bee-Keepers' Association will hold a meeting in Battle Creek, Mich., on Wednesday, May 11, 1881, at 10 a. m.

B. Salisbury, Sec.

The N. W. Wisconsin Bee-Keepers' Convention will be held at LaCrosse, Wis., in Germania Hall, Tuesday, May 11, 1881. Several essays will be readone on "Wintering Bees," by N. Lossing, of Hokah, Minn., and one by L. H. Pammel, on the "Progress of Bee-Keeping." As a question box will be opened, it will consume a great deal of time to discuss the different topics. The custom of reading many essays will be custom of reading many essays will be done away with at this Convention, since it will be of more interest to discuss live issues than listen to essays.

L. H. Pammel, Jr., Sec.

The Annual Meeting of the Society for the promotion of Agricultural Science will be at Cincinnati, on Tuesday, Aug. 16, 1881, the day preceding the sessions of the American Association for the Promotion of Agricultural Science and Promotion of Agr

## Books for Bee-Keepers.

Sent by mail, postpaid, on receipt of price, by THOMAS C. NEWMAN.
974 West Madlson Street, CHICAGO, 1LL.

Cook's Manual of the Aphary.—Entirely rewritten, greatly enlarged and elegantly illustrated, and is fully up with the times on every conceivable subject that interests the apharist. It is not only instructive, but intensely interesting and theroughly practical. The book is a musterly production, and one that no boc-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper, \$1.

Quinby's New Hee-Keeping, by L. C. Root.— The nutlior has treated the subject of bee-keeping in a manner that cannot fail to interest alf. His stylo is plain and forcible, making all its readers sensible that the author is master of the subject.—81.50.

is plain and forcible, making all its readers acression that the author is master of the subject... \$1.50.

Navice's. A B C of Bee-Culture, by A. I. Root. This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25; paper, \$1.09.

King's Hee-Keepers' Text-Hook, by A. J. Kum...—This edition is revised and brought down to the present time. Cloth, \$1.00; paper, 75c.

Langstroth on the Hive and Honey Hee This is a standard scientific work. Price, \$2.00.

Bleased Hees, by John Allen...—A romance of bee-keeping, full of practical information and contagious enthusiasm. Cloth, \$1.00.

Bee-Culture; or Successful Management of the Aplary, by Thomas G. Newman...This pamphlet embraces the following subjects: The Location of the Aplary. Honey Plants—Queen Rearing —Feeding.—Swarming —Five for either edition, 40 cents, postpaid, or \$3.00 per dozen.

Food Adulterntion; What we can and should not eat. This book should be in every family, where it ought to create a sentiment against the adultration of food products, and demand a law to protect consumers against the many health-destroying adulterations offered as food. 200 pages. Paper, 50c.

The Dzierzon Theory;—presents the fundamental principles of bee-culture, and furnishes a

consumers against the many health-destroying adulterations offered as food. 200 pages. Paper, 50c.

The Dzierzon Theory;—presents the fundamental principles of bee-culture, and furnishes a condensed statement of the facts and arguments by which they are demonstrated. Price, 15 cents.

Honey, as Food and Medleine, by Thomas G. Newmao.—This is a pamphlet of 24 pages, discoursing apon the Ancient history of Bees and Honey; the nature, quality, sources, and preparation of Honey for the Market; Honey as an article of food, giving recipes for making Honey Cakes, Cookies, Puddings, Foam, Wines, &c.; and Honey as Medicine, followed by many useful Becipes. It is intended for consumers, and should be acattered by thousands all over the country, and thus assist in creating a demand for honey. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Bees.—This pamphlet contains all the Prize Essays on this important subject, that were read before the Centennial Bee Keepers' Association. The Prize-425 in gold—was awarded to Prof. Cook's Essay, which is give on full. Price, 10c.

The Hive I Use—Being a description of the bive mather of the content of the prize of the content of the prize of the content of the prize of the prof.

The Hive I Use-Being a description of the bive used by G. M. Daolittle. Price, 5c.

Extracted Honey; Harvesting, Handling and Murketing.—A 24-page pamphlet, by Ch. & C.P. Dadani, Hamilton, Ill. This gives in detail the methods and management adopted in their apiary. It contains many useful hints.—Price 15c.

It contains many useful bints.—Price 15c.

Practical Illust to Ree-Keepers, by Chus. F. Mult; 32 pages. It gives Mr. Mult's views on the management of bees, Price, 10c.

Kendall's Illorse Book.—No book can be more useful to borse owners. It has 35 engruvings, Illustrating positions of sick hoses, and treats all diseases in a plain and comprehensive manner. It has a large number of good recipes, a table of doses, and much other valuable horse information. Paper, 25c.

Chalden Chalorse has A 14 lill.—A tension on its

Chleken Cholera, by A. J. Hill,—A treatise on its cause, symptoms and cure. Price, 25c.

Ropp's Easy Calculator.—These are handy tables for all kinds of merchandise and loterest. It is really a hibtioing calculator, olicely bound, with state and pocket for papera. In cloth, \$1.00: Moroco, \$1.50. Cheap edition, without slate, 50e.

Crowning Culmination | A \$5 Book for \$2,5011

ciety for the promotion of Agricultural Science will be at Cincinnati, on Tuesday, Aug. 16, 1881, the day preceding the sessions of the American Association for the advancement of science.

The bee-keepers of Missouri will meet in Convention at Mexico, Mo., on June 2, 1881, at 10 a. m., and hold a session two days. Dr. N. P. Allen, of Smith's Grove, Ky., President of the North American Bee-Keepers' Association, is expected to be present to assist in organizing a Bee-Keepers' Association; other leading bee-men are expected, due notice of which will be given. The programme will be published in a short time and will embrace such questions as will be of interest both to the novice and practical apiarist. All are invited to partake of and assist in this much needed organization. Those that cannot come willconfer a favor by giving us a communication on some subject of interest to beemen. P. P. COLLIER, Viee Pres. N. A. B. K. Association, for Mo. All papers of Missouri please copy.

The next meeting of the N. W. Illinois and S. W. Wisconsin Bee-Keepers' Association, will be held at H. W. Lee's, 2 miles n.w., of Pecatonica, Winnebago county. Ills., on the 17th of May, 1881.

Programme of the Northwestern Bee-Keepers' Union, to be held at Hastings, Minn., May 17, 1881:

1.—Address of Welcome, by J. N. Searis.
2.—Reports of committees.
3.—Reports from all—aumber, kind and condition from

of bees.

4.—A paper by Pres. A. Tildball, on honey-producting plants and flowers.

5.—A paper by Dr. P. Barton, of St. Panl, on honey as food and medicine.

6.—Apiary culture and our fairs, by Hon. William Avery, of St. Croix Fails, Wis.

7.—A paper on sales of honey, by F. B. Dorotby, of Taylor's Fails, Minn.

8.—A paper on wintering bees, by L. Day, of Farmington.

ington.

5.—Proxressive bee-culture, by J. G. Teter.
The above subjects will be open for discussion. It addition to the above, the following subjects are suggested:

Rested:

1.—Essential properties of a good bee hive.

2.—How to prevent and enre foul brood.

3.—How to prevent spring dwindling.

4.—Comb Foundation, with dividing and natural swarming.

Appointment of committees.

Election of officers. Adjournment.

77 All bee-keepers are cordially invited. Entertainment free.

Translated for the American Bee Journal,

#### The Apiary of Mons. Fiorini.

CHAS. DADANT.

By request of the editor of the Bee Journal I translate the following very interesting editorial article from L'Api-

"Who has not heard of Fiorini, the enterprising bee-keeper who last year made a trip to the Orient expressly to secure the direct importation of the far-famed bee from Cyprus Island. As soon as he had returned from his improve in Lampary 1880 he informed journey, in January, 1880, he informed me of the successful issue of his underme of the successful issue of his undertaking, and invited me to come and see the colonies he had brought with him. I hastened to Monselice, a town on the road between Padua and Bologna, where Mr. Fiorini resides. At Padua I met Mr. Sartori, who, returning from Venice was on his way to Monselice. Major Hrushka, the inventor of the honey extractor, was to be one of the party, but, to our sorrow, at the hour of starting Mr. Sartori had to depart alone. From Padua one hour by railroad brought us to Monselice, where Mr. Fiorini came to meet us. We went to his home, and immediately turned our attention to the beautiful Cyprian bees.

"Mr. Fiorini, with difficulty, had suc-

"Mr. Fiorini, with difficulty, had succeeded in gathering together 8 colonies at Lanarca, as he narrated in the description of his issue. at Lanarca, as he narrated in the description of his journey (see American Bee Journal, 1880, page 373).

Six of these colonies were put in small boxes especially prepared for the journey, and two were in their original hives or earthen jars. Yet, although the strengthen the poorest of them, some were yet very weak; the winter being innusually cold, he experienced great infliculty to bring them through the winter. These colonies were placed at a southern window, to allow them to go

out and discharge their feces, so necessary after such a long confinement. Every evening these colonies were brought into a warm room. Notwith-standing these precautions, two queens perished, leaving but 6 colonies alive. This misfortune had destroyed my hope Mr. Fiorini was willing to keep his word, and sold me two colonies, besides presenting me one of the earthen hives

senting the one of the earthen filves where the queen had died....
"Mr. Fiorini had not yet thoroughly examined the small colonies, hence I had the opportunity of seeing 7 Cyprian colonies and 5 queens. I noticed that the Cyprians, as well as the Italians, are not proceed that the first. not perfectly alike in color. In fact, l the others, and one colony where the color of the workers was perceptibly lighter than the copper-yellow of the

can be distinctly seen when the worker to be examined is impersed in alcohol. The corslet of the Italian worker is gen-The corslet of the Italian worker is generally of a uniform tinge which approximates black. There are, however, some colonies of Italians in which a few of the workers are adorned with the above mark of the Cyprian. This mark is moreover, always smaller and of a duller yellow, and, in fact, such bees are an exception, at least in the locality where I have had occasion to notice them This mark which in the Italian is an exception, in the Cyprian, on the contrary, is a fixed characteristic. Was the Italian bee original in the Orient: or trary, is a fixed characteristic. Was the Italian bee original in the Orient; or is this mark, which is sometimes visible on our bees, a phenomenon of atavism\*. Who knows?

Cyprian queens have no such mark for I have not seen it either in the directly imported queens, or in their queen

the Carlo and the

One of Mr. Fiorini's Apiaries, located at Merandole, Italy.

bees of the other Cyprian colonies. to this special color, I notice a curious coincidence. It is said that the first copper was found in the Island of Cyprus (a Cypro caprum dicitur). The name of Cyprian is therefore twice related to of Cyprian is therefore twice related to these bees, since they were first noticed at Cyprus, and since they are coppercolored. Both of these circumstances will probably perpetuate the name of Cyprian to those bees, although the same bees can be found in all Asia Minor, and in a large part of the East, as we will see. The most distinct mark of the workers of this kind has not yet been noticed, which consists in a mark of the same yellow as that of the abdomen, which in the form of a half-moon occupies nearly all of the third ring of

progeny. Every queen is without this mark. This fact seems to be very sinprogeny. Every queen is without this mark. This fact seems to be very singular. What is still more curious, is that, while the color of the hair and of the skin of the workers are generally vellower, the queens have the rings with black bands very well marked, but narrower than in the Italian. This does not mean that they are less beautiful—that depends on the taste. The beekeepers, outside the Alps, think a queen the more beautiful when the black color is least, because the preponderance of

these peculiarities, because some find these peculiarities, because some mind the Cyprian queens very fine, while oth-ers, looking for the test of purity in the increasing yellow color, find these bees not so beautiful, and because such a remark can have some weight on the sales

of queens.
"Mr. Fiorini, in bis journey to the Orient, gathered worker bees at Corfu, Jaffa, Ramble, Jerusalem, Mount Olivet, Bethlehem, St. John in the Mountain, and Beyrout, as he narrated in the Passariation of his journey (mage 373 of dain, and Beyrout, as he narrated in the description of his journey (page 373 of AMERICAN BEE JOURNAL, 1880). I examined these bees carefully one after nother \* All (about 50 in number) have, like the Cyprian, the third ring of the corslet yellow. All were, like the Cyprian, a little smaller than the Italian, although having been gathered on the continent, and that ten to no my mind. continent, and that too to my mind, proves that the smaller size of the Cypproves that the smaller size of the Cyprian is not the result of their inhabiting in island, a circumstance which generally influences the growth of other animals. I found some of these bees a little more yellow than others; but I had already noticed similar differences between the bees of the several colonies imported by Mr. Fiorini, and we know that it is usual among the Italian. Rethat it is usual among the Italian. Besides, as all these bees were gathered in the same phial and in small numbers, I was unable to know whether these small differences were local and constant, or

differences were local and constant, or only accidental.
"I examined the drones later. They are, among the Cyprians, more beautiful than either the queens or the workers. The hairs of the Cyprian are whitish; three rings of the abdomen, the nearest to the corslet and sometimes four are ground with the programmer. four, are accorned with copper yellow in their upper part, and this in all the coltheir upper part, and this in all the colonies, at least as far as I noticed. Yet the drones, like the queens, have not the yellow mark of the workers. In the Italian bees the drones are not all adorned with yellow, a large part of them having only some yellow marks, and a greater number of them being about uniformly black.

" As I said about the Italian workers, "As I said about the Italian workers, which have exceptionally the mark of the Cyprian, there can be found a few Italian drones, although very rarely, which are as yellow as the Cyprians; yet the Cyprian drones can easily be distinguished by the whitish color of their hair.

distinguished by the whitish color of their hair.

"According to some, one of the merits of the Cyprian bees is that they are less inclined to rear drones. Mr. Fiorini narrated that in the 8 colonies he found but about 10 square decimeters of drone cells (a square decimeter is about four inches square). The earthen hive which he gave me while I was at Monselice, had no drone cells; yet my observation in this my first year with Cyprians, did not confirm the persistence of this quality. I have some reason to think that the combs observed by Mr. Fiorini were those of after-swarms, or of first swarms who had built during a scarcity swarms who had built during a scarcity

of honey.

"As to the greater or less tendency to sting, I will wait for another year before pronouncing an opinion.

"To sum up. I do not think that there is the least fear of the Cyprian bees taking the first rank which was conceded to the Italian amongst the other races,

\*Count Gaetano Barbo, the writer of this article, is a very good microscopist.—CH. D.

and that in spite of the popularity that in these late years they have acquired, and by which, of course, the queen-breeders will profit. Yet, I think that a decided advantage will be gained in the direct importation of this beautiful ways, but the cressing between our less. race, by the crossing between our best queens and the drones of Cyprus.

The Cyprian bees were the great, but not the sole aim of our journey. Knowing that the apiary of Mr. Fiorini was among the best in Italy, and the skill with which he manages his bees, I

was in great expectations. I am happy to say my anticipation was exceeded.

"Mr. Fiorini had wintered over 500 colonies of bees in 3 places and 4 apiaries. One of these places with 2 apiaries. ries. One of these places with 2 apiaries, each of 100 colonies, is in the garden adjoining the residence of Mr. Florini, at Monselice. Another apiary of 200 colonies, of which I give the engaving (see Birst page), is in one of the properties of Mr. Florini, in a place named Merandole, and a third in another property, numbering above 100 colonies.
"The apiaries or bee-houses of Mr.

"The appartes of bee-nouses of Mr. Fiorini are made with roofs covered with tiles, and supported by wooden plates and rafters, under which a long and solid beam holds two stories of hives. Every one of the posts has an iron foot which is plunged in a small attent received to the contract of which is plunged in a small stone recipient of water, in order to obtain a complete insulation. All the

hives are three stories high.
"Some of Mr. Fiorini's hives are
double and even treble, and which can
be reduced to one by taking out the partitions. Experience has taught him, as well as a number of others, that the best well as a number of others, that the best way to obtain the greatest amount of honey is to repress natural swarming. In spring he chooses from his colonies the most populous, which he puts in the triple hives; as soon as one of the compartments is full he takes out one of the division boards; when both these compartments are full, he takes out another partition. With such management, he obtains over 30 kilo. (66 lbs.) of honey, with enough honey for the bees to winter on.

ter on.
"The apiary at Merendole faces the The appary at Merendole races the east. The sun warms it only for half a day. When the bees return from the fields loaded with honey in the afternoon, most of them, before entering the hive, alight on the ground, which is cold, and are unable to repair to their hives. If the night is a little cold, and if the sun does not shine the next morning most of them are lost. Mr. Fiorini, to obviate this inconvenience has 4 men, who with gloves gather the bees in large pans, sometimes in great quantities. These bees are put in a warm room and

enabled to return to their hives.
"When I visited the apiaries of Mr Fiorini, only one was occupied; all the hives were gathered, in a large room near each apiary, seenre and dry in a temperature which does not go under -competature which does not go under -1 nor over +1 (from 30 to 34). A humming a little stronger could be heard when we entered this winter repository.

Every one can imagine how great the work to manage such an appary. Such an undertaking could not succeed Such an undertaking could not succeed but for the good order which I have admired at Mr. Fiorini's. Two large rooms are used—one for the preservation of the combs, the other, facing the north, is the working-room. In 2 large cuphoards are gathered thousands of combs, empty or filled with honey. In a third cupboard are the small combs used in shipping the 800 queens that Mr. Fiorini exports annually.\*

"Mr. Fiorini showed me also his correspondence with the Italian Secretaries of State and of Agriculture, and with his agents in the Island of Java, in order to attempt the direct importa-

in order to attempt the direct importa-tion of the Apis dorsata, which is larger than ours. With a great deal of persist-ence, Mr. Fiormi had nearly succeeded in importing this race of bees, as I could see by the following letter communica-

ted to him by the Secretary of State, under date of Aug. 18, 1877:
""SIR: In compliance with my letter of March 28, I present to your notice a report which comes to me from the royal consul of Singapore. This royal functionary writes me that in compliance with information directed by Mr. Van Oosterzee. consul to Batavia, and of Messrs. Tidman, Balfour & Co., Mr. Ferrari, of Buitenzorg, who was intrusted with the search for bees in this Island, has succeeded, in some places in procuring some of these bees.

in procuring some of these bees.
"In view of the desire of Mr. Fiorini in procuring some of these bees.

"In view of the desire of Mr. Fiorini to import these bees, and thinking your signory would prefer the successful sending through the peninsular line, I have taken steps to send them directly from Batavia to Venetia, through the English line, with a recommendation to the agency of Singapore, to take all possible precautions for the transportation and the placing of the boxes on board. I beg your signory to bring to the notice of Mr. Fiorini the forthcoming arrival of the desired insects, so that he may be ready to take steps for their reception. G. Monniell, "Mr. Fiorini was planning a bolder scheme, and he had for a long time spoken of it to me, but the American Benton has the start in going to Java, as appears from his letters published in the bee papers. As everybody will see, Mr. Fiorini has more than one claim to the public gratitude, and the President of the Central Association, in giving him the gold medal was but the inter-

of the Central Association, in giving him the gold medal, was but the inter-

reter of the unanimous wish of the Italian bee-keepers.

'If these lines should induce some bee-keeper to visit Mr. Fiorini, I will be glad of it, for such a visit will be productive of precious practical notions; of averagement, and of the convict of encoaragement, and of the conviction of the unexceptionable importance of our pursuit. In remembrance of the ively and cordial reception and of the indefatigable condescension in satisfying my insatiable, and at times indiscrect curiosity, I send to the bee-keeper of Monselice an apiarian greeting.
"G. Barbo."

For the American Bee Journal.

#### The Central Idea in Wintering Bees.

J. W. MCKINNEY, M. D.

In consideration of the unusual mor-

In consideration of the unusual mortality among bees the past winter, all through the States lying north of the State of Tennesee. I am disposed to state my success in wintering.

As spring is now fairly established, and all danger from spring dwindling is passed, we can the better judge of the full merit of this or that mode of wintering bees. Many reports made in the months of February and March of successful wintering, will prove premature and have to be largely revised; for to my certain knowledge, in this section of the certain knowledge, in this section of the country, many colonies that had strug-gled through five months' of cold winter-weather, perished during the first part of April.

part of April.

For many years it has been a matter of surprise to me that there should exist such diversity of opinion among aparists in regard to the best mode of successfully wintering bees in the Northern States. Every thoughtful and observing apiarist must know or ought to know, the more quiet bees are kept the better they will winter. The page evenly a temperature between 35more evenly a temperature, between 35-45- is maintained in the immediate vicinity outside the hive, the better they winter. The purer the atmosphere that enters the hive, the better they winter. With these conditions and a sufficiency of honey in the hive, all doubt can be obviated about successfully wintering

Can these conditions all be secured can these conditions an be seemed and maintained in any place so easily as in a cellar? If not, then why take the hazzard of out-door wintering? Pack them as you will on summer stands, in chaif, or whatever else you please, you hardly expect to control the

tering was lost sight of: viz., that of maintaining a low, even temperature.

I know some of our very best apiarists who lost sight of the importance of ists who lost sight of the importance of this, and resorted to frequently heating their cellar by means of a stove last winter. The result of this uneven and sometimes high temperature, was dis-astrous to the bees. Though in a per-fectly dark cellur, brood-rearing was befectly dark cellar, brood-rearing was begun early in the winter, which naturally shortened the life of the old bees, and as the young bees were deprived of the necessary flight when one or two weeks old, the result was disease and death of many colonies. Much worse results followed, however, in this vicinity where bees were wintered out-of-tears of over cent at least having were

ity where bees were wintered out-ofdoors, 80 per cent at least having perished in this and adjoining counties
during the past winter.

Now for the manner in which I wintered my bees: With the assistance of
a hired man, I put 50 colonies of bees
in an under-ground cellar on October
23 last. On November 11, I put 70 more
in the same cellar. Of the above 120
colonies, 23 were nuclei and 27 were
weak in bees and light in supplies,
leaving but 70 in good condition for
wintering, as regards quantity of bees leaving but 70 in good condition for wintering, as regards quantity of bees and ample supplies. I took some out and placed them on their summer stands March 21. Those first put in the cellar, were not removed till April 7th. The continued cold weather kept them from taking a cleansing flight till April 14th, thus having been confined to their hives for more than 5t4 months, (or 173 days.) thus having been confined to their hives for more than 51½ months, (or 173 days.) On moving them from the cellar, I found 2 standard colonies dead, having been smothered by the entrance becoming closed, and 3 of the nuclei having consumed their supplies, had died. Some 4 or 5 of the weaker nuclei chilled to death during the latter part of March, and first part of April, leaving 110 colonies that wintered safely through this long cold winter in my under-ground cellar, at a temperature never above 45- nor below 33°. Camargo, 111., April 28th, 1881.

#### Shall Bees be Fed in Winter?

L. 11. PAMMEL, JR.

The following article on the above subject, by Dr. Dzierzon, is from the Beinen-Zeitung:
"Too much boney in the fall is dan-

"Too much honey in the fall is dangerous, as all the cells will be filled with honey, and the bees will have a very cold place to winter in, and the consequences are that many dead bees will be found in the hive. Bees, like all other animals, require as small a space as possible in which to contract themselves and keep warm. They are not only found to occupy but a small space between the combs, but in many of the cells bees can be found; perhaps more are found can be found; perhaps more are found in the cells than between the combs. Now, if the cells are filled with honey the cluster will be of an unequal size, the cold sheets of honey will cause dampness, and the uncapped honey become some and watery and lose its encome sour and watery and lose its en-tire aroma. This is only the case with honey as soon as breeding stops. If the honey is distasteful to the bee, some other honey should be put in its place. It is, therefore, advisable to take away some of the sealed boney and store it for winter use in feeding, as this feeding can be done to great advantage when the bees take a purifying flight.

"It is still better to have 3 or 4 colonies in one hive if possible, and place

small partition boards, with holes, be-tween the brood and honey chamber, and put some honey in the storage cham-ber, by first removing the moss or hay; in this way bees can be fed without dis-turbing them or causing excitement.

"But should you give sugar candy or anything of that nature, bees will eat dangerous to the bees than a disturbance, especially if everything is closed so that they cannot fly out; for if they are disturbed they exhaust themselves in attempting to get out. Therefore it is better never to close the entrance entirely, unless for transportation, for it is much better to lose a few hundred bees in this way than to lose the entire colony. No sensible bee-keeper will feed his bees after a fresh fall of snow, or during the prevalence of a cold wind. feed his bees after a fresh fall of snow, or during the prevalence of a cold wind. Not many bees will be lost when it is quiet and cold, as they soon experience a chill and quiet down. It is always best to feed bees at durk, as they will not then endeavor to fly, and all danger from excitement will be avoided."

#### How to Test Italian Queens.

o. H. TOWNSEND.

The method in general use is as follows: If all the workers show 3 yellow bands they are classed as pure Italians, and this is carried so far as to advise the bending of the bees, or placing them on a window, in order to discover the bands. I am sure the above rule has caused many a colony of hybrids to be classed as pure Italians.

I have several colonies of hybrids which are ½ black in blood, the worker bees of which all show the 3 bands, without bending or placing them on a window.

This method of testing Italian bees Ins method of testing realian bees has led many to believe that the dark Italians are crosser and more inclined to sting than the light ones. As I am ready to defend the dark Italians I shall ready to defend the dark Italians I shall tirmly plead for them—"not guilty." Some who have Italians, and some well-marked hybrids, call the latter dark Italians, and they do not wish to use queens from the latter because they were too cross. These hybrids showed the 3 bands, when the above directions were followed, or, "when we looked for them right," by bending the body, using plenty of smoke to cause them to fill their sacks with honey, or placing them on a window, etc.! I am not personal. I only write to discuss the method of testing queens, which, acbadant the translator.—ED.

#### Chaff Packing-The Result.

J. H. TOWNLEY.

The old reliable and ever welcome BEE JOURNAL makes its regular weekly visits filled with interesting and valuable information upon all topics connected with bee-keeping. The past winser has been worse than the winter of 1842-3. Cold weather then commenced Nov. 17 and continued until near the last of March, but we had warm weather by April 1. This year on April 3 its nowed, and the 2d it was out of the 2d it was only 17 its part of the 2d it was only 17 its part of the 2d it was only 17 its part of the 2d it was only 17 its part of the 2d it was only 17 its part of the 2d it was only 17 its part of the 2d it was only 17 its part of the 2d it was only 17 its part of the 2d it was only 17 its part of the 2d it and on the 2d it was only 7° above zero. In 1842-3 I was so unfortunate as to lose all the bees I had, one "skip" in a hollow log, but found another one in April with which to commence again, and have been without bees but 2 years since. Chaff; Oh yes, chaff! how about chaff now? As I was the first to bring chaff

now? As I was the first to bring chaft packing as a winter protection to bees before the bee-keeping public (in Gleanings), I am again receiving letters in relation to it, while some of the writers intimate that the "baby" is dead or dying, others seem to be just a little "sarquastic; "for instance, as follows: "How do you manage to winter your bees on chaff? Do you give it to them clear, or do you mix it with honey, sugar, or glucose? Do you cook it or do you feed it raw? Do you have it ground or feed it whole? Will it not produce dysentery if fed whole without

produce dysentery if fed whole without

olting?" etc.
It has now been 10 years since I first thas now been to years since I hist commenced wintering bees packed in chaff. I have heretofore been very successful with it, but the present win-ter has been a little too much for the chaff. The winter commenced early. The last good flight the bees had was in October: from them until the 6th of October; from then until the 6th of March they were kept in their hives by cold weather. Bees have died all around me in cellars, out-doors, and, in fact, in me in cellars, out-doors, and, in fact, in all other ways of wintering them. Whole apiaries, consisting of 2 or 3 colonies up to 150, each have been swept out of existence, leaving nothing but hives and combs. Last season was very poor here for bees; but few colonies stored any surplus honey; hardly enough was collected during the fall crop to keep up breeding; they went

into winter quarters light in numbers and weak in stores; I was away from home, too, when I ought to have been there preparing them for winter, and they were not put up as they should have been. As a consequence, all I have left now is 51 colonies.

Tompkins, Mich.

For the American Bee Journal.

#### Wintered well in Chaff Packing.

C. W. MCKOWN.

Last fall I had 21 colonies of Italians in double-walled hives, with 1 inches of space between the walls on every side of the bees. I packed this space full of dry wheat chaff; gave no ventilation at the bottom, but the entrance, 1<sub>2</sub>x4 in. I used boxes as large as the body of the hives, 6 in. deep, with common mus-lin for bottoms. These were filled with the same kind of chaff and placed in the hive, and the caps were put on over all. This gave no top ventilation except all. This gave no top ventuation except what could pass through the chalf box and out between the hive and cap. In place of a honey board I used a piece of thin cloth on some, one thickness of home-made carpet on others, or a heavy woolen cloth. The frames I use are 11<sup>3</sup>4 in a pick measure. My here were in wooien cioin. The frames I use are H<sup>3</sup>4 in., in side measure. My bees were in good condition in the fall, but some of the honey was not capped and consequently soured and caused some mold. Some of these colonies did not fly from Nov. Is to March 15; others flew a little 3 or 4 times between these dates. My less in those 21 calonies are some model. loss in these 24 colonies was one, which by some unaccountable blunder was "chaffed" only on 2 sides. There were some dead bees in all the hives, and dysentery in several, though not very bad in any but one; this I surely would have lost in March had I not reserved to redical treatment. One day sorted to radical treatment. One day in March I found the bees daubed and the horizontal to move or fly; so I took the honey cloth off and let the sun in between the frames. The bees soon began to roar and crawl all over the hive. Many flew away and never returned, others crawled out and back. About <sup>1</sup><sub>2</sub> the bees never returned, but those that did were cured, and now it is a good colony. But the color of the hive was colony. But the color of the hive was changed from clear white to dirt brown.

Bees packed in this way are not affected by a solitary warm day—it takes about 3 of such to bring them out. Some moisture accumulated in the chaff some moistine accumulated in the chain over the cluster, and I repeatedly lifted off the caps to let the sun dry it. In March, when I wanted to force them to fly, I took the caps and chaff boxes off and let the sun shine on the honey cloths. This brought the bees out in a few minutes. I had 9 other colonies in cloths. This brought the bees out in a few minutes. I had 9 other colonies in single-walled hives; the caps filled with wheat chaff and about 12 inches of the same on the outside, covered with boards. Of these I lost one. So my loss in 33 is only 2. Some tell us of failures with chaff, but they do not tell us what kind of chaff was used how tailures with chaff, but they do not tell us what kind of chaff was used, how much, or in what way. I believe the chaff hive theory is correct, and the failure is in the manner of doing it. The prospect for a good honey season here is excellent. There is an extra fine crop of white clover coming on.

Gilson, Ill., May 2, 1881.

#### Eastern Michigan Convention.

The Bee-keepers of Eastern Michigan met at Detroit on May 3, and formed the Eastern Michigan Bee-Keepers' Association, with the usual Constitution and By-Laws.

The following were elected officers for the ensuing year: President, A. B. Pierce; Vice-President, Wm. Morhous; Sec., A.B. Weed; Treas., J. G. Sanborn.

The chief topic of discussion was the comparative merits of imported and

Mr. Hinst thought that blood was as likely to "run" one way as the other. likely to "run" one way as the other. He believed that Americans surpassed the Italians in skill in breeding. Mr. Holbrook said that Italians would

not run out if the drones in the neigh-borhood were of the right kind.

Mr. Herberstnie had had black bees that ran to Italians because there were

Italian drones in his neighborhood.

Mr. Holbrook said that the same principles applied to the breeding of bees as to cattle.

Mr. Pierce said that American bred

cattle were equal to imported.

Mr. Weed thought that frequent importation of fresh blood precluded the

possibility of improvement by selection.

The question "why do bees swarm out in the spring "elicited much interest. The conclusion was that it was because of uncomfortable quarters.

Mr. Hunt and Mr. Morhous had some that swarmed out this spring, when the closest examination revealed no cause.

Mr. Holbrook said that there was yet

much to be learned about bees Mr. Kleinow had observed that a slight covering, if dry, was better than a heavy one if damp; he considered ventilation above the chaff necessary.

Minor subjects were discussed and the Association adjourned to April 11, 1882, at Detroit. A. B. Weed, Sec.

Read before the Central Michigan Convention

#### The Lesson of the Winter.

PROF. A. J. COOK.

I do not know that Shakspeare was a bee-keeper, though he seems to have been almost everything; or at least to been almost everything; or at least to have been intimately conversant with all kinds of men and their various crafts; but I do know that his "sweet are the uses of adversity" is specially pertinent, after such a winter as we have just experienced, and may well serve as the text of an address to practical bee-keepers.

As many who have suffered sore losses will wonder where we can see aught of sweetness, I propose, on this occasion, to indicate just where we have received value from the unwelcome losses of the past severe winter.

We have previously learned that to winter our bees on the summer stands, with no protection, was neither safe nor wise. Bees thus neglected may pass safely through several winters. But he wise. Dees this neglected may pass safely through several winters. But he who trusts his bees, with no protection from the full sweep of the winter's blasts, can never be certain that his pets blasts, can never becertain that his pets will live to greet the sunshine and bloom of the coming spring. Past experience has also taught us that good cellars, thoroughly adapted

that good cenars, thoroughly analyted to the requirements of our bees, were safe, and could be safely trusted with our little insect servants, even though the storms raged in maddest fury for tour or five months. The past exceptionally severe winter has been valuationally severe winter has been valuations. ble in showing that this opinion was in no wise vain. Good cellars are again vindicated as the most secure places in which to winter bees.

which to winter bees.
We have also been taught by our practice in the past that chaff hives, or packing about the hives with chaff, sawdust, or straw, would aid to ward off calamity in severe seasons, but we had not had such a trial as would warrant us in pronouncing them wholly rant us in promoting them windly safe. The past winter has furnished a crucial test. The verdict is an important one. This seems to call in question the trustworthmess of the heavy, costly chaff hives, and certainly pronounces against the efficiency of the method of packing. A good packing box will cost, at least, \$1, which will be the extra cost of a good chaff hive. These latter are, besides, inconvenient and awkward. Now if the past winter is fruitful in convincing bee-keepers that such packing boxes and hives are insufficient, and thereby saves to each bee-keeper \$1 per colony, it will not be wholly in vain; and we shall be able to see some use in adversity.

Again, the past winter has shown that The past winter has furnished a

Again, the past winter has shown that celiar wintering saves no small amount for 2 winters of honey. Colonies wintered out-doors, even though well packed, have eaten 20 ter through.

working qualities of the two kinds. or 30 lbs. of honey, and in some cases He was of the opinion that Italian blood would run out. seem actually to have starved to death, after eating all their stores, while colonies in the same condition have Wintered in the cellears on less than 13 the amount of honey. The extra honey amount of honey. The extra consumed is worth \$2 a colony.

More than all this, the bees are also dead, which adds 88 to the loss. It will quickly be seen that a few colonies of thes will pay all the expense of a good cellar, or of converting a poor one into one that is suitable. The present winone that is suitable. The present win-ter has more than ever settled the ques-tion in favor of good cellars for winter-ing bees in all the Northern States of

our country.

Last autumn all our colonies of bees at The the Agricultural College were strong, and were provisioned with about 30 lbs. of good capped honey to the colony. On Nov. 10, ½ were packed in straw—the packing being one foot in thickness—and immediately above the bees there was placed 6 inches of chaff. One of these colonies was also in a Shuck hive. The other half of our bees were, on the same day, placed in the cellar. Just 5 mouths later, on March 10, all were examined and permitted to fly. There was no suitable opportunity previous to this date. Those in the cellar were all in good condition, while each colony had over 20 lbs. of honey. Half of those out-doors were already dead; the others were suffering in no small degree from the dysentery, though the colony of good capped honey to the colony. On Nov. 10. 1a were packed in straw—the from the dysentery, though the colony in the Shuck hive was in far the best condition. On the evening of March 10 I placed all in the cellar except the colony in the Shuck hive. Since then one, which was reduced to a mere handful of bees, has died in the cellar. The colony in the Shuck hive is no more. colony in the Shuck hive is no more. This hive was warranted, I believe, to be all-sufficient, without any packing. Warrants do not always save bees. Had I removed this colony to the cellar on March 10 I feel sure it would have remained with us. I do not regret, however, that I gave the hive the trial, though I do regret the result.

The great sine qua non to successful wintering of bees, next to a sufficiency of good honey, is a uniform temperature, neither too hot nor too cold. Too much heat irritates, induces uneasiness, over-eating, and, if the bees are restrained from flight, death. Cold likewise stimulates to activity, that the bodily heat may be kept normal; un-due eating follows as a necessity, and, as before, with prolonged continement

comes death.

With such prolonged cold as we have had the past winter, the best chaff hive or style of packing will prove insufficient to maintain this uniform temperature, which should range from 35- to 45- F. But a well-arranged cellar will secure this desideratum, and so may always be counted on to bridge over calamity with bees that are in good condition in the fall, and that are provided with sufficient good capped honey; and as we have seen, it requires the minimum amount, if we winter in a good cellar.

A uniform temperature in a cellar A uniform temperature in a cellar may be secured in either of 2 ways: First, by sub-earth ventilation, where the cellar is constantly supplied with fresh air drawn 30 to 40 feet through the earth, quite below the freezing point. Or, secondly, by keeping a large body of water in the cellar. This, as in our cellar, may be accomplished by arranging the out-flowing drain pipe so that it will be higher than the bottom of cellar.

A better way would be to have the cellar well dramed, and have a large cistern in it. As you all know, such a body of water would serve excellently

body of water would serve excellently well to modify temperature, keeping it warm in the cold winter days and not suffering it to rise during the warm days of winter and spring.

I fully believe that in a cellar thus prepared, colonies of bees which were in good condition in the fall, might remain for 6 months in prime condition. main for 6 months in prime conduction. Two small nuclei in our cellar survived until March, the past winter, and then only died because the water raised till it covered the bottom boards, owing to our floods. The old idea that a cellar must be dry to be safe for bees, is not towards in fact. Ours has warried well. tounded in fact. Ours has worked well for 2 winters, and has had from 4 to 8 inches of water in it during all the win-

#### THOMAS C. NEWMAN.

We can only give conjectures, and these are not always reliable. market for our products; uniformity in Though we fall to-day, we should spring the queries? We can only give conjec-

#### Retrospective and Prospective.

Until the founding of the AMERICAN BEE JOURNAL, some twenty years ago, but little thought had been devoted in this country to bee-keeping as an occupation, and still less to it as a science. True, many kept a greater or less number of "gums" or "skeps," and a few, comparatively very few, master minds had conceived rational scientific views regarding many of the internal mysteries of the hive; some had to an extent comprehended the physiological history of the honey bee, but they were so very few that their wisdom was almost covered with disrepute by the ignorant and superstitious ideas of the masses, who kept bees as did their great-grandfathers, and whose comprehension had only kept pace with their improvements The master-works of Rev. L. L. Langstroth and the late M. Quinby gave rise to much thought and study, which in turn led to experiments, and these created the necessity for a periodical, in the columns of which new discoveries could be heralded, accepted theories be discussed, old prejudices be combatted, and apiculture be elevated to its proper position among the progressive sciences.

That much progress has been made during the twenty years of the Bee Journal's existence all will acknowledge. Many doubtful problems have been solved, and new ideas promulgated; all the standard works on apiculture have been revised time and again, as published experiences have proven to the several authors that their books inclined to error, and none but the most conceited have dared to assume that they knew it all. In nothing, perhaps, has opinion been more divided than upon the subject of preparing bees for winter, and here, again, the BEE Jour-NAL has fulfilled its mission in publishing the hundreds of letters giving the results of last winter's experimentsfor mostly they were experiments. As we foreshadowed in our issue of February 9th, the winter has been disastrous alike to the veteran and the novice, the specialist and the amateur; where loss was least expected, it has been as heavy as where success was not anticipated. It has but demonstrated that no general method is absolutely certain, and to our mind it has proven that in the Northern States there is much less risk in a properly prepared cellar or bee-house, than in any other method in general use. Of course, there are anomalous exceptions, but they are not numerous enough to establish a rule.

While we fully sympathize with many whose losses have been peculiarly trying as individuals, we feel almost tempted to congratulate the bee-keeping fraternity upon the disasters of the past winter. We think we can see many ways in which good may arise from it. It will discourage and drive out of the business many laggards who have only kept bees because they had them to keep; who have kept down the price of good honey by selling their poorly-prepared commodity for what it would bring, because it had cost them nothing. This class of people will probably give it up, or adopt more progressive ideas. The honey plants there, or are the winters thinning down of our numbers will also too long for them to do well?" Will prove of great assistance to our Societies and Conventions in uniting beekeepers upon the general issues: an-

preparation for market; a good, living price for an honest article; a general dissemination of scientific and practical knowledge, and the cultivation of a feeling of fraternity among the beekeepers of America. Should these results be attained, the experience and losses of the past winter, while causing temporary commiseration for a comparative few, will be a source of congratulation for all in the future.

Bee-keeping, heretofore, has been an occupation influenced largely by local and spasmodic causes. Two or three seasons of plentiful yield and good prices were sufficient to induce scores of unthinking persons to start in the business; if a good honey-flow rewarded their efforts, prices immediately declined—but if the season was poor, bees were disposed of very cheaply, or Provdence was depended on to protect the bees till a remunerative season should come. And this is the class of persons who have persuaded themselves that box hives are as good as any, and success in bee-keeping "depends upon luck." They have mostly quit the business!

On page 84 of the Weekly BEE JOUR-NAL for March, we indulged in some speculations regarding the prospects for this season, and the favorable outlook for an abundant honey flow. Our subsequent correspondence convinces us we were not over-sanguine. White clover was never more plentiful, and the sod is well matted; basswood buds are bright and green, and they lavishly promise, while wild flower plants exhibit a thriftiness seldom equalled. From the South come reports of gratifying honey yields, while in the Central and Northern States bees are thriving remarkably well, and vegetation every where, though tardy in starting, is making amends by its unparalleled rapid

We estimate the losses the past winter in the North at over 50 per cent., but there will be larger gross receipts in cash if even only 25 per cent, of the bees are saved, than have been realized the past two seasons, as the honey flow will be abundant, prices rule high, and reckless producers out of the market. We cannot advise any one to go into the beekeeping business-nor into any otherbut we do say, if any one contemplates ever going into it as a specialty, they will never find a more encouraging time than now.

To our unfortunate friends we extend our sympathy-no, not sympathy, but encouragement. Fill up your hives immediately-build up strong; one or two failures should not. will not, drive you from a chosen occupation. Look well at every occupation; what one affords the facilities for retrieving losses? In what occupation can you engage where success is more certain?

"If at first you don't succeed, try, try again ; You will conquer, never fear, try, try again."

The following letter is from one of the progressive men of the age:

I have been very much interested in the reports giving the successes and failures in wintering bees the past cold winter. I fully sympathize with the unfortunate ones in their losses and disappointments. It is a bard blow to very the results of the state of the many. Bee-keeping has its ups and downs, like all pursuits. The man that plants to day is not sure of a crop of grain; he who rears up a flock of sheep knows not but that to-morrow they may be cut down by disease. But the old maxim is quite as true to-day as ever:

to our feet to-morrow, and try again. Perseverance is the mainspring to success, and the man who has good hives

cess, and the man who has good investand plenty of combs, can very soon work up a good yard of bees. Take courage; go ahead, and all will be well.

I put 90 colonies into a winter-house on the 22d of November; they had a few hours' flight on the 15th of March; put them out the 9th of April; found one they are appeared. dead and two queenless. Since they were put out two more have died, making, up to date, three dead and two queenless. I put the queenless colonies with the others.

I never had my bees, taken together, look better or stronger at this time of year. I have had orders for all of my bees, but sold only ten colonies. I can only say, respecting other bees for many miles around here, if reports were given they would about tally with the reports given in the BEE JOURNAL—very heavy losses. R. BACON.

Verona, N. Y., May 9, 1881.

We commend the foregoing sensible letter to those who are doubtful as to the future, and beg to assure them that they need pluck, more than sympathy. No one's loss, however great, has been as bad as it might have been.

#### Forcing Bees to Work in the Boxes.

Mr. J. W. Hinsdale, of Raleigh, N. C., under date of May 11, says:

"I have some 30 colonies, but cannot get the bees to work in the upper sto-ries, though the colonies seem very strong, and there is a fine honey flow at this time. What is the best thing to do?"

The brood-chambers are too large; that is, the queens do not keep them sufficiently packed with brood to prevent the bees storing considerable honey there, and they become loth to leave the brood unless forced to do so. The best course to pursue will be to take out the outside frames, which you will find well filled with honey, and put division boards in their place; if any others are filled with honey take them out, extract the honey, and replace them in the center of the brood chamber only as fast as the queen can use them. By thus contracting the broad chamber, you will force the workers up in the second story before they have made preparations for swarming, and once there, they will be slow to encroach on the queen's domain in the lower story. The size of the brood chamber is the only tenable objection that can be nrged against the standard Langstroth hive with ten frames, and we have found them none too many in breeding up, and easily lessened when the sections were neglected. Many of the most successful apiarists use hives holding only seven or eight Langstroth frames.

The bee-keepers of Missouri will meet in Convention at Mexico, Mo., on June 2, 1881, at 10 a.m., and hold a session two days. Dr. N. P. Allen, of Smith's Grove, Ky., President of the North American Bee-Keepers' Association, is expected to be present to assist in organizing a Bee-Keepers' Association; other leading bee-men are expected, due notice of which will be given. The programme will be published in a short time and will embrace such questions as will be of interest both to the novice and practical apiarist. All are invited to partake of and assist in this much needed organiza-tion. Those that cannot come will contion. Those that cannot come winconfer a favor by giving us a communication on some subject of interest to beemen. P. P. Coller, Vice Pres. N. A. B. K. Association, for Mo. All papers of Missouri please copy.

1881.

#### GLEANINGS.

Mr. Geo. Grimm reports having "lost 35 colonies out of 431." Including the dwindling in spring he does not think it will reach 10 per cent, of loss. He then adds: "In my chaff-hive apiary (consisting of one colony) I lost

He is Greatly Puzzled.—Novice says:
—Neighbor Shane, with an apiary of about 190 colonies, has not lost to exceed 10 per cent., and wintered out-doors at that. The hives were ordinary Lang-stroth hives with chaff cushions over the frames. He borrowed one chaff hive from us, which wintered without a loss of over 2 dozen bees, and consumed much less stores than those in his other hives. Although he always wintered in cellars until of late, he now thinks he will winter out-of-doors next winter. I confess I am greatly puzzled.

#### BEE-KEEPERS' EXCHANGE.

Profil by Experience.—As the weak of all kinds, whether of men, animals or plants, are the first to succumb to disease and death, may we not console ourselves that the bees remaining after the recent severe winter are a hardy race, capable of wintering with less percentage of loss in future seasons, and are in addition a class of bees that will centage of loss in future seasons, and are in addition a class of bees that will multiply rapidly and thus, very soon again "fill the earth?" The proverb says, "there is no great loss without some small gain." This we think is true. Undoubtedly many a shiftless bee-keeper will drop the business; others having lost all their bees will throw away their old ambliances and beginaway their old appliances, and begin-ning anew will adopt a better class of ning anew will adopt a better class of hives and management; while others, having gained knowledge from the success of their neighbors in wintering, will more effectually protect their bees in winters to come. Like philosophers, we must profit by experience, hope for the keet and average for the worst. the best and prepare for the worst.

Rapidly.—Owing Increase Rapidly.—Owing to the great loss of bees this past winter there will be put forth an extra amount of energy in the direction of rapid increase of the apiary. Already inquiries pour in asking how best to restock the depopulated colonies. The requisites are, a few strong colonies a lot of always. Increase populated colonies. The requisites are, a few strong colonies, a lot of clean, dry, empty combs, or, better still, a liberal supply of Dunham foundation, hives so arranged that close-fitting division boards can be inserted, and time, knowledge and energy enough to perform all the needful operations at the right time and properly. To this should be added a bountiful yield of honey, after which we might reasonably expect 5 colonies to be increased to 50 good ones by fall.

Report of the Nellis Apiary.—Our own bees were removed from winter quarters on April 8. The loss at that time was about 15 per cent., and after a period of 2 weeks, from uniting and dwindling, the loss amounted to about 25 per cent. We think 2 or 3 colonies starved, not that they were so short of stores, but for some unaccountable reason, some colonies consume nearly twice as much as others, when the con-ditions and treatment are equal. The ditions and treatment are equal. The mice had evidently secreted themselves in the hives during the fall, and had made havoc in a few hives despite our efforts (partially successful) to trap them. We were diligent to contract the entrances in autumn. but the warmth of the hive and the cosy chaff cushions of the hive and the cosy chair cusmons were a great temptation. Providence permitting, we will effectually exclude the little rascals another fall by the timely application of perforated tin to the entrances, that will allow the bees to pass freely, while the mice can only small in the provider of the cost of the cos

splendidly; later they were somewhat uneasy. Observation shows that the colonics worked for surplus honey have wintered well, while those used for queen rearing were the fated ones, the "tinkering" in fall being the probable cause of their failure. Pollen is now being gathered, and at this writing, April 25, the weather is warm and very dry. We earnestly hope that contrary to the past few seasons, we may get a damp, rainy spell in May, and dry, sunny weather in June, when the great white clover harvest comes. white clover harvest comes.

#### BEE-KEEPERS' INSTRUCTOR.

Future Prospect. The Editor says: -We have been using every effort possible to get at the mortality, and have, sible to get at the nortality, and have, we think, arrived at a pretty fair approximation of the losses of the winter. We are able to make our estimates from reports of nearly 15,000 colonies reported to us and other bee journals. These reports are mostly from the Northern States, and show when taken in the aggregate a mortality of 55 per cent. We are satisfied however that the mortality is even greater than this, in the northern portion of the United States and Canada. We base our opinion on the ground of hundreds of small bee-keepers of whom we hear, but of on the ground of infindeds of shall bee-keepers of whom we hear, but of whom we have no report, naving lost all they had. Our conclusion is, thereall they had. Our conclusion is, therefore, after a full survey and investigation of the situation, that the losses north of the 38th parallel will be about 65 per cent, of the colonies placed in winter quarters, while many of those that survive come fbrough very weak. South of this parallel we think 25 per cent, will cover the losses. Discouraging as this state of affairs annears, we ing as this state of affairs appears, we are daily in receipt of information that are daily in receipt of information that bee-keepers are generally looking for-ward hopefully, with the full determi-nation to make the most of their pres-ent resources, and to build up again as rapidly as possible. There appears to be a general feeling that we are going to have a good honey season, and while to have a good honey season, and while the amount of honey produced may not be as large as usual, better prices are expected. Many will no doubt run their apiaries more for increase than for honey....By close attention and ju-dicious management the severe disas-ters of the peet winter may be greatly ters of the past winter may be greatly overcome, and for the future turned to advantage, if the lessons we have learned from the past are not too easily forgotten.

#### MISCELLANEOUS.

King Birds and Bees. - The Rural New Yorker says :

We are of the opinion that the king We are of the opinion that the king bird catches not only drones but workers and queens also. Examination of the king bird's crop scarcely ever reveals the presence of bees except in such a condition as to be quite beyond identification. A gentleman once noticed a king bird catching bees and, on close observation saw small particles drop to the ground which proved to be both the bees' extremities, and he concluded that the bees were caught in such a that the bees were caught in such a manner as to secure the honey-sac only. If this be true, search for bees in the king bird's crop would be in vain.

Peach Trees Killed .- The New York Express says:

Express says:

There is no hope any longer entertained by the fruit-growers of Delaware of any profit from peaches in that State this season. It is said that not in 25 years has there been a worse showing, and the belief is that a great majority of the peach trees have been killed, while all the rest have been so severely injured as to make them useless. If this be indeed true the loss will be very serious, for no less than \$5,000,000 are invested in peach cultivation on the peninsula, of which more than half is invested in Delaware. than half is invested in Delaware.

Bee-keepers will have lots of company in disasters this year, among the entrances, that will allow the bees to pass freely, while the mice can only smell in.

Up to the middle of March the bees were very quiet and seemed to winter the bees will talk of giving up.

pany in disasters this year, among fruit-growers, cattle-raisers, and farmers whose wheat winter-killed. But none who are progressive in any of these branches will talk of giving up.

Cellars for Wintering.—About % of the bees in this locality are dead; in fact all who did not winter in a good cellar have now no bees worth mentionany kind of packing on the summer stands to be a safe manner of wintering bees. Dysentery and long confinement bees. Dysentery and long have caused the loss.

A. A. DECKER.

Granger, Wis., May 5, 1881.

Bees Successfully Wintered.—I have 47 colonies left out of 49; I wintered on the summer stands, with chaff cushions in upper story. Those now left are in in upper story. Those now left are in splendid condition, being stronger than they were one year ago, and are now building up on fruit bloom. I think there has been a loss of about % of the

bees in this county.

JAS. A. NELSON.

Wyandott, Kan., May 7, 1881.

Well Done.—I have lost but 2 colonies out of 75; this is my first loss in wintering for 5 years. One starved and one had the dysentery. About 34 of the bees in this locality are dead. I will one nad the dysentery. About 24 of the bees in this locality are dead. I will send you a small crafe of my foundation, which I want you to test by the side of the Dunham; I have no fear of the result.

D. S. GIVEN.

Hoopeston, Ill., May 9, 1881.

[As soon as convenient after it comes we will give it a fair trial and report the results in the BEE JOURNAL.-ED.]

No Loss in Winter.—This has been a very hard winter on bees; about ¾ are dead in this vicinity. I wintered 10 colonies in the yard and 30 in the cellar. and only lost one, which was caused by my closing the entrance of the hive and rom the cellar. Thomas Heaton.

Moore's Hill, Ind., May 3, 1881.

Bees that are Stingless.—Will bees puncture grapes, is a question that has been discussed considerably of late. Now, as regards my 25 colonies of bees, Now, as regards my 25 combes of oces, I can put that question at rest—they will not puncture grapes, neither will they sting. In the language of Jim Fisk, "they are gone where the woodbine twineth." The majority of the bees that have passed through the winter in this vicinity are in the old box hives. I will make it as light as possible by averaging it. Last season was a poor year and I had plenty of bees; this year I have no bees and there is a

good prospect for honey.
E. F. CASSELL.
Illinois City, Ill., May 2, 1881.

Out of the Woods.—My bees have wintered well. I put 166 colonies in the cellar last fall and now have 147 in good condition, and am out of the woods, for the fruit blossoms are just coming out. I use the 8-frame Langstroth hive.

J. F. SPAULDING. Charles City, Iowa, May 10, 1881.

No loss without some small Gain .- My loss the past winter has been 42 out of 93 colonies and about ½ of those remaining are very weak in numbers; but I am not discouraged, for although my loss is severe and the prospect for a honey crop almost none at all, I am not alone in my misfortunes, and I have not alone in my mistortunes, and I have the satisfaction of knowing that the scores of colonies of black bees which surrounded my apiary and made it al-most impossible for me to get an Ital-ian queen purely fertilized, are now al-most a thing of the past. I shall now take measures to have all the bees in greach of my anjary Italianized if I have reach of my apiary Italianized if I have to do it for nothing, and there are other considerations which confribute to lighten the load of my woes. I winter on the summer stands packed in chaff.

and every one on the south end of a row and every one of several scattered over and every one of several scattered over the yard and fully exposed to the sun are in good condition. Those in the rows starved with an abundance of honey in their hives.

GEO. M. PIPER.

Chillicothe, Ill., May 2, 1881.

Wintered Successfully.—I put 23 colonies of bees in my cellar on Nov. II and took them out April 18, all in good condition. You could not have told that took them out April 18, an in good condition. You could not have told that they had been confined at all; all had either eggs or brood; they have not dwindled any other than those which die a natural death, which in some hives has apparently not exceeded the number hatched. As 1 have wintered successfully I wish to summer as well; please tell me how to prepare them to move them 4 miles over a rough, hilly road, to a small belt of basswood. The hives are 2-story simplicity, Langstroth road, to a small belt of basswood. The hives are 2-story simplicity, Langstroth frame, and both stories as full of bees as 1 can get them? In looking over my bees to-day I found capped drone brood in 3 or 4 colonies. I have been around among the farmers lately, buying combs to melt into wax for foundation, and find the mortality of bees as follows: Visited and heard direct from 15 bee-keepers with a total of about 114 colonies that they attempted to winter. colonies that they attempted to winter, of which number only 18 or 19 are now living, and several of those are weak.

I have also heard from several experienced apiarists, who have lost from 16 to 36.

JAMES NIPE. Spring Prairie, Wis., May 7, 1881.

(In early morning, while cool, put a bottom strip in the hive with notches for bottoms of frames, or slip down strips to prevent frames from shaking; then tack down ends of frames. In the evening put wire cloth or mosquito netting over the portico, and move them at night, so as to keep them confined as short a time as possible. Care must be taken that that they do not get excited and melt down the combs.-ED.]

My Bees in Good Condition .- I put 17 colonies into the cellar last fall and had 2 die, they were queenless. I have 15 good strong colonies left, for which I am satistied. They were confined 148 days. I use the Doolittle hive and pack as he does. It has been a very hard winter for bees; I think about 2 that they are the same between the same below the same below the same below the same below the same the same below the same the sam whiter for oees; 1 think about 73 that were in this county have died; those that were put in cellars wintered best. You can put me down for a life subscriber for the BEE JOURNAL.

CHARLIE W. BRADISH.

Glensdale, N. Y., April 30, 1881.

How I Packed in Chaff.—I put into winter colonies 72 colonies, and lost one winter colonies 72 colonies, and lost one by dysentery and 5 starved. I doubled up some weak ones and now have 58. I have a separate stand for each hive made by taking a 2x4 scantling 2 feet 2 inches in length, and 4x8 the same length, nailing on boards 3 feet long, length, nailing on boards 3 feet long, putting the wide piece behind, elevates the stand 4 inches, on which I place the hive for the summer; I use the Langstroth hive. In the fall, as soon as the honey flow ceases, and before it gets cold, I take a box 2 feet high that will fit the stand; it is without bottom or top, the foundation answering for a bottom: I place it over out bottom of top, the foundation answering for a bottom; I place it over the hive, leaving 4 inches space for chaff. I then put a 6 inch block under the back of the hive; that leaves a chance for packing under the live. Taking off the honey boards I put on a box that will fit the hive; the box is 4 inches deep with wire cloth on the bottom, putting in burlaps to keep the litter from the bees, then filling with cut straw. The cap above the box is filled with straw. I have a hole through the cap on each side covered with wire cloth to keep out the mice and let the foul air pass off. In the front I have a spout 10 inches long, made by nailing 4 pieces of 1 inch board, 4 inches wide, leaving an entrance 2x4 for the bees to

26 lbs.; others that were soiled consumed in like manner; those that came through all right consumed the least oney. GEO. WICKWIRE. Weston's Mills, N. Y., May 6, 1881.

The Winter and Bees in Maine. - After The Winter and Bees in Maine.—After reading so much about disaster among bees elsewhere it is encouraging to know that in this part of Maine we have done well. My bees wintered well and are in good condition. I have heard of but one colony here that is lost, and that had no eare or protection. It has not been colder than 8- below zero here; cold weather commenced zero here; cold weather commenced early and continued until about Febru-ary 25, when we had a rain, which, with the warm sun, took off the snow, and gave the bees a cleansing flight. like the chaff hive, either for wintering on the summer stands or in the cellar; on the summer stands of ... The Bee it keeps them dry and warm. The Bee is a welcome visitor—the JOURNAL is a welcome visitor—tl more I read it the better I like it. A. F. MILLER.

Camden, Maine, May 6, 1881.

Only 7 Saved out of 140.—1 commenced the season of 1880 with 93 colomenced the season of 1550 with 35 color-nies; the honey season was late, none-being stored until about June 20; I in-creased to 140 by the "shaking off" process, making I new colony from 2 old ones, and a few natural swarms that came out from those very strong, atthough I examined often and dealthough I examined often and destroyed the queen cells to prevent increase. I extracted all the white clover crease. I extracted all the white clover and basswood honey; all honey left for wintering was gathered after July 25. All were very strong in numbers and they soon filled up the hives, so that I had to extract the fall honey from some. Our first frost was on Aug. 17, which nipped buckwheat and fall blossoms and checked the flow of honey; still they gathered more than they used. On Oct. 16 the weather became cold and af-Oct. 16 the weather became cold and after that the bees did not fly. I examined them on Feb. 1 and found 3 dead, and many were getting very uneasy; by March 1 only 88 answered to the usual rap; on Mar. 6, down to 62; on the 15th, to 55; these then had a flight, but many were lost on the snow, and by the end of the month only 42 remained. The first week of April was very cold and unfavorable, and by the 10th only 12 remained, and to-day only 7 survive out of the 140; a few bees are left in some of the hives, but they do not count any of the 140; a tew bees are left in some of the hives, but they do not count any-thing; all had plenty of honey. Now 4 think all, or nearly all my bees had as much unsealed and late gathered poor honey as they would consume for a month after they were confined to the hive, and if they could have had a flight early in November all would have been well. I winter on the summer stands and in different hives, some being double and having 4 inches of sawdust all around them; the bees in some of these double hives were the first that died.
GEO. GARLIEK.

Warsaw, Out., May 6, 1881.

Abnormal Swarming.—The Weekly BEE JOURNAL comes regularly to hand. I am well pleased with it and would not be without it for twice its cost. I like to read the articles of Messrs. Doolittle and Heddon. I think they are both earnest in what they say, and hope they will continue from time to time to furnish us with their interesttime to turnish as with their interesting articles on bee-ology. While working close to one of my black colonies I noticed a small cluster of bees on a piece of plank lying in front of the hive directly under the alighting-board. I was a fittle curious to see what they were doing, and was astonished to find the queen; she was so queet that at first I thought she was dead, but she was alive and the bees were in a circle around her caressing her and offering her food. On opening the live to replace the queen I found everything all quiet, but immediately on dropping the

this manner? The five contained only about 4 or 5 frames of bees and brood. I had them closed up with division boards. The queen had a clipped wing, otherwise she might have left for good. W. T. CLARY. Claryville, Ky., May 9, 1881.

[It was an attempt at abnormal swarming. Those bees which you found in the hive had undoubtedly come out with her, but when she dropped to the ground lost sight of her and returned to commence the work of rearing a queen. Of course they were loth to accept her till after smoking.-Ep.1

Bee-Keeping in Missonri.-I have 100 hives-56 containing bees in good condition, the rest empty, ready for the swarming season. I prefer natural swarming for increase. My hives are 10 inches above the ground, and 10 feet apart each way, located in a locust grove of 60 trees 5 or 6 inches through, tops about 12 feet high; 3 of these trees were struck by lightning; I do not know whether it is the electricity in the bees, or the locust trees that attract the lightning; or either of them. There is him tiple a local trees that attract the lightning; or either of them. is heavy timber close by. I have lost 4 colonies; they were moved to another part of the yard soon after their first flight. There has been great mortality among the bees in this county during the tract within the part with the part of the part of the part within the pa among the bees in this county during the past winter, but principally with those in box hives or log gums. Great ignorance prevails here among those keeping bees; they will yet be compelled to discard these "old fogy" ideas, sooner or later, for scientific advancement is rapidly gaining ground west of the Mississippi.

Benton, Mo. J. SMITH HEAD.

Plenty of Honey but few Bees.—It is hard to make a report when our efforts have not been successful. I had 70 colonies last fall, now have 9 or 10, and most of them are weak; they all had plenty of honey, but long confinement did it. Our first natural pollen came April 15. I think <sup>2</sup><sub>3</sub> of the bees in this vicinity are dead. I shall try again but will have to go slow: I shall thus a few will have to go slow; I shall buy a few queens from those who don't raise dollar queens. It may be profitable to dol-lar queen breeders to rear them, but it is loss to the purchasers. for the men who are opposing cheap queens, glucosed honey, and other frauds which are doing great injury to bees and their true friends. I like the BEE JOURNAL, and want to see the subscription list large enough to sustain it well.

D. G. PARKER.

St. Joseph, Mo., April 21, 1881.

No Loss in Wintering. - I finished putting out my 240 colonies on April 25. They are in prime condition with only aney are in prime condition with only 8 dead ones (4 starved and 4 destroyed by mice). Two of my neighbors wintered 100 and 105, respectively, without losing any. 1 like a solid cold winter for hows

De Kalb, N. Y., May 2, 1881.

What is Required.—The article on page 99, by A. Webster, is worthy of careful consideration, and if a hive-frame or system of bee-management frame or system of bee-management can be established in exact accordance with the honey bee, it will be a grand success. Let us have a hive in which we can control the colony, be it small or large; in which we can produce extracted or comb honey in the best possible shape for market; that the honey sible shape for market; that the honey can be taken from the hive without disturbing the brood nest; that the frames can be lifted out without sticking or scraping; that swarming may be encouraged or prevented, as desired; that bees can be safely wintered on the summer stands on the smallest possible amount of honey, without chaff, saw-

entrance as desired. The cover of the box should be made to keep perfectly dry. By wintering in this way my bees come out clean. I weighed all of my hives last fall to ascertain the amount of honey; they had from 13 to 28 lbs.; the one that died of dysentery consumed in 18 to 18 lbs.; others that were soiled consumed to the one that died of dysentery consumed in 18 manner? The hive entained only about 4 or 5 frames of hees and brood in the same of honey; those that came about 4 or 5 frames of hees and brood in the old lady apparently following her hive that is cheap and simple, and the mercury marks 20 below zero; a hive that is cheap and simple, and the mercury marks 20 below zero; a brook the mer sultry days of July and August, and one in which they can keep warm when the merenry marks 20 below zero; a hive that is cheap and simple, and that can be made with a saw and hammer. Let us have no hobbies to ride or scissors to grind. Such a hive will be universally adopted. Movable frame hives have been in use long enough for all their good qualities to be known, and the size of frame best adapted for summer and winter use. Let the entomolthe size of frame best adapted for simmer and winter use. Let the entomologist, the honey producer, the queen breeder, and the hive maker reason together, and the result ought to be what is wanted.

J. S. DUNCAN.

Browning, Mo., April 18, 1881.

Wintered in the Cellar.—I put 119 colonies in the cellar Nov. 15, and took out alive 107 April 16. I left 6 out for want of room, all of which died, of course. Those taken from the cellar were put on the summer stands between 7 and 9 a.m., without reference to their former location. The caps were left off till towards night and put on while the bees were out; the result was a dozen colonies went in with others (all had plenty nes went in with others (an find pienty of honey), and now, after robbing, etc., I have 89 colonies in the best of condition. My loss was wholly the result of carelessness. The cellar was 8x16, partitioned off from the family cellar by sheeting paper. But a few nights in the winter that the outer door was not opened to cool the atmosphere. In March I made a "blower" so that I could cool them at any time. My bees consumed from 8 to 10 lbs. of honey on the average in the 5 months. I have had good colonies winter well on 4 lbs.; some used 18, but generally 6 to 10. some used 18, but generally 6 to 10. About 78 of the bees are probably dead in this locality. Will Hiram Roop please say why he would rather have 100 colonies wintered out of-doors than 150 in the cellar? Do queens go out with the bees on their first flight? How can I keep a queen for future use?
Thos Tracy.

Nashua Iowa, May 1, 1881.

[Queens do not go out with the bees on their first flight. If your bees are allowed to swarm naturally, you cannot keep the queen without clippingg one wing. By dividing, you can save her by removing to the new colony, or depleting the colony in which she remains.—Ed.]

Good Prospect. - The winter has passed and so have many of the bees. The past 2 seasons were a total failure. There are but 6 colonies of black bees left in this vicinity; the Italians have held their own better. I doubled down last fall from 95 to 70 colonies; wintered them in a house apiary; put them in the house Nov. 14 and took them out March 20; I found 4 weak colonies, all dead now; 3 queenless, 2 with drone laying aneans. laying queens, and several weak in numbers. I doubled down to 56 which are all in fair condition. Fruit trees are beginning to bloom; if we have fair weather now I think we shall have a fair crop of honey, for white clover promises to be abundant. When I read the reports in the JOURNAL I feel that I have reason to be thankful. I am now engaged in other business, so if it now engaged in other business, so it it is a good season [ shall have all I can attend to, and if it is a poor season I have enough. J. M. VALENTINE. Carlinville, Ill., May 4, 1881.

Loss One in a Thousand.—Our terrible winter is nearly ended. It has been more fatal to bees than any for many years. Nearly all who had a dozen or so of colonies have lost all. Judging from the reports in the Journal those who wintered out-of-doors will be trying something different, and I am rather glad that they have had something to open their eyes. It may be all right to winter out in the cold, but to me it has the appearance of barbarism, and I cannot see how anyone with the least kindly feeling for the bee can sleep on those cold dreary nights, when they must know their bees are having a death struggle with the cold. If the losses shall teach a lesson to queens on top of the frames the bees dust, lime, or any other packing (all such men, then all the bees have not attacked her as they would a stranger, such prove a deliciency in the hive); that died in vain. Another reason why peofile immediately ran and lit my smoker the bees can keep cool in during the hot ple should house bees is, it pays; much before using.—Ed.]

less honey is consumed in a warm room than out in the storm. The walls of than out in the storm. The walls of my bee house are 26 inches thick, filled with tan bark and sawdust, with double doors and ventilators—ground is covered several inches with dry sawdust, to take the moisture. The bees were kept in 160 days this winter with no signs of dysentery. I took about 950 signs of dysentery. I took about 950 colonies out of my old apiary April 9; all were alive, though one had but the queen and a very tew bees, and soon perished. Of about 44 colonies bought last fall in bad condition, and kept in another room, I lost 7. My bees are stronger than ever. P. T. GRIFFITH. Danby, Vt., April 19, ISSL

Cellar Wintering.—For the past 5 years this has been always satisfactory with me, although loss from dwindling always averages from 20 to 30 per cent. I have now 50 good colonies out of 70 last fall. J. C. Thom, M. D. Streetsville, Ont., May 10, 1881.

A Loss of One-third.—About Nov. 15 1 packed with chaff 30 strong colonies on the summer stands—part were in hanging-frames and part in Quinby's standing frames. I have 20 now. 1 see no choice between the different styles of frames for wintering. I also had 12 nuclei, each with from 2 to 4 frames and about a mart, of bees; of the 3 1 about a quart of bees; of the 3 I packed in chalf on the summer stands there are but 2 weak ones left; the oththere are but 2 weak ones left; the oun-ers I put in the cellar without packing —2 or 3 in a hive, with division boards between. On April 15 I took them out and 5 were alive, but 2 dwindled away. The other 3, I think, will build up. M cellar was damp. ROBERT DOWNS. Naugatuck, Conn., May 6, 1881.

Experienced Bee-Beepers.—While a large percentage of the bees in this locality are dead, experienced bee-keepers who had their bees in cellars have lost but few, and their bees are now doing well.

J. Dewar. Tiverton, Ont., May 10, 1881.

Good. - From 90 colonies placed in the tology - From 90 colomes placed in the cellar Nov. 12 I have 82 in fair condition. I estimate the loss in this locality at 25 per cent. W. H. Fletcher. Sauk Rapids, Minn., May 2, 1881.

Heavy Loss .- Mr. Knowles and I had about 45 colonies each last fall; now he has 5 and 1 (a. All were packed in chaff. Nearly all the bees in this locality are dead.

R. Walton. Industry, Pa., May 7, 1881.

Lost 2 ont of 7. - I have lost 2 out of 7 colonies in wintering; the cold came on last fall before I was prepared for it, and I left them unprotected; the other and 1 left them improtected; the other 5 have now sealed brood and I hope are all right. Can 1 hive my new swarms on those old combs this spring? they have each about 5 lbs. of honey in the hive and I have no extractor. A neighbor of mine has half a dozen colonies in law hives: the hack of the hive is in box hives; the back of the hive is hinged and the brood chamber closed in with a pane of glass; about the first of March when I saw them I found one of them with the glass out of the brood chamber, and the back of the hive so swelled and warped that it would not close within 6 inches, leaving one side almost wholly exposed to the weather. I was told that they had been so all winter, and yet that hive contained the best colony in the lot, and on April I the bees were carrying in pollen lively. The combs were as bright and fresh as when first made. In the surplus chamber were 2 large boxes that the owner did not done to the surplus characters to the surplus control of the surplus con did not dare to remove, on account of the bees flying out front and back. Perhaps they kept that warm enough to live in during the winter, and so were not obliged to go on the other edge of the combs for food. I am of the opinion that you "builded better than you knew" when you made the JOURNAL a Weekly; it has already become a necessity, and the bee-keepers of this country, as well as Europe, appreciate it.

C. W. Dow.

Lynn, Mass., April 18, 1881. [Yes; those combs are as good as so much gold. Let them dry thoroughly

#### SPECIAL NOTICES.

Single copies of the Journal are sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

The Volume of the Bee Jour-NAL for 1880, bound in stiff paper covers, will be sent by mail, for \$1.50.

When changing a postoffice address, mention the old address as well as the new one.

We have prepared Ribbon Badges for bee-keepers, on which are printed a large bee in gold. Price 10 cents each, or \$8.00 per hundred.

Notices and advertisements intended for the Weekly BEE JOURNAL must reach this office by Friday of the week previous.

We can supply but a few more of the back numbers to new subscribers. If any want them, they must be sent for

A Safe and Sure Means of restoring the youthful color of the hair is furnished by Parker's Hair Balsam, which is deservedly popular from its superior clean-

Constitutions and By-Laws for local Associations \$2 per 100. The name of the Association printed in the blanks for 50 cents extra.

BEE JOURNAL will be sent free to any names that may be sent in. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office. names to this office.

The date following the name on the wrapper label of this paper indicates the time to which you have paid. In making remittances, always send by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, and local checks, are not taken by the banks in this city except at a discount of 25c., to pay expense of collecting them.

Premiums.—For a club of 2, weekly we will give a copy of "Bee-Culture;" for a club of 5, weekly, we will give a copy of "Cook's Manual," bound in cloth; for a club of 6, we give a copy of the Journal for a year free. Do not forget that it will pay to devote a few hours to the Bee Journal.

At the Chicago meeting of the National Society we were requested to get photographs of the leading apiarists, to photographs of the leading aparists, to sell to those who wanted them. We can now supply the following at 25 cents each: Dzierzon, the Baron of Berlepsch, and Langstroth. The likeness of Mr.Langstroth we have copied, is one furnished by his daughter, who says, "it is the only one ever taken when he was in good health and spirits." We are glad to be able to secure one of such a satisfactory nature. a satisfactory nature.

FI It would save us much trouble, if all would be particular to give their P.O. all would be particular to give their P.O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name. Many others having no Postoffice, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

Food for the Brain and Nerves that will Food for the Brain and Nerves that will invigorate the body without intoxicating, is what we need in these days of rush and worry. Parker's Ginger Tonic restores the vital energies, soothes the nerves and brings good health quicker than anything you can use.—Tribaae, See other column.

#### Honey and Beeswax Market.

BUYERS' QUOTATIONS

#### CHICAGO.

CHICAGO.

HONEY The market is plentifully supplied with honey, and sales are slow at weak, easy prices. Quotable at 155.15e, for strictly choice white comb in 1 and 2 lb.boxes; at 10-612e, for compon dark-colored and broken lots. Extracted, 7500.25e; dark, 150017e.
BEESWAX. = Choice yellow, 20025e; dark, 150017e.

#### NEW YORK.

HONEY.—Best white comb honey, small neat ackages, 14 offic.; dark 11 offic; hrge boxes 2c, less,— Vilte extracted, 90-10c; dark, 70-8c, BEESWAX.—Prime quality, 200-25c.

#### CINCINNATI.

HONEY.—The market for extracted clover honey good, at 86/10c. Comb honey is of slow sale at 16c. egood, at 8@10c. Comb or the best. BEESWAX-18@22c. C. F. MUTH.

#### SAN FRANCISCO.

HONEY—A general disposition to clean up stocks of extracted is enabling buyers to obtain concessions on previous asking rates. Late rains have materially increased the bee food in the leading honey districts, and there are now good prospects of a very fair crop. We quote white comb. 12a/14c; dark to go d, 9a/14c. Extracted, choice to extra white, 534(6)(3)(c); dark and candied, 4a/3bc.

andied, 405/5c.
BEESWAX—250/24c., as to color.
STEARNS & SMITH, 423 Front Street.
Sao Francisco, Cal., April 30, 1881.

#### CLUBBING LIST.

We supply the Weekly American Bee Journal and any of the following periodicals, for 1881, at the prices quoted in the last column of figures. The first column gives the regular price of both:

The Weekly Bee Journal (T. G. Newman) 23 01 and Gleanings in Bee-Culture (A.I.Root) 3 (0, 2.75 Bee-Keepers' Magazine (A.I.Kinin), 3 00, 2.75 Bee-Keepers' Achange (J.I.Nellis), 2 15, 2.50 Bee-Keepers' Instruction (J.I.Nellis), 2 15, 2.50 Bee-Keepers' Instruction (J.I.Nellis), 2 15, 2.50 Bee-Keepers' Instruction (J.I.Nellis), 2 16, 2.55 Bee-Keepers' Instruction (J.I.I.II), 2 16, 2.55 Bee-Keepers' Ginde (A.I.J.III), 3 16, 3 17, 3 18, 3 1

### Black or Hybrid Bees Wanted

ALFRED II. AEAM AN 972 West Madison street, CHICAGO 11.L.

I HAVE NOW OVER

#### 300 COLONIES

ITALIAN QUEENS,

## Nuclei and Full Colonies,

are now being booked and will be filled in rotation as received, commencing about June 1st., at the following prices:

frama 3	Jantone	per na	Tostoc	en13 5 L Queen 5 0
T CONTROL	- acieus	, witti	T CHICK	Succession 9 0
				5.5
**	8.4	**		6 (
**	14	4.6	**	6 5
ull Celo	ntes, er	aeh		

I will use all possible care in preparing the above for shipment, but cannot guarantee safe arrival, ex-cept on queens any distance less than 1,(xx) miles.

ALSO

### 100 COLONIES

### BLACK AND HYBRID BEES,

#### Also, 200 Colonies of Native Bees,

in Box Hives, delivered on Mississippi River Steamboat any time after April 15th, in lots of 10 or more, at \$6 00 each.

IF The Colonies of Hybrids and Natives are very strong in bees reared this spring, and combs well billed with brood. They can be transferred or divided by May 1st, and increased in time for white clover and biaswood surplus.

ALFRED II. NEWMAN,

### DON'T BUY SUPPLIES

read my new price list for the spring is cheaper now, so I can sell you at the ab foundation cheap, and made on the and new Yandervoort machine. Italian queens, Bees, Hives, Sections, etc. ree to all.

J. V. CALDWELL,

### THE Headquarters in the South

for ITALIAN and CYPRIAN BEES and QUFENS, FOUNDATION and APLARIAN SUPPLIES. If you want Early Queens, from stock selected for their most desirable qualities, or want imported Queens, Dunham Foundation in large or small quantities, or Aplarian supplies of any kind, at moderate prices, send for my new Hilbstrated Price List. #### N. W. Wisconsin and E. Minnesota.

Pursnant to call, the bee-keepers of Northwestern Wisconsin and Eastern Minnesota met in convention at La-Crosse, Wis., on Tuesday, May 10, 1881, with Vice President E. Markle in the

The number of colonies lost last winter was 403, and from the different opinions expressed, it was the general impression that bees will winter best in

a cellar.
L. H. Pammel read a paper on the

L. H. Palliner read a paper on the "Progress of Bee-Keeping."
W. Lossing followed with an essay on "Wintering Bees."
Mr. Salzer did not know what was the

Mr. Salzer did not know what was the cause of losing so many bees last winter, but thought it was impossible to lose so many unless they froze.

Mr. Markle said those who had wintered in cellars had lost but few compared with the loss on summer stands. Most of those lost on the summer stands were smothered. were smothered.

Mr. L. S. Soules said that as bees dwindled so much in winter, bee-keepers would have to sell their bees by the pound.

following is the address of M

A. Gill, Viola, Richland Co., Wis.:
In giving my ideas on the many vital questions you have so wisely chosen for questions you have so wisely chosen for discussion at this convention, I do not expect or claim to offer any rule which is infallible. I do not wish to array myself against the mighty march of progress, that is daily evolving new and valuable lessons in this, our chosen science; all that I can hope for is to be privileged to drop, perchance, some single thought, whereby some member of the fraternity may be benefitted. I will therefore comment briefly upon will therefore comment briefly upon and review the several questions be-

fore this convention.

1. Bees that are each and every one

protecting their hive against the moth, that bear their loads of honey right up to the very entrance instead of gyrat-ing in front of the hive, that have many ing in front of the hive, that have many ragged winged veterans among the working force, which denotes hardiness and longevity (the latter characteristic I regard of paramount importance)—such bees I consider as possessed of superiority as between colonies of the same race and bees of whatever race, possessing the foregoing requisites, I look monas superior. look upon as superior.

2. I claim that in any locality north of parallel 40, cellar wintering is preferable from the fact that if any protecseems the most perfect and entire pro-tection is the best, and we should endeavor to preserve, as nearly as possi-ble, that temperature which will keep the colony in its normal condition; a condition which in my mind cannot be secured on the summer stand (no matter how thorough and complete in its details is the method of packing adopted) with the mercury ranging as it has for the last 60 days in our State; I would have it understood, in all that the terms imply, that a cellar should be perfectly quiet, pure and dry, and all light excluded.
3. With the above conditions ful-

filled, npward ventilation more than a quilt would give, I think needless, but if on the summer stands, direct up-ward ventilation or plenty of absorbent material I think very necessary.

4. Attendant upon and owing to the foregoing method of winter protection, I consider from 12 to 14 lbs. of good honey sufficient to carry any colony from the 20th of Nov. until the 1st of April, but if on the summer stands, would consider 25 lbs. as no more than an ample store for the same length of time; after that time, each would con-sume comparatively the same amount.

5. The smallest quantity Lever knew to be consumed was 5 lbs. This was in the winter of 1879-80, from Nov. 20 to March 20. This was by a colony of Itallans of my strain of small eaters, which I consider a very desirable trait, and one as distinct as that of beauty, docility, or honey gathering, and which I firmly believe can be induced by selection and breeding as much as any other quality. For who has not noticed in families of bees (as well as of mankind) that some will live and thrive—by their habits of economy and frugality—upon what others would waste by their gormandizing and profligate habits.

The great mistake of beginners is etting too many bees before acquiring a thorough knowledge of the business; another mistake is often made by al-lowing a too rapid increase which will (to the novice) invariably result in dis-

aster.
7. Having some experimental knowledge I would say to the beginner, be cautious; first study well some standard work, and by no means think of doing without a bee-keeper's periodical of recognized merit. Next buy 2 or 3 col-onies of bees (not more), and buy none but the best, adopt some good standard hive and get all the honey you can and but little increase until you find out whether or not you are a bee-keeper.

for pure honey; have ever made it a practice to allow my bees ample stores for even an emergency while I take what remains. I endeavor to place the honey in such shape in the hive (for this the Gallup frame answers the purpose best) that the late honey, such as buckwheat, golden rod, aster, etc., may be consumed first and while the bees are be consumed first and while the bees are in their most healthy condition, while the basswood and clover will come in toward spring and serve as a change of diet or alterative, which is of considerable importance after their long confine-

ment.

9. On the best method of swarming different for Wisconsin there are many different opinions and many phases of the quesopinions and many phases of the question, and the matter must necessarily be governed by circumstances. For the specialist with but one apiary I would advise well controlled natural swarming, while if he should own an apiary away from home nucleus swarming might be practiced to great advantage by building up nuclei and interchanging between the locations, thus avoiding the difficulty so often met with of a return to the parent colony. But in the case of many (myself included) who are engaged in a joint business, farming and bee-keeping, it is impossible to give the latter one's whole attention, and for such, well conducted artificial swarming is the most desirable.

10. I would not advise dividing, only

10. I would not advise dividing, only in exceptional instances, before the clover season, as it is liable to thwart the best chances for the basswood yield in those sections where it is the chief source of surplus. In many parts of our State white clover is sadly wanting was proported with the older States but as compared with the older States, we look forward with hope to the time when our hill-slopes, valleys, pasture lands and waste lands shall bear this beautiful and useful plant in bounteous profusion.

11. In regard to melting up old combs for foundation, I think it should not be practiced with straight worker comb. have sometimes thought that for the different uses of broad combs those old stiff ones were the best, however their ntility is certainly of longer duration

than many suppose.

12. The use of division boards as a means of enhancing our surplus is to me of great importance, and not only its early use in the hive proper, but its use in the super in getting the bees started where trames are used that hold 2 tiers of sections or for starting on 2 or 3 combs for the extractor, throwing back the mat or quilt and putting in the follower, and spreading the comb as fast as wanted until the entire super is occupied, when everything around the hive will soon be on a boom.

I do not think basswood injured; it being a forest tree and indigenous, why should it kill any more than the bloom of the maple or any of the different varieties of salix.

The following questions were taken om the question box:
What is the origin of the Italian bee?

Are bees taxable property; and if so, how much per colony?

now much per colony?
In answering the first question, Mr. Soules said that the Rev. Mr. Langstroth, Mr. Jones and others had come to the conclusion that the Italian bee 1. Bees that are each and every one armed sentinels against every discourtion I have only to say that I never had teous intrusion, that are vigorous in occasion to winter on any substitute bee.

8. In commenting upon this questional to the conclusion that the Italian bee was a hybrid of the Cyprian and black bee.

Mr. Pammel said the Italian bee was

an offspring of the Cyprian, since its shape and general structure indicate it.

Mr. Lossing said they were a distinct race, as the saddle found on the Cyprian was not to be found on the Italian.

was not to be found on the Italian.

Mr. Pammel said that as a proof of his statement, every close observer had noticed the great difference in our homebred Italians and those imported. A few years more and we will have a distinct race, if the rule of selection of the best and "survival of the fittest" be practiced.

practiced.

Mr. Markle thought Mr. Pammel was laboring under a great mistake. In regard to the second question, he thought it an insult to tax bees, since he could not tell how long he could own them, or whether they would ever give him a

profit.
L. S. Soules said he did not know how they could be taxed, since they are not personal property.

personal property.

Mr. Lossing thought it unjust that some bee-keepers were taxed while others were not; if they are taxable property he would be willing to pay.

Mr. Salzer said they should be taxed, since they are personal property, just as are the horse and cow, and the profits reaped therefrom are just as large.

Mr. Markle. If they are taxable, why

Mr. Markle. If they are taxable, why not tax the trout in a man's pond; it would be equally absurd.

Mr. Pannnel. As bees are in every sense of the word personal property, they should be taxed, one and all.

Mr. Jaques said as his bees had been taxed with a thorn had been taxed.

taxed while others had not, he looked the point up and found that bees, ac-cording to a general law, are not taxable property.

R. A. Morgan, Arcadia, Wis., in reply to the question "does it pay to melt up old combs and use foundation," said: I say it does. But what I may say, or what the best of bee-keepers may say, is not now believed unless proved by actual demonstration; hence I will give the following formula, which I think is not overdrayn.

not overdrawn:
1. I find about 15 per cent. of all old combs moldy and about 5 per cent. cracked or twisted out of shape.

2. We will suppose that the cost of filling a hive with new foundation is 50 cents, and that honey is worth 10 cents a pound, we lose what is equal to one good day's work for the colony or (2½) lbs. of honey) 25 cents to say the least, which is 50 per cent. of the foundation by using old combs instead of foundation; the cleaning of the combs is worth at least 5 per cent. of the founda-

3. The old combs to melt up are worth 25 per cent. of the cost of foundation, making in all 100 per cent. or the whole cost of foundation. This does not take into account the waste and expense of keeping combs over, the number of bees killed or disgusted by having old combs put into the hive or the increase in wax that the bees make by building out the foundation, nor the time lost by the queen not accepting old as readily as new, and sometimes not

t all. But while we bear this in mind we must not think that there is no profit in using old combs; on the contrary, old combs may be used with great profit, but comb foundation with still greater how I arrived at these figures suffice to say that I arrived at them by actual experiments, which experiments are subject to conditions, such as climate, weather, kind of comb used, etc.

I think it but just to say that to my knowledge the Dunham foundation is the best in use.

The Convention adjourned to meet pursuant to the call of the President.

JAMES MANCHESTER, Pres.

L. H. PAMMEL, JR., Sec.

#### Eastern New York Convention.

This convention was held at the Schoharie Court House, N. Y., May 10 and 11, 1881.

President A. Snyder being absent, at President A. Snyder being absent, at 2 p. m. the meeting was called to order by the Secretary. W. L. Tennant was elected President pro tem. Mr. Tennant then delivered a short address, full of practical interest to bee-keepers.
W. D. Wright, N. D. West, I. Markle, Geo. Van Wie, and M. Snyder were appointed a committee to select questions for discussion.

Question: "Is it necessary to give bees upward ventilation in winter, if in frame hives in cellars with temperature

frame hives in cellars with temperature at 45?" The general opinion was in at 45?" The general opinion was in favor of wintering in cellars with upward ventilation, but not enough to cause a draught through the hive; and that bees should occupy 7 spaces of comb for successful wintering.

The evening session convened at 7 p. m., and had an interesting meeting full of interest to bee-keepers.

#### SECOND DAY.

The meeting was called to order by President Snyder, at 9 a. m. The following were elected officers for the coming year:

coming year:
President, W. D. Wright; Vice-President, M. Snyder; Secretary, N. D. West; Treasurer, W. L. Tennant.
The next meeting will be held at Knowersville, Sept. 27, 1881.
It was resolved that each bee-keeper

present should in the afternoon hand in their reports for the last year, but they

failed to do so.

The Secretary read the following from J. H. Nellis, Canajoharie, N. Y.:

The past severe winter has doubtless made sad havoc in many apiaries and, it may be has well nigh discouraged many. may be has well nigh discouraged many. Here the theory of "the survival of the fittest" will be exemplified, and those who possess pluck will, with the plucky bees that "pull through," make a grand success in the future. Study hard to learn the causes of loss, for we all must realize that if the losses of winter can be avoided we can make bee-enfure profitable, and we hold that nowhere can more accurate information be obtained than from a careful comparison of facts, circumstances and comparison of facts, circumstances and

comparison of facts, circumstances and conditions, especially between the extremes of success and failure, which honest men seeking for truth can elucidate at our Bee-keepers' Conventions.

Compared with the matter of successful wintering, all other points of discussion fall into insignificance, unless perhaps the matter of creating a solid basis for the honey market. This will be have breaching in the future in 3 ways for the honey market. This will be done largely in the future in 3 ways, viz.: Create and maintain a home demand, avoiding as much as possible the crowding of your product upon a centralized market where it is handled by commission merchants. True, you will learn of a few getting fancy prices for their crops when so handled, but realtheir crops when so handled, but lear-ize that favorable conditions, as being put on the market very curly, or being of gilt edge quality, or there may be a little favoritism shown, or is it not possible that a few lots are accounted for at fancy prices in order to allure con-signments? Beware of all these we

say. Secondly. say.
Secondly. Be sure your packages are of popular size and of line appearance for box honey.
Thirdly. Extracted honey can and will find large sales at fair prices, put

in themselves, which latter quality will make a success of any article or man when possessed.... J. H. Nellis, A vote of thanks to Mr. Nellis for his able essay was unanimously carried. Question: "What are the requisites for successful wintering?" This was hardward by the follower. Please of the control o

for successful wintering?" This was answered by all as follows: Plenty of young bees and honey, also a good cellar or frost-proof repository, and the bees should be put in before there is frost in the hives.

Question: "Do bees need water while wintering in the gellar, if so, is the

wintering in the cellar; if so, is the condensed vapor arising from the bees sufficient, or should they be supplied with fresh water?"

Mr. Boomhower said: Bees do not med water in winter, the vapor arising to the top of the hive is sufficient and good for this supply; I have tasted of it many times and found it good and sweet. I winter in a clamp—no ventilation at the bottom of my hives; I put on a piece of factory cloth covering the whole top of the hive. I then put on the on a piece of factory cloth covering the whole top of the hive, I then put on the honey board, so as not to cover the whole top. I examine them often and if any are uneasy I shake the drops of

if any are uneasy I shake the drops of water on the honey bourd down upon the factory cloth; I sometimes sprinkle them with fresh water; they will come up and eat like pigs and be quiet. I winter very successfully.

J. G. Quinby winters his bees in box hives inverted, without water.

S. Vroman never tried water but thinks the vapor of the bees gives all the water needed; he does not disturb his bees in winter quarters; he thinks he would prefer water to honey for feeding to stimulate breeding in February.

ruary.
W. Tennant thinks bees do need W. Tennant thinks bees do need water when wintered in the cellar; he water when whitered in the cenar, he has been very successful in wintering when he used it; he said he had some box hives inverted one winter and he sprinkled water on them with his hand; they took the water freely; they kept quiet and bred in the cellar and came

out the strongest of any he ever had.
J. G. Quinby keeps his bees dry and gives a large amount of upward venti-lation. He winters best in this way and never gives them water. G. Van Veris: No water is needed. President Wright was not in favor of

giving water.

In the afterooon the meeting was called to order at 1 p. m. and the follow-

ing discussion ensued:
Question: What is the cause of the

so-called dysentery?"

The President indorsed Mr. Heddon's theory and thought it was the most

plausible as the cause of dysentery.
W. Tennant thinks G. M. Doolittle is correct; he uses his name frequently when speaking and indorses his writ-

Vroman thinks that cold is the

G. Van Veris: cold and dampness.
A. B. Simpkins: 1 believe nearly all the bees that die have the dysentery.

The following essay was read on

#### Spring Management.

experienced apiarists well know All experienced apparists were know that this is an all-important subject. All depends upon the bee-keeper after the bees are wintered to bring them through the coming spring, and he must determine whether they will be a succession as failure.

cess or a failure.

Two practical points must be considered: First, to know the exact condition of the bees; second, after knowing their condition to determine just what they require to bring them through strong and ready for business. In two what they require to bring them through strong and ready for business. In try-ing to find out their condition, see that they have plenty of sealed honey, and the main point of all, a queen—not a poor, shriveled up object, that might never be capable of doing the duties of her majesty, but one that looks as if she will be capable of doing her duty under all circumstances. If you should and a colony queenless unite it with some other weak colony, if you have any in your yard. By uniting 2 weak

But as I cannot explain in detail here in themselves, which latter quality will own use the coming winter, where, if they had united 2 of those weak colonies in the spring they would have gathered quite a surplus.

gathered quite a surplus.

The next necessary step is to keep the bees confined on as few combs as they will cover; the object of this is to keep as much heat as possible confined in the cluster for the benefit of brood-rearing. To do this remove all combs not occupied by the bees, leaving both reached heaver and apparts earths poors. sealed honey and empty combs necessary for the brood nest; put all combs taken out where it is dry, for future use. After removing all surplus combs, use. After removing all surplus combs, have two division boards manufactured out of some thin boards about 3% of an inch thick, and have them so that they will fit closely on all sides; put one on each side of your frames, thus closing up on both sides of the brood nest making it the same as if your hive was made to fit the size of your colony, thus your bees will not have any unoccupied space to consume their much needed warmth, for plenty of warmth is the success of spring management. It is also quite necessary to put some chaff on both sides of the brood nest, and, in fact, in every unoccupied space about your hive, as it will keep out the cold, bleak winds, and help to generate bleak winds, and help to generate warmth. After you have your colonies all in this condition and there are any that require feeding, I should advise some kind of top feeder, that is a feeder to be placed on top of the frames right over the broad past and feed them as over the brood nest, and feed them, as they require it, some good white sugar made in a thin syrup, or honey if you have it, and by all means do not use have it, and by all means do not use any glucose or grape sugar, as it is a nnisance and not worthy the attention of any bee-keeper. There is nothing better than good sugar or honey; it may cost you a trifle more, but you will find it the cheapest in the end. My reasons for not using grape sugar are, I have found that it hardened in the cells so that the bees would not remove it and that the bees would not remove it, and it hindered the queen in depositing her eggs in them, thus making the combs almost useless. I have known it to

cause dysentery.
You will find it necessary to examine your colonies about twice a week and as fast as the queen fills the combs with as fast as the queen fills the combs with brood and the bees can cover them, supply them with another frame of empty comb or foundation, putting it in the centre of the brood-nest, thereby increasing the size of the brood-nest and giving the queen more business in rearing. Bees I have often given two frames of empty combs in a week, and had them filled with brood. It is very precessing to use caution in doing this had them filed with brood. It is very necessary to use caution in doing this, for if you spread the brood-nest faster than the bees can fill it, you are only hindering instead of advancing them.

I find it pays to stimulate the bees in some manner in the spring, to make them breed fast. The amount of bees are what we are after at this season of the year, and the best way to bring about this result is my aim. I find it is a good plan every time going through your colonies to take a knife and break the cappings just enough to make the honey run, and the bees will gather it up and store it around the brood-nest. and set them to rearing.

A great many bee-keepers are troubled with robbing, but I find it of not much importance if you keep your colonies strong as they should be. If you have weak colonies, I should advise keeping the entrance closed so that but one bee can pass out or in at a time. one bee can pass out or in at a time, then there is no danger. Practical apiarists never have much difficulty in this matter; they generally know the condition of their colonies and what to condition of their colonies and what to do with them; but sometimes hints that have been tried as experiments and proven successful will help the most enlightened. The bee-keeper works under many disadvantages. What proves and works correct one year will not another, therefore he has to apply his knowledge as well as that of others to the peculiar circum-stances that govern the season, and we must govern our work accordingly.

expect to receive a bountiful harvest? But if we give all our energies and mind to the best mode to make our pets com-fortable, we will obtain the best results

fortable, we will obtain the as a recompense.

As I have not the space or time that I wish to give to this theme, I hope all will bear in mind the secret of beekeeping is in keeping your colonies warm and populous, and breeding as fast as possible, then you will have attained the best mode of spring management.

THEO. HAUCK.

A vote of thanks for this essay was

passed unanimously.

Question: "What style of hives and section boxes are best for securing sur-

plus honey?"
S. Vroman uses the new Quinby hive: he likes the broad frame for side sections and top-boxes used at the same time. He controls swarming so as to time. He controls swarming so as to have little or no increase; formerly he was satisfied when using the old box hive with about 25 lbs. of surplus honey, but is now hardly satisfied with 100 lbs.

per colony.

W. Tennant favors side and top boxing combined; says the Italians work in side boxes best; they are more reluctant about going up; the side boxes must be used to secure the best results. For the native bees he thinks side-boxing larger are results, and the side boxes are size because the side boxes. ing less practicable; he favors the 2 lb. prize box, says the 1 lb. is too small.

A. Stanton used top boxes only.
A. B. Simpkins uses top and side boxes combined, and thinks that the best way.

F. Boomhower has had no experience

F. Boomhower has had no experience with side boxing and wants none.
Geo. Van Wie favors and practices top and side boxing combined.
W. Tennant objects to the Langstroth frame, says it is not deep enough for successful wintering; would not use it under any circumstances; there is not death, expended for the boss to bread not the company for the boss to bread not a superior to the company for the boss to bread not be superior to the company of the compan depth enough for the bees to breed up naturally; he thinks the queen should have room to form a solid ball of brood, at least 10 inches in diameter.

It was resolved that the President appoint a Vice-President for each county

not represented.

A resolution of thanks was passed to the County Sheriff and Jailer for courtesies, and a bill of \$2 for use of Court room was ordered paid. Adjourned. N. D. West, Sec.

#### The Straw Hive of the Future.

WM. F. CLARKE.

Those who are familiar with the old edition of Quinby's "Mysteries of Bee-Keeping" (I have not the new one edi-Keeping" (I have not the new one edited by Mr. Root), will remember a prediction of his that the straw hive would yet, in time, reguln its former position in the public favor. Not the conical hive, but a straw hive of convenient shape for using movable frames. I was shape for using movable frames. I was reminded of this prediction last fall, on being shown, at one of our fairs, a straw hive coated within and without with plaster of Paris. The walls, including both straw and plaster, were about 3 inches in thickness, 2 of them being of straw, and each coat of plaster about half an inch. I was greatly interested in the hive, especially when the exhibitor told me that he was going to winter several colonies on this principle. He several colonies on this principle. He promised, at my request, to report the result. I have now his letter before me,

result. I have now his letter before me, in which he says:
"I used Sof the plastered hives and wintered that number of colonies in them and 33 in wooden hives. The plastered hives had 10 frames in them, the others (Jones' hive) had all removed but 8 (12 ance for box honey.

Thirdly. Extracted honey can and will find large sales at fair prices, put up in cheap tin packages, varying from 2 to 50 lbs, in weight. These can be shipped at cheap rates, are useful to the consumer, are not subject to breakage in shipping, and finally, are common sense.

Some other weak colony, if you have any have large way in your yard. By uniting 2 weak only nite a good colonies that govern the season, and we stances that govern the season. weak in bees. The other 7 were as strong as when put in, last fall; 3 had 5 frames of brood scaled over, and all had some brood in them. All these had old queens, the young ones were all in the wood hives; 2t out of 33 in the wood hives were dead; all the live ones were very weak, and in a bad, dirty condition. Some had used all the honey, while the plastered hives had lots to carry them to the present. The whole 7 are now, May 5, strong enough to swarm, while those in the wood hives are still quite weak." weak in bees. The other 7 were as

are still quite weak."

The calamitous experience of the season just past shows that we have not yet fully mastered the problem of win-tering. Various methods have proved yet fully mastered one promem or and tering. Various methods have proved successful under certain circumstances, while all have failed in many cases. Cellar wintering seems to have come out somewhat ahead, yet even that has not been uniformly a success. Chaff packing has disappointed not a few of its enthusiastic advocates. Possibly one reason of its failure may be its being encased in boards, one great objecting encased in boards, one great objecting encased in boards. its enthusiastic advocates. Possibly one reason of its failure may be its being encased in boards, one great objection to which is their liability to retain moisture. Mr. Quinby refers to this in his discussion of the straw hive of the future. He says: "Boards do not dispose of the moisture with sufficient rapidity." Again he says: "The moisture must be got rid of, and in no way can it be done so well as by straining it through straw." My correspondent does not say what top covering he had on his plastered hives, but the plaster would be impervious to moisture both outside and inside. With a thick straw mattress on top, the moisture would "strain through the straw," and leave the inside of the hive perfectly dry.

I shall investigate the straw-plaster hive more thoroughly, and report on it further hereafter. Meantime, now that the subject of wintering is invested with such a melancholy and general interest, I give the information which has reached me in regard to this novel mode of constructing hives. I use the

has reached me in regard to this novel mode of constructing hives. I use the term "novel" in regard to myself. It is that, both as to observation and experience, so far as I am concerned, but it may not be so to others, for there are may not be so to others, for there are those who consider that, so far as hives go, there is no longer anything new un-der the snn. Even these, however, may yet find it possible for them to get hold

of a new wrinkle.

#### The Mortality Among Bees.

O. CLUTE.

In all bee-keeping records there is no parallel to the losses of bees during the past winter. North, east and west all report that a very large part of the bees are dead. In some cases old beebees are dead. In some cases our nee-keepers, who had scores or hundreds of colonies, have lost all. Nearly every bee-keeper has suffered, but some es-cape with a loss of 25 or 30 per cent. The losses are due to several causes: 1. The season last year was a very

1. The season last year was a very poor one for honey. During fruit-bloom there was much wind and rain, hence honey was washed out of the flowers, and bees were also prevented from flying to get it. As but little honey was secured during fruit-bloom bees reared but little broad and the season of the season of

but little brood, and so were weak when the white clover season begun.

2. Last year the white clover was a very short crop. The previous winter was quite open, and the white clover was largely killed. Probably there was not 1 to 6 the usual amount: not 1-10 of the usual amount; some say not 1-20. Even if the colonies had been not 1-20. Even if the colonies had been strong they would have secured but a short crop of honey. Weak as they were the crop was doubly short.

3. Linden-bloom last year seemed to yield but little honey, and this little was largely washed away by rains during the arrange of the dowers.

the opening of the flowers.

4. The severe drouth in July and August cut off a large part of the plants that yield honey in the fall. Spanish

But winter began the first of November and there was no let up until nearly the middle of April; more than 5 months of cold weather, during which bees must consume much honey to keep up the heat of the hive, soon exhausted the small supply, and very large num-bers of bees soon had every particle of honey exten

honey eaten.
6. Some report their bees dead with plenty of honey in the hives. This may haypen in 2 ways: 1. In cold weather bees collect in a dense cluster just beneath the honey in the combs. They eat the honey above them, gradually going up the combs until they reach the top. Now, if the weather is very cold they cannot go around the edges of the combs to get at combs containing honey, and may starve with taining honey, and may starve with honey within 3 inches of them. 2. Bees do not usually void their feces in the hive; this is done outside on the wing. In very cold weather they had to eat so

live; this is done outside on the wing. In very cold weather they had to eat so much to keep up the heat that they soon became gorged and diseased. They are compelled to void in the hives, the hives become damp and filthy, the bees get what is called "bee-dysentery" or bee-cholera," and perish miserably, in spite of plenty of honey.

Probably all these 6 causes have been operative in bringing to bee-keepers the disastrous results of the winter just passed. It is quite probable, too, that there are other causes which have thus far escaped the notice of the acutest observers. Whatever the cause, bee-keepers are painfully aware of the sad fact that most, or all, of their bees have perished. They have, it may be, a few weak colonies left; they have a discouraging array of hives with no bees, from which the soiled combs send forth a sickening odor. The winter has put a check upon the bee-keeping industry from which it will take years to recover.

#### For the American Bee Journal. Introducing Queens.

ROBERT DOWNS.

There are many methods for introduc-There are many methods for introducing queens, some of which require too much imnecessary labor to suit me, and I will give my method. I do not say that my way is best, but it has proved good enough for me thus far. I have, during the past 2 years, introduced a hundred queens or more, for my neighbors and myself, without the loss of a single queen by this method:

my neighbors and myself, without the loss of a single queen, by this method: I put the queen to be introduced into the introducing cage, which is an Outman cage or one similar, with a stopper in one end, and a small, clean sponge, soaked with honey and water, in the other end, in such a way that the bees from outside cannot get to it. I then find and remove the old queen; if robbers are likely to cause trouble, I move the hive into some building, and I find by so doing that it makes the bees

by so doing that it makes the bees more docile and less apt to sting.

In the middle of the day is the best time, as then a good many of the bees are in the field and out of the way. If the weather is a little goal Lexanguage. are in the field and out of the way. In the weather is a little cool I examine the center combs first, and very often pick the queen off from the first comb that I take out; but if it is very warm, I find that she is as likely to be on the outside comb as anywhere. When the I find that she is as tikely to be on the outside comb as anywhere. When the old queen is found I put her where I know she will not get back to the hive again. If the weather is cool I spread the combs apart in the center and hang the cage in between, run a small wire through the stopper and let it rest on the frames which holds the cage in place. I formerly held the cage in place by pressing the combs against the cage, but I often found the cage on the bottom board when I opened the hive bottom board when I opened the hive to liberate the queen, which, though it may be harmless, is not so handy to get may be harmless, is not so handy to get out when ready to liberate the queen; if the weather is warm, which is generally the case, I lay the cage on the frames and, as in the first place, close up the hive and let it remain from 18 to 21 hours (not over 24 hours); then open the hive very gently, using a little smoke to drive away the bees from the cage, remove it as carefully as possible. that yield honey in the fall. Spanish needle, golden rod, asters, heartsease and buckwheat were much less abundant than usual. As a result the fall smoke to drive away the bees from the crop of honey was very light.

5. From these causes the hives were but partially stored with food for winder. If the winter had been a warm one the losses would have been heavy.

performed.

The bees will liberate the queen in a represent time and when the hive is closed and everything is quiet she has the scent of the hive and very soon begins business, like all good queens. By this method but very little time is lost in the increase of the colony. After m the increase of the colony. After removing the old queen I aim to get an-other one in her place as soon as possi-ble. To let a colony remain queenless for 6 or 8 days is needless, and then to for 6 or 8 days is needless, and then to go through a hive and cut out the queeneells I find is no looy's play. I have put in queens in this way when the bees were made so cross by robbers that I could not go near the hive without veil and gloves, and the queens were received all right, every time.

Naugatuck, Conn., May 2, 1881.

For the American Bee Journal.

#### Shall we have a General Report?

G. L. TINKER, M. D.

There will probably never be a more auspicions time to make a general report on the various causes of the great mortality of bees during the past winter. It bee-keepers are to profit in the future by our late disasters, a classified and summarized report should be made. No names of bee-keepers need be published, but the losses of colonies and those left alive can be classified and and those left alive can be classified and utilized to great advantage in promoting the science of apiculture in this country. A percentage of all losses in the different kinds of hives by the various methods of wintering can be made so that it is possible to ascertain the most successful winter hive and the

best method of preparing for winter.

The many published reports are indefinite in very important particulars, and if anyone will take them alone lars, and if anyone will take them alone and endeavor to make out a general report, it will soon be found to be impracticable. I have therefore undertaken to make out a general report by addressing a large number of bee-keepers for more definite particulars, and if all I have addressed will answer as fully as those I have already heard from, a report of value and general interest can be made. I hope to receive reports from all whom I addressed, and from many others.

A full report can be readily made out

A full report can be readily made out on a postal card, if the following form be taken as a guide, and may include the living and dead colonies of other bee-keepers in the neighborhood:

unprotected........

Number alive.

It is important that the kind of hive used in wintering be given, and following it the method of preparation for winter, then the number of colonies lost and the number left alive.

New Philadelphia, Ohio.

For the American Bee Journal.

#### Disturbing Bees in Winter.

C. A. HATCH.

Most writers on the subject of the present loss and bad condition of bees are inclined to lay the blame to long confinement. I have an interest in 23 colonies 10 miles from home, now in a cellar, where they have been since about Nov. 5, with no flight, making over 5 months' confinement, and yet I never had bees in a better condition. Fifty colonies at my home cellar have all had one good flight and part of them all had one good flight and part of them two, and they are not in as good conditwo, and they are not in as good condi-tion as the others; have lost 9. If bees cannot be put out for good in 2 weeks after a flight no good is done, but rather the reverse; it makes them un-

hive as before, and the operation is trouble. Confining longer than 2 weeks causes excessive consumption of honey, and hence dysentery and all its ills. If the foregoing "lesson of the hour" is true, and facts seem to sustain it, we should regard winter flights as a remedy for trouble already begun, rather than a preventive of trouble to come than a preventive of froulde to come. The cellars in both the above cases are dry, warm and well ventilated; both lots of bees being in Langstroth hives, of the same stock, and apparently in the same condition in the fall; why one

should need the flight and the other not. I do not know, but it was not the confinement that did it.

The following table of losses and manner of wintering may be of interest. It covers an area of 10 miles, except such as have already reported;

$\Lambda = 4$	colonies,	loss	.1	C	F
B-10		4.5	3	$-\widetilde{\mathbf{C}}$	į.
C25	6.4	4.	21	C	35
-10 - 10		4.4	10	S	F
E 6		6.6	-6	S	į.
F 9	6.6		-8	88	B&F
G-10	4.0	4.5	10	S	B&F
11 - 4		4.5	4	H	В
1 - 6	4 6	b b	6	11	B&F
Mine, 50	**		9	C	F
59	4 +	6.5	S	$\mathbf{C}$	F 5 b
- 23	6.6		()	()	$\Gamma$
4		* *	4	$^{\rm s}$	В
	6.4		4	В	$\mathbf{F}$
	_				
90	3		-96		

The letters indicate different owners; in the col-umn for manner of wintering, C stands for cellar, S for summer stand with straw packing, H. for house, SS for summer stand without protection, B for ba-ried. In last column F stands for frame live, B for box hive.

Ithaca, Wis., April 15, 1881.

For the American Bee Journal.

#### Success in Wintering Bees.

A. D. STOCKING.

As the past winter has been a severe one on bees, and as there has been great losses by both old and experienced and inexperienced bee keepers, the question arises, what is the cause and what the remedy? We have passed through 2 severe win-

We have passed through 2 severe winters on bees, and one the opposite of the other; the first open, wet and changeable, the last long, and severely cold; the loss of bees both winters being heavy. We need not discuss the method of wintering, for those who read the JOURNAL can see that whether wintered in the house the cellur or on the the 50 UKAR Can see that whether win-tered in the house, the cellar, or on the summer stands, in chaff or packed, there is not much difference in the re-sults; there has been success and loss in all these modes of wintering, there-fore we must look somewhere else for the cause. the cause.

the cause.

One year ago I wintered 18 colonies without any loss; this last fall 1 had 34 colonies and have lost but 3; the balance came through all right and are now getting a good deal of honey and are building up finely. I wintered mine on their summer stands, protected only by about 5 inches of fine cut buckwheat and wheat straw over the frames, and the weakest chaff cushions at the sides, and the entrances closed to about 2 inches; they had no flight for nearly 4 months.

I have no extractor, therefore took no

about 2 inches; they had no flight for nearly 4 months.

I have no extractor, therefore took no honey from the body of the hives and they were full of clover and basswood honey, and the hives full of bees, with the exception of 3 or 4 that were quite light. I got but very little surplus honey. I have come to this conclusion: That the cause of the great loss of bees was lack of young bees, poor stores and long confinement. It is generally considered that the fall honey is usually of poor quality; if we extract the early honey and leave the bees to winter on the fall honey we must expect heavy losses if the winter proves severe; of course many were short of stores and starved. I attribute my success wholly to my hives being full of bees and having good honey to winter on. I think many pay more attention to the mode of wintering than to the interior of the hives. If I was using the extractor of wintering than to the interior of the hives. If I was using the extractor and my bees had to winter on fall honey and I was not satisfied the honey

#### THOMAS C. NEWMAN.

EDITOR AND PROPRIETOR

CHICAGO, ILL., MAY 25, 1881.

#### Did Starvation Cause Dysentery?

Dr. Southwick contributes the following, as corroborative of the position he assumed in the Weekly BEE JOURNAL of April 20, that the prevalence of dysentery was owing to starvation:

I have found another case of dysentery. which I think will puzzle your long-confinement, bacteria and pollen men. As I understood the man, he said he took off the top boxes in the fall and put in their place a cushion; the bees, nearly a quart of them, got above the cushion, could not get back, and died there. said they had the dysentery bad, d said they had the dysentery bad, daubing the hive, and upper side of the cushion very much. Now, where did they get their honey with or without the bac feria to produce this dysentery and death? Is not this a pretty sure case of dysentery and death produced by staryation, or is it a first-class case of dysen-tery caused by gorging themselves with an imaginary honey and no chance for flight?

E. B. SOUTHWICK. flight? E. B. Mendon, May 13, 1881.

It was undoubtedly a first-class ease of dysentery caused by gorging on real honey. It is more than probable that the disturbance necessarily created in taking off the top sections caused the bees to gorge themselves before getting above the cushion, and certainly the close confinement is clearly established, inasmuch as they could not get out for a flight. If, on the other hand, the supposition be assumed that they were workers returning from the field, the probability is equally as strong that they were filled with honey when imprisoned. To our mind, Dr. Southwick has cited strong presumptive evidence to disprove the theory he attempts to establish.

Last fall we had occasion to visit an apiary of two hundred colonies, in Kane county, Ill., in which several colonies had died from sheer starvation. In many of the combs were cells filled with dead bees, but so far as our observation went, not a comb was soiled. We since learn every one of the 200 colonies died from starvation in the early days of winter. Our informant (an old beekeeper) said the hives were filled with as bright and clean combs as he ever saw. Another case: A gentleman from St. Clair county, Mich., remarked in the BEE JOURNAL office, a fortnight since, that he had lost about all his bees (some 200 colonies) by starvation, and had purchased another 100 colonies with which to build up again, and it would be an easy task, as his bees that starved had left a nice lot of clean combs.

We have examined many hives this spring in which the bees perished, and, as a rule—in fact almost universallywhere the excrement-covered combs showed that dysentery had prevailed, we observed more or less honey; sometimes the honey was in close proximity to the bees, in others further removed; but it was almost always to be found in

To what extent the presence of bacteria in the honey may be a factor of disease we cannot say, but we do not see any reason for believing that starvation use glass jars and tumblers. These are in favor of the small casks, for the finer argument in favor of bec-keeping.

is the cause of dysentery. Observation | always worth their cost in the familywould unusual cold and unremitting confinement; and it may be these factors are more or less each dependent on the others.

#### Best Package for Extracted Honey.

Mr. J. H. Shimer, of Hillsboro, Ill., asks the following question:

"What is the best style of packages for putting extracted honey on the mar-ket? I want to begin right, for a good start is half the battle. I have 118 colonies, all booming, and a good prospect for 10,000 lbs. of white clover honey."

The above question is one of the greatest importance in connection with beekeeping. If the product is for a home market, then, of course, the producer must study the local preference regarding the size and style of package, as well as the grade of honey most easily disposed of. As far as practicable, keep each grade of honey separate; it is a mistake to suppose a few pounds of inferior or different shade honey will make no difference in a large bulk of white clover honey, or that thereby a better rate will be obtained for the second grade article. Instead, the result will most likely be to class it all as second grade, and the price of all will be depreciated. Again, if possible, keep the white clover and basswood honey separate. In order to do this, keep a vigilant watch of the basswood bloom, and extract the white clover quite close before the bees commence gathering from the former. A little clover in the basswood honey, however, will not do the harm that would result if the proportions were reversed. After the basswood harvest is all gathered by the bees, extract it closely, as it will not do to taint any other honey, even though it be from fall flowers and somewhal darker, with its peculiar pungent flavor. For small retail packages, tin pails

with close-fitting covers are the best. Purchased by the gross or in lots of one thousand or more, the price is so inconsiderable that no consumer will object to paying what they cost in addition to the price of the honey, for they are so " handy to have in the house" that not one housewife in a hundred would wish to return the pail. Persons will often persuade themselves to purchase a pail of honey after lifting off the cover and tasting the contents, who would not be tempted were it in a tight-stoppered jar or a close-topped can, so they could only "feast the imagination" by reading the label.  $\Lambda$  neatly printed label should be gummed or pasted on each pail, stating the amount and kind of honey, name of apiarist by whom put up, and giving in a foot-note directions for liquifying the honey in case it shall become granulated. These pails might be of three sizes—1-quart, 2-quart and 1-gallon—holding, respectively, 2½ lbs., 5 lbs., and 10 lbs. We would not advise the use of screw-top cans; they are a nuisance in more ways than one. It is equally difficult to get an exact weight into and out of them; if the honey be granulated, it is difficult to liquify it without besmearing the can; and they are not convenient for general use in a family after the honey is consumed, so the purchaser feels that what is paid for the can is money thrown away.

has led us to think that excitement and the former for pickles, catsups, and a confinement would produce it, as also thousand other uses, while the latter are equally appreciated for their convenience in putting up jellies, etc. Jars and tumblers, like the tin pails, should be tastefully put up and labeled. For a retail market, excellence of goods should be the prime consideration, but the attractiveness of the package should never be lost sight of. Manufacturers of adulterated goods, of nearly every description, depend more upon effecting sales by the employment of attractive packages and tasteful, pretentious labels than upon the excellence of the pretended article sold. In this respect, bee-keepers have been wofully negligent, and many have appeared wholly indifferent as to the appearance of their honey, seeming to imagine that their personal assurance to the grocer of the purity of the article, was sufficient to convince the public of its desirableness. Nine times out of ten, New York or Chicago glucosed honey, in attractive packages, will find a sale at exorbitant figures, while unattractive pure honey goes begging the market at unremunerative prices.

If the honey be destined for a metropolitan or foreign market, an entirely different method of putting it up should be employed. No more convenient, attractive or economical package can be used than ten or fifteen gallon kegs. These should be spruce, pine or cypress. and never of hard-wood. Barrels are too heavy and cumbrous for convenient handling, too large and irregular in size for rapid sales, and too wasteful in leakage for profitable use. No hard-wood barrel is safe to put honey in till after it has been thoroughly waxed, and even this will not prevent leakage where the honey has granulated, because it will be necessary to take the head out of the barrel to get at the honey, and in order to do this, the hoops must be started and the staves sprung out, which breaks the wax at every joint where the staves come together, and they cannot be closed tightly again; therefore, if the honey be not all taken out at once, leakage is certain to follow. The wax also comes off the staves in scales and mixes with the honey, which is often very annoying. Soft-wood kegs need no waxing. If thoroughly drenched with water a few hours before using, no leakage will take place. Taking into account the value of the wax and time consumed in applying it, together with the price of the barrel, and the kegs will be the cheapest, without reckoning in their favor the less liability of leakage and greater convenience. As the jobber never pays for the barrel, the shipper should use the cheapest—if the best.

The preference of jobbers will always be found to favor the kegs holding 10 and 15 gallons. With a shipment of 10,000 lbs. of honey, we are confident 9,000 lbs., if in kegs holding 10 and 15 gallons--110 and 165 lbs-will all be sold before the remaining 1,000 lbs., if in two ordinary oak barrels of 500 lbs, each, provided the quality is the same. Many times jobbers and commission dealers decline small sales, rather than furnish smaller packages and give the time requisite for dividing up a large barrel of honey. We think we are safe in predicting that the time is rapidly approaching when there will be a discrim-

grades of extracted honey, whether for retailing or manufacturing purposes.

We cannot see anything about the large tin cans (5 and 10 gallons), whether round or square, to recommend them to public favor. They are very expensive, and require an outer wooden case to protect the can in transportation. This extra expense is a total loss to the apiarist, as no can is worth returning after a grocer has retailed its contents. We very much doubt, also, if any grocer could be found willing to buy a second 10-gallon can of honey at any price, after having had the contents of a first one granulate a few times.

Statistical Report.—The call is quite general for a statistical table of the results of the winter on the bees of America. In order to have it of any value it should be general and full. We will give it in the JOURNAL if we can have a general response, but a partial one will be annoying, and will not repay us for the labor and expense of getting it up. We invite attention to Dr. Tinker's remarks on this subject, on page 163. Be careful to follow the table there given, and let the reports be sent in at once. Dr. Tinker has promised to send us his statistical table next week, therefore all reports should now be sent to the BEE JOURNAL directly, that they may be included in the general statistical table.

#### BRITISH BEE JOURNAL.

The British Bee Journal commences a new volume with the May number. Mr. C. N. Abbott, its able editor, with whom we spent several very pleasant hours while in London, two years ago, is a thoroughly practical apiarist, and keeps up with the times in all progressive and scientific attainments. He commences the ninth year of the existence of the British Bee Journal with these characteristic words: 'For ourselves, we promise to do our best to deserve what it is not in mortal to command, success." The AMERICAN BEE JOURNAL extends its congratulations, and wishes its contemporary an unbounded success.

The Rev. Herbert R. Peel, the very efficient Secretary of the British Bee-Keepers' Association, we are exceedingly sorry to learn, is seriously ill. Mr. Peel is an enthusiastic apiarist, and one of the most progressive in England. We hope he will soon recover his wonted health.

The Weather in England.—The prolonged coldness of the weather, consequent on the prevalence of easterly winds during the past month, has sadly retarded the progress of favorites, for, excepting occasionally, they scarcely visited the fruit-blossoms with which Nature has so bountifully and beautifully embellished the earth, and many of the truits which she has so lavishly "brought to the birth" will not be "brought forth" through the impos-If smaller packages are wanted, then ination of at least one cent per pound sibility of apistical influence, a great

Bees and Honey Producing Bloom.-At a recent meeting of the Torrey Botanical Club Mr. Thomas Mehan, in a note in the Bulletin, of the Torrey Bo tanical Club, says:

I find that the behavior of bees is governed by circumstances. When flowers are abundant they visit those flowers are abundant they visit those only which they prefer; at other times they examine anything that comes in their way. At the time I am writing, (May 18) there is a dearth of garden flowers. Those of early spring are gone, and the later ones are not well formed. But columbines in many species are in bloom. The humble bee bores the end bloom. The humble bee bores the end of the nectaries and sucks the honey stored there, and the honey bee follows and sucks from the same hole what may be left, or what may be afterwards generate the honey gland. I have erated from the honey gland. I have often watched closely to learn whether the honey bee bored for honey. Its quick motions are unfavorable to correct observation. I thought I once caught it boring lilac flowers, but I afterwards counted all the flowers that had been bored by the humble bee, and had been bored by the humble bee, and then watched the work of the honey bee on the cluster, and there were no more bored afterwards than before. The columbines (aquilegie), with curved nectaries, such as A. Valgaris and A. Olimpica, are very favorable for obser-vation, as the slit is made on the upper side of the curve and the honey bee can easily be seen following after the can easily be seen following after the crumbs that may have been left on the strong one's table. I have no doubt, however, that it would bore for itself if it had the power, and perhaps it some-times does. The humble bee and the honey bee are evidently not the insects for which the columbine had this beautifully contrived nectar cup provided. to induce cross fertilization; and what the flavored one, so that it, and no other, could turn its tongue around those twisted spurs to get at the honey in the end, I think no student has yet discovered. discovered.

Empty Combs and Moth Worms.-In the Prairie Farmer, Mrs. L. Harrison

The warm weather of this month is promoting the hatching of moth larva (Galleria Cereana) in unoccupied comb. The eggs of the bee moth are very small and white. As soon as they hatch, to protect themselves from the bees they wrap themselves in a silken tube, which they have power to spin. They remain in this tunnel of silk during all their growth, enlarging it as they eat. By looking closely the presence of these larvae may be known by this robe of glittering silk along the surface of

comb.
In 3 or 4 weeks the larva are full grown, when it spins its cocoon, and issues from it in 2 weeks in a moth of the color of old boards. In an astonishing short time these worms will destroy the comb in a hive. Their anatomy is very different from ours, for they can digest comb and it makes them plump and fat. These worms breed in weak colonies, and those that are queenless, but we know from expensively that the transfel of Italians will rience that a teacupful of Italians will protect all the combs in a hive from their inroads. We have inserted a comb, badly infested with worms, into a strong colony of Italians, and in an incredibly short time they carried out

Some apiarists claim that freezing will destroy these insects in all stages. It was certainly cold enough the past it was certainly condenough the past winter in the open air for the experiment, and we find pleuty batching in moccupied comb thus wintered, at the present writing—May 11. These insects are great cowards, and love warnth and darkness, and we have observed that when couples fough they are served that when combs touch they are more likely to be infested than when hung separately. If unoccupied frames hung separately. If unoccupied frames of comb are hung up in a light, airy room, 2 inches apart, they will keep free from worms until needed. All combs in hives without bees, should be funigated. We do this by lighting our smoker, and when it is burning sprintly and sat it in a live. kle on sulphur and set it in a hive.

Pollen in the Combs. -- My report for when this year is, I lost in wintering 33 colonies; 6 are rather light. I usually have times in L. Jeffrey, on pages 146-7 of the Berriting. Journal, has hit the nail on the head garden about pollen in the combs for wintering; but I would put it in, in April. I have experimented in feeding in winter largely, and I like it; it may be the way out of our difficulties in these hard winters.

L. D. Davis. winters. J. I Holt, Mich., May 11, 1881.

The Frame for Winfer.—Bee-keeping is dreadfully set back here; box alder is in bloom, but not one bud where thousands might have been seen last year. My bees are all nice and busy. One colony shut up out-of-doors from Nov. 1, to April 15, came out to-day, healthy and in a normal condition. I see no reason for changing my method of wintering, except that I would recommend 30 lbs. of honey instead of 25. One point will eventually come out fully and that is that bees must have a frame long enough and deep enough for frame long enough and deep enough for the cluster to travel on all winter, with-out changing from side to side. Breaking cluster in winter, especially if pollen is plenty in the combs, always proexcitement, followed by dysenduces excitement, followed by dysentery, unless the cluster is broken by a cleansing tlight. I have repeatedly seen the bees, after having exhausted the stores in a few frames, prepare to break and change, and I have noted the results. A frame for wintering that is shorter than the Langstroth is a misthe results. A filame for windering that its shorter than the Langstroth is a mistake; 1 prefer them a little longer and nearly 3 inches deeper. Consumption of honey with me was light in 1873 (commencement of my experiments in wintering) till the winter just ended, which has simply been enormous. I have to feed. I am not discomfitted by Prof. Cook's report; there will be an outcome to that yet. One point I have fully proven, at least to my satisfaction, that is, that bees may remain shut up on pure honey, free from pollen, from Nov. I to April 15 without dysentery, and with trifling loss of bees from the colony. I have tested this the last 6 winters by trial of one colony each winter.

J. M. Shuck.

Des Moines, Iowa, April 29, 1881. Des Moines, Iowa, April 29, 1881.

The Opinion Prevailed.—In the Journal of May 18, in the report of the East-ern Michigan Convention this sentence occurs: "All agreed that further importation was undesirable." It should be: "the oninion provided." be: "the opinion prevailed that further importion is undesirable." The opinion was not unanimous, but seemed to be held by a majority of those present, as now published the minority are misrepresented.

A. B. Weed, Sec. Detroit, Mich., May 20, 1881.

Those Three-Peek Swarms.—In the Weekly Bee Journal of April 20, Mr. C. A. flatch remarks that he fears some novice may be ruined in trying to obtain such results as I reported. His remarks about basswood are all lost to me; I never wrote a word about bass-wood, neither do I claim any knowledge of it. That article was written by R. A. Morgan, who lives in the next county and makes a specialty of rearing basswood trees for sale from the seed, and ought to know whereof he writes. Those 3-peck swarms trouble him; and and hose speck swarms from the first and he gives figures to show how they could not get in the hive. Did he ever see one of his peck swarms contract at the approach of winter into a ball no larger than a child's head? That enormous yield of honey—215 lbs from the swarm will be first the first t and 185 lbs. from the parent colony—is 438 lbs. he says; reader, figure it. I stated that I took 430 lbs., which sold at 20 cents, and it netted me \$86. The tact that I live in a fertile valley, bordered by streams abounding in basswood manles alder willows etc. wood, maples, alder, willows, etc., bounded by high bluffs affording fall don't know much about bees only what flowers late, and have at least 8,000 acres of clover range, makes the statement no less true of my yield, even if our least 1 learned from the "A B C" and by watching the bees. A. Deaton. Carthage, N. C., May 11, 1881.

friend living 100 miles away has a small one. I gave my plan of taking comb honey last season. I send you a sample by mail of red clover honey, of which I took a very large surplus in June, before basswood, last year. My bees are in excellent condition; they began carrying in pollen April 15, and to-day they just roll in with the little yellow balls. I never saw so much brood at this season of the year, and considerable new honey is coming in, considerable new honey is coming in, I think from maple or willow, both being

very plenty at short range. E. A. Morgan. Arcadia, Wis., April 20, 1881.

The Results of the Winter.—I started into winter with 165 colonies; they were strong, and had plenty of scaled honey. strong, and had plenty of scaled honey. After 5½ months of steady cold weather, I had but 3 very weak colonies. My hees left 3,000 lbs. of scaled honey of the best quality. A few showed signs of dysentery in the hives, on top of the frames, and many more died before they reached that point. My bees died from extreme cold weather, long-continued. They were not sufficiently well nucked They were not sufficiently well packed on their summer stands. I live on the highest ground in Peru, and there was not one day from Nov. 10 until April 15. that was warm enough to open a hive with safety. One of our best bee men, at Granville, wintered his bees in the cellar, and lost 25 colonies. Another, at cellar, and lost 25 colonies. Another, at Henry, put into winter quarters 200 colonies, and saved only 40. One in this city had 40 colonies, but now has none left. Our lady bee-keeper on the prairie had 60 colonies. but now has no left. rie had 60 colonies, but now has only 2. The less we know about bee-keeping, the more we think we know; the same is true, however, in all other pursuits in life. Box-hive men fared the best this season. One man saved 2 out of 10 colonies; another, 2 out of 18; another, 6 ont of 20, with no protection whatever. one of 20, with no protection whatever. One man had 3 box hives; he removed the honey boxes from the top, left the holes open, set an empty hive on each one and saved all. I append a statement of my 4 years' work. I had but 1 colony in 1876. Commenced in 1877:

Bought during 4 years, 64 colonies....\$218-00 Material for hives, flxtures, etc....... 222-40 \$410.40 

Also, 1,400 straight combs.

I admit being somewhat at a loss to know what to do to be saved, but have concluded to go on, if I have to commence with one colony. We are about as badly off as the people in Kansas after they were honored.

ter they were hoppered. H. S. HACKMAN. Peru, Ill., May 1, 1881.

Winter Losses.—My loss is fully 50 per cent., and the remainder are very weak. Most of them were packed on the summer stands. I placed potatoes on the honey board of 2 or 3 and found spronts from 3 to 9 inches in length. Those in cellars lost less bees, but the combs were moldy and mice destroyed 3 or 4. A near neighbor had 11 and lost 3 or 4. A near neighbor had 11 and lost all but 2; another had hut 3 left out of 13; another had 16 and lost 8; another 9 and lost 5, another 8 and lost 4. One man claims to have wintered 13 in his chamber without loss; another put 13 in a dry cellar and lost 4; another had 9 and lost all. Others lost heavily but I have not learned to what extent.
II. B. Rolf.

Westfield, N. Y., May 16, 1881.

A Boy's Experience.—We have 3 colonies of bees, 2 blacks and 1 Italian, in good condition; they have commenced storing honey in the boxes very rapidly from the poplar and black gum. The from the poplar and black gum. The poplar bloom is very rich, there being now more bloom and honey than bees. I believe the blacks will beat the Italians, at any rate, they are working bet-ter in the boxes. My father says he expects 100 lbs. from each colony; he says I have the "ABC" book but need the

Bees in Canada.—By an observant perusal of a letter in the Bre Journal May 4, page 112, one would suppose that Outario is devistated of its bees; this is not the case; those put in good cellars, or houses built for storing bees, did not have heavy losses. Mr. M. Emigh, living 6 miles from this town, put into a cellar under advalling house. put into a cellar under a dwelling house, last November, 85 colonies, and took them out April 21; 5 colonies starved; temperature in cellar 40 to 50; and today some of them have 8 frames of brood. R. Martin, of this town, put away last fall 8 colonies; now he has 7. 1 put into a bee-house 100 colonies on Nov. 4, and into a cellar under a dwell-ing house 1 put 45 colonies on Nov. 10. I did not remove the summer quilts and opened the entrances to the full extent. opened the entrances to the full extent. I put them out April 15 in splendid condition. Losses to May 1, when I take stock for the year, 13 colonies—3 died with plenty of stores, 2 were robbed after being put on the summer stands, leaving 127 colonies; 4 of them are weak. My bees were never in a better condition at this season of the year than at present. The temperature better condition at time season of the year than at present. The temperature in the house was 38\[^2\) to 52\[^2\]; in cellar, 40\[^2\) to 50\[^2\], well ventilated. At moon today, at time of young bees playing, 1 saw drones flying.

J. B. Hall.

Woodstock, Ont., May 11, 1881.

No more Black Bees .- I have already reported going into winter quarters with 27 colonies (all black but 5), and coming out March 1, with 26, one black colony in an odd sized hive not being supplied with honey from the Italians, lived till the last of February and then died. Moving in March the and then died. Moving in March, the condition of the roads forced me to leave my bees seven miles away, till April 26, when 1 moved them up and found that 2 had deserted for want of honey, and 2 had stayved. Two others were so weak that they were miled. were so weak that they were united, I being queenless. Five in all were queenless, but that was a slight loss, as all my Italians were full of bees and brood, and drones were hatching. I took stores from them last fall to keep our blacks dive and brook stores from them last fall to keep my blacks alive, and now I have taken brood for my blacks to rear queens and to build them up with. I have been an advocate of black bees, or at least slow and cautions to change, but after this I shall doubt the judgement of any beekeeper who will have them, if he can get Italians at any price. If I have any on the place hereafter, I shall feel obliged to make some excuse or apolarity of them the place. obliged to make some excuse or apology for there being here. Indications with me are for early and profuse swarming, and I would advise all beekeepers who desire honey, rather than increase, to be on their guard. Mr. Shepherd, some miles northeast, has, I hear, lost 50 ont of 100 colonies. Dr. Foreman, of Milton, reports a loss of one out of 33 but gave no details. The one out of 33, but gave no details. The Dr. has the brightest bees and the tidiest apiary I ever visited. I enclose a little plant, or floweret, that I wish you little plant, or floweret, that I wish you to give the name of, though I am ashamed to ask any one to name a plant so common; yet the bees seem so busy on it that it would be interesting to know what to call it. White clover is very abundant, and the promise is for an abundant honey crop. I have lately seen a new honey rack, invented by E. Armstrong in which both only of the Armstrong, in which both ends of the rack act as wedge, while  $5\frac{1}{4}$  x6 $\frac{1}{4}$  and  $4\frac{1}{4}$ x5 $\frac{1}{4}$  boxes were so arranged that both or either could be put in the rack; the same separators answer for both sixes of boxes, and the glass was cut in strips as long as the box was wide, and strips as long as the box—was wide, and no glassing of sections was required, as the wedges held all very tightly together. I do not know whether it is patented or not, but it is a very superior honey rack, and the inventor deserves credit for it, as it can be made to fit any hive. One of your correspondents says that a dead-air space between double walls will prevent the formation of ice in the hive. Most of my laves are well and carefully made—with two  $T_{\rm w}$  walls, and from  $T_{\rm w}$  to  $T_{\rm w}$  of an inch  ${}^{7}_{8}$  walls, and from  ${}^{1}_{2}$  to  ${}^{7}_{8}$  of an inch between them, yet ice forms in them between them, yet ice forms in them before the thermometer marks zero, though they are tightly fitted on good stands, and no ventilation, except  $^3{\rm s}{\rm x}^2$  at the entrance — WM. CAMM. at the entrance WM. (Murrayville, Ill., May 1, 1881.

[It belongs to the aster family.—Ed.]

Wintered Well. - Afer 5 long weary months of close confinement in the cel-lar, my bees are again upon their summer stands. My bees have come through the ordeal well; I lost a few colonies by starvation. Not having a flight, I had no knowledge of their needs until too late. I put my bees on their summer stands April 25; next day they were carrying in pollen rapidly; the third day I looked through the hives and day I looked through the lives and found newhoney from swamp poplar, I suppose, as the willows had not then blossomed. I read in the BEE JOURNAL of terrible losses, and know personally many that have lost all, who have not many that have lost all, who have not reported. What few bees are left should be well cared for; I think there is a good prospect; white clover is plenty

where there was none last year. E. J. GOULD. Dundee, Ill., May 3, 1881.

Saved 60 per cent. of Bees.-Not less than 95 per cent, of the bees in Delaware Co., N. Y., are dead, but I have done better than that; I have saved 60 per cent, of mine. N. H. OWEN.

North Kortright, N. Y., May 11, 1881.

Success.—Bees have not wintered very well here. Those on summer stands without protection are all dead. Some have wintered well in cellars and some have lost all. I wintered 130 colonies without loss up to April 15, since then I have lost some and have united weak colonies and an now a dozen short, but none are as strong as they were one none are as strong as they were one year ago. Success to the BEE JOURNAL. X. D. WEST. NAL. Middleburgh, N. Y.

Early Swarms.—I had 2 large swarms ont to-day, and have several more about ready to swarm. B. WALKER. Capac, Mich., May 10, 1881.

No Loss in Winter .- My bees are Italians, and have wintered without loss, on the summer stands, with protection. They are strong and breeding nicely.

AMANDA PARSONS.

East Gloucester, Mass., May 18, 1881.

Statistics.-Now that winter is fairly over, and we begin to recover and count up the dead and living colonies, we would like very much to have a sta-tistical table, much like the one in your excellent Journal of October 1878. I think it could be obtained by giving notice through the Bee Journal. I notice through the BEE JOURNAL. I will do what I can to help its completion. Success to the BEE JOURNAL.

NEWELL E. FRANCE.

Platteville, Wis., April 25, 1881.

Pleasant Visit to Texas. -On May 11, 1 arrived at McKinney, Texas, to attend the State Bee-Keepers' Association. There was a good attendance and we had a very interesting meeting, at the apiary of President Andrews, whose hospitality 1 enjoyed. Many zealous bee-keepers were in attendance, among whom were: Mr. F. F. Collins, and Dr. Howard, Dr. Graham and others. They Howard, Dr. Graham and others. They gave me an enthusiastic welcome as President of the National Society, and I shall long remember this meeting with pleasure.

N. P. ALLEN.

The Condition of the Bees .- I will let The Condition of the Bees.—I will let you know how the bees are coming on about here. One man put 40 colonies in a cellar and took out 33 with bees in the hives. April 9; another man put 5 colonies in the cellar and they were all right; another having 35 or 36 in a bee house last fall had lost all by the first of March—the bee house had 2 thicknesses of beautiful and 2 thicknesses of beautiful and 2 thicknesses of beautiful and 3 thicknesses of page 10 and 3 thicknesses of pa March—the bee house had 2 thicknesses of boarding and 2 thicknesses of paper all around; another that wintered in a bee house, double-walled and packed, lost about 20 out of about 40 colonies; but perhaps a cider nill was to blame for that; another that wintered in a bee house lost nearly 12, and nearly all that were left out-of-doors without protection are dead. I had 22 colonies and 4 nuclei; the nuclei and 2 colonies tegton are dead. I had 22 colonies and 4 nuclei; the nuclei and 2 colonies starved, and one was queenless. All but 3 are in good condition. They were put in the cellar about Nov. 17, and took out April 9; one colony had the dysentery. The thermometer stood

be better, from past experience, if I had kept it about 10- to 45; they used mare honey than ever before. As to the cause of dysentery, I think G. M. Doolittle is right about the matter; this one of mine, last fall, was a strong this one of mine, last fall, was a strong colony and they have eaten more honey than any one in the lot. I don't know just why they get uneasy and do so, but I think that is all the trouble. Another colony was very heavy last fall, and seemed about as heavy when I took it out, and they have lots of honey and bees and are dry and nice. So, in proportion as they get and keen quiet are portion as they cat and keep quiet, are they in good condition. Such I could get out-of-doors, perhaps, before they appeared to know they were being moved, but the others would boil out in the cellar, making an uproar because there was a disturbance around them. I believe that a good cellar, rightly arranged, is best. Mine is 19 feet by 25 feet, divided through the middle by a lathed and plastered division and in the south end has a stove. When it gets too cold I build a fire and open the door between, and when I want to ventilate I do the same. V. W. KEENEY. Shirland, Ill., April 19, 1881. were being appeared to know they

The N. E. Convention.—We all enjoy a good joke, and those personally acquainted with the parties mentioned below will. I think, appreciate it:

Our friends, Messrs, Doolittle & Co., Have had their storm and calm, Are now consoled, like bees subdued By smoke, or sweet, or balm. President Root did well preside; But now his term has past; We still desire to hear of him, If only by "cold blast." If only by "cold blast."

Dr. Marks, who took his place—
Our choice—we all like well;
The hearty v. de that he received.
Is the rule by which to tell.

When Vice Doollittle took the char.
He filled it to the edge;
The discussions still continued.

From the hive down to the care.

A clown could never, never give, By either smile or grace, The dollars Bacon did receive As shown by smiling face. Our Secretary gave us information, Not in money or in stocks; But that a let or the cigar Both came from the same box.

Both came from the same fox.
Our fare was all that could be wished,
Our beds were low and wide;
But cornerwise, to stretch our length,
We lay there side by side.

Next year when we shall meet again, If the mercury is not much higher. We had better go, packed in chaff, Or have a better fire.

Seriha, N. Y. F. H. CYRENIUS.

[This was sent\_immediately after the Convention was held, but a press of important matter has prevented its publication till now .- ED.]

After the Battle.—One-half the bees wintered in repositories, in this locality, are dead, as well as 9-10 of those wintered on summer stands. I rewintered on summer stands. I re-ported on March 16, that my bees were in good condition, with the loss of 1 out of 68; they were returned to the cellar, and another warm day did not occur until April 16, when they were placed on the summer stands, with a loss of 2 on the summer stands, with a loss of 2 more. Spring dwindling, since, has caused a loss of 20 colonies; but if I had lost all, I should try again, with as much enthusiasm as ever. I have been much interested in the reports on win-tering. I think that apiarian science consists in successfully getting the bees through from November until May. In regard to the Weekly BEE JOURNAL In regard to the Weekly BEE JOURNAL I would say: For the man that is inter-ested in bee-keeping, from one month to another is too long to wait. I have been out to-day watching the blessed bees; the woods are full of flowers and bees; the words a.e. the apiary is booming.

C. II. FRANCE.

Erie, Pa., May 1, 1881.

Cellar Wintering. - About March I, Cellar Wintering.—About March 1, 1880, 1 took 4 colonies of bees out of the cellar, after 4 months' confinement; 3 were in good condition, but the other had to be fed. They were in good condition for honey gathering, but white clover and other honey-producers failed, and in the fall 1 had to feed them. Tincreased by natural swarming to 7, and bought 3; one of the latter left one day bought 3; one of the latter left one day

which I united and may have to give them the third. The remaining 5 colonies are in good condition. Early last summer 1 took \$12, worth of comb honey from them, but should not have done so if I had any idea that the season would be so poor. My bees were in the cellar last winter 160 days; they were dry and free from mildew; I did not be supported by the stript them till spring. I wrefer success I fill with a chaff cushion, ent done so if I had any fidea that the season would be so poor. My bees were in the cellar last winter 160 days; they were dry and free from mildew; I did not disturb them till spring. I prefer to winter in the cellar, and shall practice it till I find something better. All who keep bees should subscribe for the BEE JOURNAL; it is worth many times I am of the opinion that it is not advisable to clip the queens' wings to prevent swarming. I think the mutilation robs her of prestige and power.

WM. L. BACKENITO,

Iowa City, Iowa, April 18, 1881.

"Dollar" and "Tested" Queens.— The article on page 91, on "The Supply and Queen Trade" seems to infer that if we wish to improve our bees, we have only to get some high-priced queens, and it is accomplished. I do not believe the theory; we have to depend upon the honesty of the breeder, for we cannot examine the goods and select the best. I notice in one circular sent me, the breeder says that he rears dol-lar queens just the same as tested ones. but can better afford to sell them as soon as they begin to lay, for a dollar, than to test them at the higher price. That being the case, would it not be That being the case, would it not be better to test them ourselves and save the higher price? Would not some breeders having large orders for tested queens, fill the orders, even if they were not very prolific, if purely mated, etc? Success to the Weekly.

C. J. Asseltine.

Swarming Out.—I placed my bees on the summer stands April 8 in good order. After being in the open air for 112 hours one of the colonies left the hive, and, after a flight, they joined another colony, where they were accepted without strife. This colony had plenty of honey and a good queen; the hive was clean and all the combs bright. Why did it leave the hive? The bees of this same colony left the hive again on May 8, leaving brood in all stages, and joined another. Here they were only accepted after a severe light, in which several hundreds were killed. Why did they do it? What does it mean when bees come home loaded with pollen and stop at the entrance of with pollen and stop at the entrance of the hive and buzz for some time before entering? Otto Rohland. Narrowsburgh, N. Y., May 14, 1881.

[It is not a settled point, what causes abnormal swarming. We have known a colony to desert 3 or 4 hives before settling down to business permanently; then, again, we have known as many as 3 abnormal swarms to go in the same hive. Bees in gathering pollen sometimes come in contact with obnoxious plants, and it is generally supposed the fanning is done to purify themselves before entering the hive.—ED.]

Wintering Bees. - Any facts on this subject are interesting to those desirous obtaining information. Meeting a of obtaining information. Meeting a man who keeps bees, some distance from my home, I asked how they wintered. He replied in a "matter of course" manner: "First rate, sir." "How many had you in the fall?" said I. "Eight." "How many now," I inquired; "Eight, doing finely." pointing to 8 weather-beaten pune boxes on a bench on the south side of a fence. on a bench on the south side of a fence, on a bench on the south side of a tence, and 3½ feet from the ground, unprotected, except some rough boards nailed against the fence. There they stood in January, just as they did in August—no cellar, no chaff, no dead air spaces, and no dead bees. I do not give this instance to attack any theory or practice. The great has they the great mostle. tice, though I see that the great apostle of chaff hives has been no more successful than others. I will now give my own experience of 3 years with winterstarved, and one was queeness. All bought 3; one of the atteried one day own experience of 3 years with winterbut 3 are in good condition. They in my absence, leaving 9 which I had to ing on the summer stands. I use Sinwere put in the cellar about Nov. 17, feed. One colony, by some oversight, phicity hives, with frames the short way and took out April 9; one colony had did not get enough, and starved. I took of it, instead of the regular Langstroth them from the cellar last week, and 3 frame; by this, I am able to snugly about 31 above zero; I think it would were weak (1 being queenless), 2 of tuck in a three frame nucleus, or a 15

in stooping over it. The four-inch space I fill with a chaff cushion, cut straw, or cut corn stalks does as well as either. I remove the cap, leave the duck quilt on, put on a thick chaff cushion lapping well over on the packing and they are safe in winter quarters. Last winter I put 24 up in this way, and as in the past, they all came out sound. I remove all packing and leave a deadair space in summer, which is cooler and facilitates working. My bees are leather-colored Italians; the pro-geny of which I mean to cross this summer with Cyprean drones. Stelton, N. J. G. W. Thompson.

Bees eared for, Doing Well.— Fifty per cent, of all the bees that were left on summer stands in this locality are dead, while about 2½ per cent. of those that were cared for are dead; besides the uncared for are very weak and build up slowly, while those cared for are full up stowly, while those cared for are full and running over. I had S swarms by the 16th inst., from 16 colonies that I had cared for: I don't know of another swarm yet in all this locality. Bees are doing well; nectar is plenty; bloom is flourishing and filling the air with perfune.

ROBERT CORRETT. ROBERT CORBETT.

Manhattan, Kas., May 19, 1881.

Bee-Keeping in Missouri.—Nearly all the bees are dead in this locality. I put in winter quarters last fall 165 colo-nies, and only have 50 left, and those very weak. A neighbor had 100 colo-nies and lost all; another had 45, only 10 left; another had 43, only 10 left, and so on; but few are left. All winter on the summer stands without protection, this being a mild climate. Some win-tere we have no snow, but the past wintere we have no snow, but the past winter has been the most severe one ever known. This is in general a splendid locality for bees. We have usually very mild winters and a vast amount of wild flowers, which commence blooming about March 15 and last until frost; among which are maple, hazel, gun, basswood, poplar, grapevine, wild locust, foxtail, boneset, sumae, blackberry, golden rod, ditney, Spanish needle, tar blanket, horsenint, white clover, etc. I am well pleased with the Weekly Bee Lournand. 

Poplar Bluff, Mo.

Separating Swarms.—If Messrs, Bray & Seacord's manner of separating swarms is really effective, I hope that they will give a more thorough explananation of the operation than was given in their article on that subject in the BEE JOURNAL of April 6, which is not considered satisfactory by bee-keepers. With your permission, Mr. Editor, I will call their attention to the matter.

Winnetka, Ill., May 19, 1881.

Very Thin Foundation.—I mail you to-day, Mr. Editor, samples of comb foundation made on the Dunham mafoundation made on the Dunham machine, the lightest of which will measure fully 11 feet to the pound. I do not send it for the purpose of advertising, for I do not care to make it for any one, but to show that the Dunham comb foundation can be made equal to any, for surplus.

J. G. WHITTEN.

[These samples are as near perfection as we can wish, and shows what can be accomplished by the persistent efforts of the skillful manufacturer.—ED.]

Out of the Woods. - I increased my bees to 40 colonies in 1880. I have never lost a colony in wintering. My method is on summer stands, in simplicity hives, with 5 inches of chaff and 1-inch lime cushion. I am the originator of hime cushion. I am the originator of this lime idea, and wrote the first letter on it, which was published in Gleanings for Dec., 1880, pages 579-80.

C. LOYER.

Reisterstown, Md., May 10, 1881.

#### SPECIAL NOTICES.

Single copies of the Journal are sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

The Volume of the BEE Jour-NAL for 1880, bound in stiff paper covers, will be sent by mail, for \$1.50.

When changing a postoffice address, mention the old address as well as the new one.

₩e have prepared Ribbon Badges for bee-keepers, on which are printed a large bee in gold. Price 10 cents each, or \$8.00 per hundred.

Notices and advertisements intended for the Weekly BEE JOURNAL must reach this office by Friday of the week previous.

We can supply but a few more of the back numbers to new subscribers. If any want them, they must be sent for soon.

A Safe and Sure Means of restoring the youthful color of the hair is furnished by Parker's Hair Balsam, which is deservedly popular from its superior clean-liness. 18w4t

Constitutions and By-Laws for local Associations \$2 per 100. The name of the Association printed in the blanks for 50 cents extra.

Sample copies of the Weekly BEE JOURNAL will be sent free to any names that may be sent in. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

The date following the name on The date following the name on the wrapper label of this paper indicates the time to which you have paid. In making remittances, always send by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, and local checks, are not taken by the banks in this city except at a discount of 25c., to pay expense of

Premiums.—For a club of 2, weekly we will give a copy of "Bee-Culture;" for a club of 5, weekly, we will give a copy of "Cook's Manual," bound in cloth; for a club of 6, we give a copy of the Journal for a year free. Do not forget that it will pay to devote a few hours to the Bee Journal.

At the Chicago meeting of the National Society we were requested to get photographs of the leading apiarists, to photographs of the leading apiarists, to sell to those who wanted them. We can now supply the following at 25 cents each: Dzierzon, the Baron of Berlepsch, and Langstroth. The likeness of Mr. Langstroth we have copied, is one furnished by his daughter, who says, "it is the only one ever taken when he was in good health and spirits." We are glad to be able to secure one of such are glad to be able to secure one of such a satisfactory nature.

It would save us much trouble, if all would be particular to give their P.O. all would be particular to give their P.O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name. Many others having no Postoffice, County or State. Also, if you live near one postoffice and get your main at another, be sure to give the address we have on our list.

Food for the Brain and Nerves that will invigorate the body without intoxicating, is what we need in these days of rush and worry. Parker's Ginger Tonic restores the vital energies, soothes the the nerves and brings good health quicker than anything you can use.—Tribune. See other column.

#### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

#### CHICAGO.

CHICAGO.

HONEY The market is plentifully supplied with honey, and sales are slow at weak, easy prices. Quotable at Localse, for strictly choice white comb in 1 and 2 lb, boxes; at 10612c, for common dark-colored and broken lots. Extracted, 7560348c, BEESWAX. Choice yellow, 20623c; dark, 15617.

HONEY.—Best white comb honey, small neat nekages, Hotler, dark Hotle; large boxes 2c. less.— 'hite extracted, 'bottle; dark, Tass.' BEESWAX.—Prime quality, 20@25c.

#### CINCINNATI.

HONEY.—The market for extracted clover honey good, at 85 fec. Comb honey is of slow sale at loc. or the best.

BEESWAX—1852c. C. F. MUTH.

IIONEY-Being now between seasons, there is not much changing hands in honey. Stocks are small, and in many cases held at a limit above buyers views, in anticipation of improved prices later on. The first consignments of new will probably not arrive before the aiddle of June. A shipment of 556 cases and 174 bbls, representing previous purchases, went forward to Liverpool this week. We quote white comb, 126446c; dark togo d, 96516c. Extracted, choice to extra white, 556664 (at and candied, 46556c.

died, 4425 Sec. BEESWAX—219,22c., as to color, STEARNS & SMITH, 423 Front Street. San Francisco, Cal., May 14, 1881.

#### \_\_\_\_ CLUBBING LIST.

We supply the Weekly American Ree Journal and any of the following periodicals, for 1881, at the prices quoted in the last column of figures. The

## Florida Land--640 Acres.

CHEAP FOR CASH.

DESCRIPTION,—Sec. 4, township 7, south range 7 west, Franklin county, Florida, situated about 50 miles south of the Georgia line, 25 miles west or the city of Tallahasse, the capital of the State, and about 25 miles northeast of the city of Apalachicola, a searport on the Gulf of Mexico, and within 2 sections (5 and 6) of the Apalachicola river; the soil is a rich, sandy loam, covered with timber. It was conveyed on Dec. 31st, 1875, by Col. Alexander McDonald, who owned 6 sections, including the above, to J. M. Murphy, for \$3,300, and on Sept. 5th. 1877, by him conveyed to the underskined for \$3,000. The title is perfect, and it is unincumbered, as shown by an abstract from the Kecords of the county, dily attested by the County Clerk; the taxes are all paid and the receipts are in my possessium.

I will sell the above at a bargain for cash, or trade for a small farm, or other desirable property. An offer for it is respectfully solicited. Address.

#### Glucose, Foul Brood and Absorbents.

S. MACDONNELL.

I am much pleased by the attention, characteristic of Americans, which beekeepers are giving to seeking special legislation for the benefit of those engaged in the "noble hobby." The employment of glucose (a material alike deleterious, as food, to man and bee) in the adulteration of Nature's delicious and wholesome, sweet should be sunthe adulteration of Nature's delicious and wholesome sweet, should be suppressed by the strong arm of the law, and your conventions will not have existed in vain if they are the means of gaining this end. The regular communication, which of late years has been opened up between San Francisco and this city, has caused large quantities of California honey, delicious to the eye and with most attractive packing, to come into our market. Since the adulting the same come into our market. Since the adulting the same come into our market. come into our market. Since the adulteration by glucose has been ventilated so freely in your Journal I have looked on all American honey with suspicion, and have eschewed it in favor of the more homely looking Colonial ar-

of the more homely looking Colonial article, for home consumption.

The necessity of seeking legislation for the suppression of foul brood shows that many bee-keepers with you are ignorant of the value of the many books and journals devoted to bee-culture. The suppression of foul brood is, I think, a matter which legislation alone will not effect. It may remedy the real evil of ignorance by compelling beekeepers to acquire the knowledge necessary to combat the ailment and to treat it according to rule, a point which

essary to combat the ailment and to treat it according to rule, a point which would, perhaps, be gained as easily by a greater diffusion of bee-literature.

The experiments in absorbing moisture in bee hives, referred to in your number of the 16th of February, are very ingenious. It seems to me, though, that not only is it advisable to

find some material to absorb moisture, find some material to absorb moisture, but also one to absorb carbonic acid, the product of the respiration of the bees. This slaked lime will do, but slowly. If my knowledge as an amateur chemist is not in error, I think that caustic potash would do so more readily, and also absorb moisture. For absorbing moisture alone, chloride of calcium would be effective, perhaps to such an extent as to keep the interior too dry, if such a state be possible.

I have much pleasure in adding my

I have much pleasure in adding my acknowledgment to the many which acknowledgment to the many which you have already received of the value of the Weekly Bee Journal. It is marked not only by the variety and extent of its subjects, but also by the fairness and feurlessness with which all matters of controversy are treated. matters of controversy are treated. The change from a Monthly to a Weekly is a great benefit to subscribers.

These Colonies afford a splendid opportunity for the cultivation of bees, but unfortunately only a little is known of the scientific management. Our farmers and fruit growers keep bees in farmers and fruit growers keep bees in boxes, in some cases in considerable quantities. They are alive to the benefit of robbing by driving the bees into an empty box, in preference to using sulphur, but beyond this no step in advance has been attempted, with but one exception, that of a gentleman having a bee-farm within 7 miles of Syd where 250 colonies in frame hives are to be found. Here, however, the progress has stopped with the frame hives, as no superiority is attempted beyond the use of large bell-glasses.

The summer now drawing to a close has been unusually bad for bee-keeping, owing to the severe dronth which withered up all honey producing flowers, with others. So ruinous was the dry season to plant life that our horticultural societies were obliged in most instances to abandon their exhibitions on account of their being nothing to show.

Last winter was unusually warm dur-Last winter was unusually warm during the days, but the nights were sufficiently cold to cover the water in my fowl troughs with a thin coat of ice. Generally we have weeks together of fine, dry, sharp weather, with frosts frequently at night. When rain sets in, the temperature rises and the rain is exceptionally a drying searching. is accompanied by a driving, searching wind. During fine weather it is seldom too cold for bees to fly and gather honey and pollen, although in but small quantities. and polen, although in our share quantities. Mignonette bloomed through last winter, when it was continually made merry with the hum of bees. The bulk of the bees remained in a cluster in the center of the hives, breeding being evidently abandoned.

I imported a quantity of wired foundation from Mr. A. II. Newman. Before its receipt I made a few sheets of plain foundation by dipping a plaster mould into molten wax. The homemould into molten wax. The home-made article was rough and clumsy— the imported was beautifully finished, nevertheless I found that when a sheet of each were placed side by side in a hive, the bees invariably commenced operations on the home-made unwired article. I have been unable to tell whether it was the wire or the material used to prevent the way sticking to used to prevent the wax sticking to the roller, to which the bees objected.

Sydney, Australia, April 14, 1881.

For the American Bee Journal. Cleansing Moldy Combs.

A. G. W.

Thinking some of the readers of the BEE JOURNAL may be troubled with mildew and mouldy combs which they have stored away, I send the plan I pursued to cleanse them.

Placing upright a plank, 2 inches thick and about 6 feet long against a

Placing upright a plank, 2 inches thick and about 6 feet long against a building, I put a frame of comb upside down upon it, the whole side of the comb toward me with the cells slanting upward. Then taking a Whitman's Fountain Pump with the sprinkler attachments, I "dose" the comb.

In this position of the comb, you get the pump at the same angle as cells, and throw water to the bottom of them. On the emply comb and those containing fermented honey, I throw the water hard, washing the cells out clean. With sealed honey I do not squirt so hard. After washing one side, I turn the other and treat it the same way.

The cells not sealed will now be full of water. Taking the bottom of the frame in the right hand, and the top in the left, hold it flat before you. Then give the frame a succession of upward jerks toward the left, when nearly all the water will be removed. Leave them upside down for half a day or so, until dry, when they are ready to use or store away. This may seem tedious, but it surely saves the bees considerable work, if in fact they could do it at all, as some of my combs were covered ble work, if in fact they could do it at all, as some of my combs were covered so with mould the cells could not be

Working as well as it does in this case, I believe the pump would do splendid service in washing dead bees out of combs, at least it will do to try. It would also be a good means for introducing salicylic acid, sulphur etc. Danville, Ill., May 21, 1881.

#### How to Prepare Bees for Shipping.

J. HOPKINS

Having just received 2 colonies of Italians from Mr. R. Wilkin, San Bnenventura, Cal., I have thought that by stating how they were packed, the condition they arrived in, etc., the knowledge might be valuable to others

I have read your editorial, page 12, ol. xvii, on the above subject, and think on one or two points an improvement might be made.

The hives my bees came in were 8 framed "Langstroth." tin rabbets, bottom board flush with entrance nailed on to body of hive, cover flat with 1 inch strips, 1½ inches wide, nailed across the top at each end; from one end of cover toward the centre, over the

the comb and bar, making it secure. Two wire binders were put round each frame,  $\frac{1}{3}$  from each end, and in one of the centre frames a flat bottle containthe centre frames a flat bottle containing water was fastened with wire, for which a part of the comb had been cut away next to the end bar; this, of course, was neck downward, corked and some lampwick communicating with the water. The frames rested in a notched strip on bottom board the width of the hive (not nailed), and two notched strips secured them on top, the cover going down on these, held all cover going down on these, held all firmly. The entrances were covered with wire cloth, and directions for giving water on the sponge were pasted on

each hive.

The bees, by date of letter received, must have been confined in the hives about 6 weeks. On arrival, I found one to be in splendid condition, although there were a large number of dead bees there were a large number of dead bees in the hive; the other was not in quite so good a condition, owing to insuffi-cient ventilation, caused by the entrance being clogged with dead bees; both were suffering slightly with dysentery, from which, however, they are recover-ing. About a gill of water had been used from each bottle. There was no used from each bottle. There was no sealed brood in the hives on arrival, but both queens had commenced to lay, as there were hatched larvæ in some of the cells. They are now working away splendidly. The hints gained by this shipment are shipment are:

shipment are:

1. Do not tack wire cloth over the entrance, but use a hive with a portico and tack wire cloth over that. This allows the bees to drag out their dead and clean the hive; and I have no doubt would tend greatly to prevent dysentery.

2. Do not neglect the bottle of water inside the hive, as by this means they are not so dependant on the water from the outside, which is liable to be neglected.

lected.
3. Arrange the sponge so that it may

3. Arrange the sponge so that it may be taken out and wetted, instead of water being poured on.

I believe that bees packed in the above way with plenty of sealed brood and honey at starting, would travel safely round the world.

New York and April 10 1881

#### The Three Bands of Italian Bees.

DAVID RICE, SR.

My father kept bees, and in my youth I was familiar with their management. For the past 25 years I have kept bees, and I have a mania for fine bees. About 13 years ago I bought the first Italian bees I ever owned, giving \$10 for a fine queen, but her progeny did not come up to my expectations; they showed only 2 yellow bands besides the connecting segment. I have bought many since in the hopes of getting those that would produce the 3-banded workers, but I have so far been end of cover toward the centre, over the middle frames, a piece about 9x5 inches sawn out, and I inch strips 1½ inches wide nailed round the edge on upper side. This hole was covered with wire cloth on under side, a sponge laid on that, and then covered with wire cloth on upper side, and the cover screwed down. The frames contained old tough comb, and where they had not been built right down to the bottom bar strips of wood were joined in between thorax is attached. Had I known this years ago I should not have purchased so many queens, trying to get a third

so many queens, trying to get a third ring besides that segment.

I find it very difficult to keep an apiary up to the standard of purity. Queens will mate with a scrub drone as quickly as with fine pure stock, and in fact, seem to prefer them, for though I have discarded all native stock years ago, more than ½ of my queens have been tertilized by black drones, and yet there are not over a dozen colonies of there are not over a dozen colonies of black bees within a radius of 4 miles.

black bees within a radius of 4 inites. I have wintered some of my bees in the cellar for many years, and never lost a colony, except by starvation. My cellar is dry and well ventilated, and never freezes. I always give plenty of upward ventilation, and yet the bives and combs get damp and moldy. I do not like cellar wintering—I do not think it bealthy. it healthy.

The plan of wintering I like best is to make a box, 6 inches larger than the hive, all around and above, taller on one side than on the other to give a slanting roof; then fill in with chaff, straw, hay or leaves, and cover the top with boards. I let them remain so till late in the critical who it is warm, they late in the spring when it is warm; they do not fly out every time the sun shines in the winter. In the spring they are strong and healthy. I have practiced this plan for some time with excellent

I have wintered bees in many different hives and by various methods, and have found that they always furnished themselves with all the moisture they

themselves with all the moisture they needed, and even more.

I feel jolly; I have saved half of mine during the past winter, while so many have lost all. My bees had but little honey in the fall and what they did have was of very poor quality, and I expected great mortality. I hope the present season will yield plenteously.

With the multitude, I welcome the Weekly BEE JOURNAL. It is the best, cheapest and most reliable bee literature of the age.

Richfield, Ill.

#### Wired Foundation a Success.

J. E. SOLOMON.

The season has come when every bee-keeper should know how to obtain bee-keeper should know how to obtain the most profit or pleasure from his bees. For the last 2 or 3 years I have watched the experience of other bee-keepers with comb foundation as re-ported through the Journal, at Con-ventions, and elsewhere, and I confailure, the chief difficulty being its warping out of position and eventually falling to the bottom of the hive, causing loss of labor as well as disappointment, although some seemed to have success with it. But I could not help thinking that the invention of foundathinking that the invention of founda-tion was a grand step in the right direc-tion, and hoped that some way would be devised so that whole sheets could be used in the brood chamber without fear of sagging or otherwise injuring the occupants. Hearing that the Given machine had overcome the difficulty by pressing the sheet of wax into comb and fastening it into the frame, at one onefastening it into the frame at one operation, holding it in its proper position by the aid of fine wires indented in the wax, I felt so sure that the sagging difficulty was overcome that I at once wrote to Mr. Given about the matter, and linally purchased a machine for making wired foundation in the frame. With wax about 6 Langstroth sheets to the pound, and my machine, I have made hundreds of wired frames, ready to be placed in the hives, and as soon as or be placed in the nives, and as soon as swarms issued I put in a proper number of frames, introduce the swarms to their new homes, never thinking of sagging or getting out of place, even with a large swarm in the warmest weather.

On examination 1 generally find several combs containing a patch of honey or eggs, or both, in from 6 to 10 hours,

fathers of the hive" to feed and nurse, which is no small matter to consider when we have a large number of hives.

I noticed in some article relating to wired foundation that it was destruc-tive to the brood batched in the cells through which the wires pass. I have examined very closely, with a friend of mine, the young brood as they emerged from those identical cells, and we profrom those identical cells, and we pronounced them as perfect in all respects as those from any part of the hive—if there is any difference, my microscope fails to show it. At all events I am perfectly well satisfied that I have a great prize in the Given Wired Foundation Press, with which I can make a superior article of foundation, either with or without wires thick medium. perior article of foundation, either with or without wires, thick, medium, or very thin, for starters in sections or boxes, and all with equal facility. I would not like to part with my machine for 5 times its cost if I could not get another. I think 4 days on good foundation equal to 10 days on empty frames.

I have watched with great interest, during the most 18 years the round

during the past 18 years, the rapid strides some inventive minds have made in regard to bee-culture for profit, as compared with the superstition of the past, which for ages have reigned su-preme. With the information we re-ceive from the excellent bee periodical sit would be surprising indeed if something wond be surprising indeed it sometiming wonderful was not accomplished. Now bee-culture is a science pretty well understood; a few years ago it was covered with the thick mist of ignorance and superstition. In a great measure we owe what we know about the apiary we owe what we know about the apiary and its management to books and journals devoted wholly to the subject, of which I can truly say I think the AMERCIAN BEE JOURNAL one of the very best; and anyone, whether professional or amateur, desiring a knowledge of the high hear or amateur, desiring a knowledge of the hidden mysteries of the hive, has no excuse for being ignorant, if he will take the trouble to read and learn the lessons therein contained. Brighton Village, Ont.

For the American Bee Journal.

#### Calling Things by Wrong Names.

o. o. poppleton.

In the BEE JOURNAL of April 27 is an article written by Prof. Cook, giving the results of different modes of wintering bees at the Agricultural College. I always take very great interest in anything from his pen, but I want to include in a little friendly criticism on this peticle.

this article.
While the Professor has not said in so many words, that the hives he tried to winter a part of his bees in were chaff hives, yet there is no question from the entire tenor of what he writes but that is what he thought they were and was the impression he intended to and was the impression he intended to convey. But has he not called those hives by a wrong name, thus conveying a wrong impression and almost entirely nullifying the value of his arguments? A hive packed with straw around four sides and chaff on top, is not a chaff hive in any sense of the word.

Some may think this a small mistake but to me it is a very important one. I have used chaff hives for the past 7 winters, and my experience has proved that the liner and cleaner chaff is the best. I have entirely discarded the use of the coarser kinds of chaff, such as that from wheat and oats, and use only that from timothy seed, and I go to the trouble of even sifting that, so as to have it as fine and free from coarse particles as possible. I use a thickness of only 5 inches of chaff around my bees, but I prefer that amount of line chaff rather than 3 feet of straw around them. I hope Prof. Cook will continue his experiments in different methods of Some may think this a small mistake

experiments in different methods of wintering, and that he will give real chaff hives a trial. I would caution all, however, against the use of oat chaff, for that has a decided tendency to become damp when used around bees.

I am not among those who think any one method of wintering to be all right and all others wrong. I simply know that chaff-hive wintering in this secand in a few days the whole hive would be full, every comb nice and true, and every bee to be hatched in those combs would be a worker and able to help support the family—no idle drones or "lazy" losses by wintering in chaff hives, can lived through it all.

In mas not comment kined ans nees for the chaff-hive wintering in this section has been more uniformly successive rad colonies, and as an experiment full that chaff-hive wintering, and I am inclined to think that the report, heavy losses by wintering in chaff hives, can lived through it all.

be traced to other causes, such as poor condition of colonies in the fall, the use

condition of colonies in the fall, the use of straw instead of chaff, etc.

My own loss is 6 out of 115, all in chaff hives, and a neighboring beckeeper, in a card received yesterday, says, in regard to his bees, that "some are good, some light and many dead—out-door wintering with me has been successful—no loss." He had some 40 or 50 colonies in chaff hives, out-of-doors, and nearly 200 in the cellar, thou making a direct contrast with Prof. Cook's experience, only he used chaff, while the Professor used straw.

I am among those who at first had doubts about the value to honey producers of a Weekly JOURNAL, but those doubts have gone. News in our business sein any other is worth so much

ducers of a Weekly JOURNAL, but those doubts have gone. News in our business, as in any other, is worth so much more if only 3 or 4 days old, instead of that many weeks, and I hope we can always keep at least one standard Weekly BEE JOURNAL.

Williamstown, Iowa, March 3, 1881.

For the American Bee Journal.

#### Wintering Bees-A Few Facts.

H. D. BURRELL.

As nearly as can be ascertained by careful inquiries, from about 1,500 colonies of bees in Van Buren Co. last fall. not over 250 colonies are alive now. My loss is 75 from 153. It is difficult to find out the exact facts, as many will give only evasive answers to inquiries about

their losses.
Why is it so many have died? Some have starved, but the main trouble has been dysentery. Now what are its been dysentery. Now what are its causes? One able writer says confinement, but facts do not seem to prove that the only cause. The past winter my bees were confined about 130 days, my bees were commed about 130 days, yet ¾ of them showed no signs of disease until April. From March 6 to 10 it was mild and pleasant here, and bees flew well; 28 were dead from 153. Most of the remaining colonies were strong and healthy, and we felt confident but tew would die. But alas! another month of winter followed, and in 3 weeks from the time they flew well dysentery was playing sad havoc with the best colonies. Now why did these 3 weeks' confinement in the spring cause disease in these colonies when 130 days' confinement did not in the winter? In the winter of 1879-80 our bees were not confined 6 weeks at one time. They were carefully protected with chaff on their summer stands, and the winter was mild, yet before Jan. I many colonies were dead from dysentery, and before May first, 36 per cent. were gone from the same primary cause. Surely confinement was not the cause of the dis-

ease.

For 40 years Thos. Kemp has lived on a farm, 3 miles south, and for nearly that time has kept bees. He "can't manage your new-fangled hives" though. He tells me (and he is well known as a reliable man), his bees never had dysentery but once (in the spring of 1872), before this season and he seldom leases a colour, event by spring of 1872), before this season and he seldom loses a colony, except by starvation. Last fall he had 20 or 25 colonies, (he "never counts them, and don't know how many there are,") in old box hives. Many have been used so long the bottoms have rotted. A couple of boards are thrown on the ground, often a couple of inches apart, and the bottomless hives set on them. No arrangements are made for surplus boxes, but when he wants honey he boxes, but when he wants honey he "takes up" a swarm. Last writer 2 died and 5 came out weak, and as bees could get out or in at a dozen or more places, and they received no attention,

they were robbed out.

Last season I bought 16 colonies of him, and never had better working stock in my apiary. One colony produced over 100 lbs. in sections, notwithauted over 100 lbs. In sections, notwithstanding the poor season. I Italianized all but 6 colonies of them, which I saved to see if they would winter better than Italians, but they could not stand civilization. All died. Now why has not confinement killed his bees?

If, E. Bidwell told me he once buried appears to the season of the seas

Absorbents are now generally regarded as essential to successful wintering of bees. Last fall about 1-5 of my colonies were arranged with absorbents about them, and carefully packed with chaff on the summer stands. The with chaff on the summer stands. The balance were placed in packing boxes, but chaff could not be procured for packing them until after winter had set in. The brood frames were covered with enameled cloth, and that by a % inch solid board. Hoping mild weather would soon come, and absorbents could be arranged, the boxes were filled with chaff. Mild weather did come—in March—and these colonies, almost hermetically sealed, save an entrance at the bottom \$\frac{3}{8}\text{4}\$ inches, were in better condition than those arranged with abcondition than those arranged with absorbents or upward ventilation.

sorbents or upward ventilation.
Facts seems to prove that none of us know much about wintering bees. A few seem to be successful for a time, but sooner or later the dread scourge comes, and empty hives are left to tell the tale, and refute pet theories. The theory that impure honey causes the trouble seems best substantiated by facts. If I knewall my hives contained perfectly pure stores and good strong colonies of bees not too old, I would not fear loss under almost any circumstances; while if I knew that they contained impure stores, I should expect a heavy loss no matter how they were heavy loss no matter how they protected, if they were confined a long

#### Using Separators, Foundation, etc.

JAMES HEDDON.

Do the largest and most "successful" Do the largest and most "successful" honey producers use separators? I believe not. My experience with a box and a half of tin is decidedly against them. I wonder what Mr. Doolittle saw the first year he used them that caused him to wish to "divide the bees as little as possible" the second year.

My method of applying sections, without separators, must be in some way.

My method of applying sections, without separators, must be in some way superior to his, for I crate 99 out of 100, on an average, and with Moore's style of glassing (which I count the best extant) I can glass a large majority, in good style. I do not propose to use sections without full sized sheets of combinant time in the property of the standard property in the property of the style of the standard property of the style of the tions without full sized sheets of comb foundation in each and every one, separators or no separators. (This is said not only in behalf of my trade in foundation, but also that of Messrs. Alfred H. Newman, A. I. Root, J. H. Nellis, Chas. Dadant, and seventy or eighty others, who dabble slightly in its manufacture or sale). Yes, it is true, that we do not need to attach any costly and complicated contrivance to make our chosen surplus system work to our personner. chosen surplus system work to our per-fect satisfaction.

The method I practice 1 think the simplest and most rapid of any extant. They are in use by numerons producers, and I have never known one to abandon it for any other. The reason I discarded the brood frame system was becarded the brood frame system was because the sections were so stuck up with propolis. I refer to R. A. Burnett, of Chicago, on the comparative cleanliness of sections received from myself and others. But suppose for logic's sake that I am untruthful, does that change the law of cause and effect? Do natural principles depend upon my reputation for their existence and regular action? Cannot Mr. Doolittle give us an article whose points are based upon reason, and not upon his personal experience, of which we know nothing. His wonderful experience makes good seasoning for his general dish, but is not a very palatable commodity when taken soning for his general dish, but is not a very palatable commodity when taken all alone. While I would be far from attacking Mr. Doolittle's reputation for truth, I still hold strongly to "reasons why," for proofs. I hope his attack on my motives was "a joke," and here let me say that I will do my very best to give him all he can attend to in any well meant discussion that he may enter well meant discussion that he may enter into, without taking time for "jokes."

Notwithstanding I make comb foundation to sell, that does not change the fact that that article, properly made and fact that that article, properly made and used, is becoming a staple—yes, is one now. The old and modern prices go to prove it. When I was experimenting with bogus foundation 4 and 5 years ago, and condemning the article (as Mr. D. is doing now). Prof. Cook and others predicted that I would be using and selling it soon. How correct that prediction was! I hand the same to him. I know the road, and know Mr. D. is "coming."

I find that the bees will draw out foundation so much faster than they can

foundation so much faster than they can foundation so much faster than they can secrete wax (to say nothing of the time of gathering the honey it is made from and the time spent in building it), that during the "rush" is just when we get most profit from its use. Foundation should (especially for boxes) have a thin base and soft line, then the septum of the combs from it will be like those of natural comb, and the line being soft (less in size than the cuts between the dies would take), the bees will make astonishing progress with it. Not one astonishing progress with it. Not one consumer in one thousand will ever notice anything bulky about the comb.

Is it true that the combination top and is a true that the combination top and side-storing system necessitates these sections? My method of adjusting sections admits of their removal separately "the moment one is finished," which Mr. Doolittle speaks of. But that advantage is more than off-set by the great amount of extra labor it requires to do that to the letter. There are certain times of the season when it is not of so much importance—when honey is coming in and combs are being finished up rapidly. I have no trouble in removing a single section, because I do not put the next section just where the full one came from, but shove the next fullone came from, but shove the next fullest up where the vacancy is, and so on, and put the new section (which is not empty, but full of comb foundation) down at the lean end of the row.

Mr. Doolittle's closing sentence in his article on separators, in the Weekly BEE JOURNAL of April 27, is worth more to me than all the rest of that article—my sentiments eventiments evently.

sentiments exactly.

1 construed Messrs. Greiner Bro.'s article as a disclaimer against tin separators as "compared with wood," and after carefully reading the article again, Lean place he other constructions. I can place no other construction upon it. I did not pursue the discussion for the sake of being "on the contrary side," but because my experience had proven I was correct, as I had faithfully tried wood pursue and matterial word proven in the contrary side," tried wood, paper and pasteboard, as well as lots of tin. I fail to discover any acrimonious feeling in any of the correspondence except their last letter, which was undoubtedly hastily written. Dowagiae, Mich., May 18, 1881.

For the American Bee Journal

### Bee-Keeping in the South.

A. F. MOON.

We are often asked if the South is a good location for successful bee-culture. There are locations where large yields of honey have been obtained. but such locations are not so desirable for living in, for they are generally near low lands. Northern Georgia is about low lands. low lands. Northern Georgia is about medium; in fact, it is about the same all over the State, with a few exceptions. all over the State, with a few exceptions. The main dependence for a large yield is honey dew. This in some seasons and in certain localities is very great. A gentleman, living 15 miles from this city, informed me yesterday that his bees had averaged about 75 lbs. to the colony during the past 10 days, while here none had been seen. This honey is about the color of the buckwheat honey of the North, but is very thick and rich, though sometimes a little strong, and in Eastern markets would be classed as second quality. But litbe classed as second quality. But lit-tle white clover or linden honey comes into market in this State, yet some fine honey is obtained. We have 2 months into market in this State, yet some fine honey is obtained. We have 2 months in which there is a great scarcity, that is July and August. I think this might be greatly counteracted by sowing buckwheat; although this plant is so greatly operated upon by climatic influence that some seasons it yields but little honey. Its growth in the South is entirely different from that in the

North. In the South it keeps up a continuous bloom from its commencing to blossom until fall, ripening and flower-ing at the same time, while in the North it ripens like wheat and other grains.

January I went into a flower pit that had been closed for some time; there were several rose-bushes in bloom, there were several rose-hushes in bloom, and, strange as it may appear, each one was covered with honey dew as plentifully as 1 ever saw it in the forest. Upon examining it I found the small buds were covered thick with the rose louse. There were nearly 200 plants besides the roses, in the pit, but no honey dew on one of them except the rose-bushes.

As to the South being a great honey

As to the South being a great honey eountry, I will say that it is about me-dium. There is one thing, however, that is very desirable besides the honey production, it is one of the finest climates that a person could wish to live in. We have good water and as kind and generous people as we ever wished to live with To our Northern friends, who so often write us about the South and her people let me say if you wish and her people, let me say, if you wish a quiet, peaceable home in the sunny South, you will find among the South-ern people a generous welcome; they know no South, East or West; all is peace and quietude, with law abiding people. Rome, Ga.

#### Upward or Lower Ventilation.

A. BENEDICT.

My experience is that bees require more ventilation in the winter, to be healthy, than at any other time in the vear; this should be only in one place. If the opening is at the top, the animal If the opening is at the top, the animal heat which is so essensial to the comfort of the bees, is continually escaping upwards. But if the ventilation is at the bottom of the hive only, the rarified heat would be retained, or have to make its way down, instead of up, to escape. It is a well known fact that bees stop every little crevice at the top of the hive. The little honey bee is wiser by instinct than man with his reason. The nearer we follow that instinct, the better success we will have with bees. To have lower and upward ventila-

To have lower and upward ventila-tion, both at the same time, is wrong. A cold current of air is constantly passing through such hives, and bees cannot breed up to full colonies, until settled warm weather comes.

A few years ago when so many bees died, I visited several apiaries, to see if I could discover the cause. I found one man that had lost all his bees; he had but I colony left. This was a box hive on 4 pieces of bricks, which left 2 inches all around for ventilation. The other 14 hives in which the bees had lied head only a produced to the bees had died, had only an ordinarily entrance ventilation. I examined some of the oned, had only an ordinarily entrance ventilation. I examined some of the hives and found the dead bees and combs wet and covered with mold. On examining the hive on the bricks, I found the combs entirely free from moisture or mold. I asked the man how long that hive had been there. the said for years; that it was one of his oldest colonies. (Moral: the laundress hangs her clothes out where there is a strong current of air, and they soon

is a strong current of air, and they soon dry, instead of hanging them in a damp cellar where there is no air stirring.) The late Dr. Kirtland of Cleveland, Ohio, one of the most noted bee-keepers in Northern Ohio, told me that one win-ter he lost all his bees but I colony, and that colony was in a box hive up in the forks of a tree. The bees had lit there, and it was difficult to dislodge them; he placed the hive over them and the he placed the live over them and the bees soon took possession of it. He said, just for the novelty of the thing, he fastened the hive securely to the tree with a trace chain, and let it remain. He said that these bees were no more protected from the cold than they would have been if the hive had been suspended to a limb of the tree, without any bettern.

hives in cellars is to remove the covers. and tie over the hive common cotton cloth; this keeps the bees and combs dry. To winter well, bees should be kept cool enough, so that they will keep clustered, not running around over the

combs.

The loss of bees in this section is about alike, whether in the cellar about alike, whether in the cellar packed with chaff, or without any protection. About 7-10 are dead; nearly all had sufficient honey to have carried them through the winter.

A widow living 3 miles from me had 5 colonies lest fall and there are now 3

5 colonies last fall, and there are now 3 alive and strong. They were in movable comb hives, and put flat on the ground where they were hived. The old dry weeds and grass around the hive indicated that the hives must have been nearly hid from sight last summer. How is that for winter packing?

Benington, Ohio.

#### How to Separate Swarms.

BRAY & SEACORD.

In the JOURNAL of April 20 we find the remarks of "E," of Kansas. In haste to reach the mail in time was the cause of the omission named. We will now give our plan with full particulars.

Make a box 3 feet long, wide and deep

Make a box 3 feet long, wide and deep enough to hang the frames in, from the hive you use; place the frames in the box, same spaces apart as they are in the movable comb hive; make one entrance for the bees on the side of the box, twice the length and of the same height as the entrance to the hive. Make 3 or 4 division boards to fit the box they make a cover with cleats on box, then make a cover with cleats on both sides (no end cleats) to fit the box; box; sides (no end cleats) to fit the box; hive the swarms of 2 or more in the box; place the box in the shade until the next morning, then bush the cover box; place the box in the shade that the next morning, then push the cover lengthwise of the box and you will see each colony clustered by themselves. Now, put a division board between each Now, put a division board between each cluster, after which push back cover over box and set it where you wish to hive the bees. Place the hive in a convenient position to receive the bees, push the box cover back from over the first cluster, carefully drawing out the frames from the box, for the bees build comb 21 hours or less from the time hived. On some of the frames you will find comb; place those frames with bees on, into your hive. This will start a roar in the hive; the balance of the bees can be removed with a feather. When all the bees are in the hive, place When all the bees are in the hive, place it where you wish it to stand, and proceed with other clusters in a similar manner.

laving tried the above plan frequently we know it works like a charm. I have received the Emerson binder for the Weekly BEE JOURNAL. It is complete; no bee-keeper can afford to be without one.

Warthan, Cal., April 29, 1881.

For the American Bee Journal.

Sundry Questions.

J. B. RUSSELL.

Please publish the following questions with answers for the benefit of myself and friends in the South:

1. If I confine my bees to a few combs, will I not lose the honey they put in the extra combs when they have

2. I notice that colonies left undisturbed have filled the outside frames with sealed boney, cast a swarm and stored a gallon of honey in cap already while those confined to a few frames in early spring, have cast no swarms, nor stored any surplus? Is it not reasona-ble to suppose that for this section, at least, it is best not to disturb bees, only so far as to see that they are increasing

daily, etc.?

3. If 1 did not have all of the brood filled with

combs for brood, and it is the same when I have many or few combs in the

Should I confine them to a few

combs and get less honey, as 1 have done? Wherein lies the fault? While 1 an satisfied that to get the largest yield of honey, or any surplus at all, you must have the brood chamber overflowing with bees and honey, my experience is that this is the sooner my experience is that this is the sooner accomplished by not altering their condition, as spring finds them, which with us, is with all their combs. And what puzzles me, is that Messrs Muth, Doolittle and others' experience is so different. There must be something in different. There must be something in my management, and if you can, from this letter, see what it is and give me an idea, I will try to work it out better, and see if I cannot get more than three or four gallons, which was my best yield last season.

Cuthbert, Ga., May 23, 1881.

[1. No; you can extract the honey from those combs, then give them back as fast as needed, or use them in colonies where feed is wanted.

2. In a mild climate, like that of Georgia, contraction of the brood chamber in winter and spring is not so essential as in the North, unless the colony is very weak.

3. With good colonies, you had better lift the sealed honey combs from the outside, put in division boards, and leave the brood chamber to the queen exclusively; if a good queen, but little honey will be stored below after your June harvest begins.

4. The fault is principally in not having spread the combs fast enough. If honey is coming in lively in early spring, and nights are warm, not to chill larvæ, a fresh comb should be added to the brood chamber at least each four days. If you contract too much, it is at the sacrifice either of bees or honey, for both cannot occupy the same cell at the same time.—ED.]

For the American Bee Journal.

#### Sugar Syrup for Wintering Bees.

A. A. E. WILBER.

On December 24, I put 20 colonies in the cellar, 4 of which had sugar syrup, and the remainder natural stores. I left 21 on summer stands, 3 having syrup. My cellar proving too cold for syrup. My cenar proving too cold for such a winter, the mercury at a few times falling as low as 26° above zero, and remaining 4 days at a time. After the first one of such cold spell, I could detcet the smell of dysentery upon going into the cellar, but I hoped they might have a fly soon, but a suitable day for that did not come till most of them had died. On April 8, I removed those from the cellar for the last time, only 3 remained out of the 20 I put in last December, and these were the 3 out last December, and these were the 3 out of 4 having sugar syrup; all those having natural stores, and 1 of those having sugar syrup, died with the dysentery. Out of the 21 left on summer stands, only 2 remained; 1 out of the 3 having sugar syrup, and 1 out of 18 having natural stores. Sugar syrup and cellar wintering are a little ahead; the two that died with syrup on sumnaving liadical scores. Sight syrup and cellar wintering are a little ahead; the two that died with syrup on summer stands, were the only ones that died without the dysentery. I can see now where I could have done better. If I had completed my cellar early and made it frost proof, given all my bees sugar syrup and put them in early, it would have been better; the cellar was not completed till after some zero weather, and when the hives were loosened from the stands, they came up with a heavy jar, which caused the bees to fill themselves with honey. I would like to hear from some one that feeds sugar syrup. I believe Mr. D. A. Jones recommends it. How has he succeeded in wintering his large appiaries? Fully 85 per cent, out of all the bees in this vicinity are dead, those packed in chaff vicinity are dead, those packed in chaff not being exempt. Kelloggsville, N. Y., May 21, 1881.

#### THOMAS C. NEWMAN,

EDITOR AND PROPRIETOR.

CHICAGO, ILL., JUNE 1, 1881.

#### Another Bee-Master Gone.

On May 2nd, at 8 a.m., Herrn Andreas Schmid, editor of the Bienen Zeitung, died at his residence in Eichstadt, Germany, aged 65 years, after a long and painful illness.

His name belongs to those illustrious ones, whose research, patient study and progressive thought, have given Germany the unquestioned first position in the theoretical department of scientific bee-culture.

While in Europe in 1879, we had the extreme pleasure of having a very interesting conversation with the illustrious departed, having been introduced to him, by the Baroness, widow of that late celebrated apiarist, the Baron of Berlepisch. At that time we exchanged photographs, and from the one he then placed in our hands, we have had the accompanying engraving made, and now present it to our readers:

Herrn Andreas Schmid.

Little did we then think that of all the noted apiarists present at that Congress, he would be the first to be cut down by the all-devouring scythe of time, which without distinction sweeps away the rich as well as the poor, the learned as well as the ignorant, and the savant as well as the peasant.

Never again do we expect to behold such a scene as we witnessed at that honorable Congress of Austria and Germany. There, though we had hired an interpreter to assist us in conversation, that estimable lady, the Baroness of Berlepsch, escorted us around, and personally introduced us to the leading apiarists of the World, who were in attendance at that Congress-among whom were the late Herrn Schmid, the Rev. Dr. Dzierzon, Herrn Emil Hilbert, Prof. Dr. Butlerow, of Russia, (who was the bearer of authority from the late Czar of Russia, to confer the order of Santa Anna upon the eminent Rev. Dr. Dzierzon), Prof. Louis Ritter Von Sartori, of Milan, Italy, Herrn Vogel, Herrn Karl Gatter, editor of the Bienen Pater, at Vienna, Count Kotowrat, Otto Schultz, and many other celebrities, who seemed knit together in shall never forget the parting scenes, tion for the advancement of science.

when many a kiss of affection was exchanged, accompanied by the parting

It is now 37 years since the Bienen Zeitung was started. It is the oldest Bee Paper in the World, and is published semi-monthly. Among its valued correspondents, has been numbered the Rev. Dr. Dzierzon, the late Baron Von Berlepsch, of Coburg, Prof. Von Siebold, Prof. Leuckart, Dr. Donhoff, Dr. Kuchenmeister, Pastor Kleine, Pastor Schonfeld, Herrn Vogel, Dathe Rothe, Count Von Stosch, whose names are among the illustrious apiarists of the 19th Century.

It must be admitted that the Germans bear off the palm, for all the great advances in the theoretical knowledge of the bees, made for a generation past, have come from them.

The following is from the pen of the late Samuel Wagner, our worthy predecessor, and will be read with interest as a part of the history connected with the late departed:

In the earlier part of its career, the German Bienen Zeitung had to contend with difficulties. Bee culture had long study in Germany. Various theories had been framed, to explain the mysteries which its advocates recognized as existing; and the authors and adherents of these several theories, clung foundly to their preconceived notions. defending them oft with intemperate ardor. So long as it seemed conceded that anyone of these theories might be true, and all of them were treated with equal defference, the Bicara Zeitung moved along smoothly. But when Dzierzon advanced his new theory, though modestly submitting it at first in the form of an hypothesis, a different state of affairs ensued. The old schools felt intuitively that if this new doctrine be true, it involved the subversion and repudiation of all the subsisting theo-It was at once made an object of attack from all quarters; and a violent controversy, not unmixed with acrimonions personalities, followed. Dzierzon nions personanties, followed. Dzierzon defended his theory with great dialectic skill, for which his training and large experience in bee culture eminently qualified him. Then turning on his resultants to expend their follows. entry quamer mm. There exists assailants, he exposed their fallacies and the inconsistency of their views, and arrayed against them views, and arrayed against them the evidence of incontrovertible facts. Some of the old correspondents of the Some of the old correspondents of the Bienen Zeitung began to complain and remonstrate, and finally many of them withdrew. But the truth was rapidly with a reward of the truth was rapidly making converts on every hand; and when Berlepsch, who had vauntingly denounced the new theory, proclaimed his conversion; and Kleine Orttel, and other distinguished apiarists became its advocates, a new and highly intelligent corps of contributors soon made amends for the defection. The impartial course for the defection. of the Bienen Zeitung, pending the con-troversy, was acknowledged; its policy vindicated; and, in its speciality, it now enjoys universal esteem.

Mr. D. A. Jones reports that Apis Dorsata has been found in Ared. We shall be able to give our readers the full particulars soon.

Farmers in central Illinois report winter wheat suffering from the chinchbug and Hessian fly. Thousands of acres are being plowed up to plant corn. Bee-keepers are not the only ones having disasters.

The Annual Meeting of the Society for the promotion of Agricultural Science will be at Cincinnati, on Tuesday, Aug. 16, 1881, the day preceding the closest bonds of affection. We the sessions of the American Associa-

#### The Honey Market for 1881.

Although it may be premature, at this time, to hazard conjectures regarding the incoming crop and the prices likely to govern the market, yet we feel that bee-keepers cannot too soon reatize the situation, and take advantage of every circumstance which may be made to contribute to their prosperity. We see, as vet, no reason to amend our auguries regarding the favorableness of the season and the bountiful honey flow in all the States east of the Rocky Mountain range, and the heavy harvest and remunerative prices which will be realized by those who have escaped disaster, or who may be wise enough to replenish their winter losses before basswood bloom puts in its appearance.

Reports are very encouraging from all quarters, and more especially from most of those districts where last season the honey yield was least encouraging. Up to this time the weather, since the late advent of spring, has been most propitious, and colonies have built up with marvelous rapidity. In most of the Southern States the honey yield has already been unusually gratifying, and the prospect is good for several weeks' duration. In all the Northern and Central States the showing was never better for a heavy summer harvest, and with seasonable rains and favorable winds, we may expect results that will astonish the most sanguine, and of a quality that will prove the superiority of American honey.

In California, however, the prospect is anything but encouraging. Recent advices, both public and private, from San Diego, Santa Barbara, San Bernardino, Los Angetes and Ventura counties, are of a somewhat discouraging nature. The blossom of the white sage, relied on for the lightest cotored and finest flavored honey, is said to be a failure in many localities. This, in addition to the fact that the California market was about depleted of last season's crop, leaves but little to be forwarded for our home markets, thus putting the price under the control of our home producers.

However abundant the yield may be. there need be no fear of an over-stocked market. There never has been much attention paid to scientific bee-keeping in the Southern States, and, of course, but little honey on the market from there, so that however abundant their yield may be this season, it will not approximate anything nighthe shortage which will occur in the Northern yield in consequence of the loss of bees last winter. Honey has become a staple. and now that the old fogy producers were pretty welt "frozen out" of the business last winter, we cannot imagine why this season would not be a favorable time for establishing a staple price. Why should not our locat, district, State and National Societies take this matter up, and discuss it in their Conventions? Would it not be well to estimate the average cost of production, reckoning also the hazard, then after adding a reasonably liberal percentage for profit, fix a staple price for our commodity? We fail to recognize any other business of one-half the magnitude of the beekeeping interest, wherein the producer has not at least a voice in fixing the price he is to receive, or calculate about the gross receipts on a certain amount of business transacted. We take this

occasion to advise our readers not to be in too great haste about forcing a market. Europe will not produce enough honey this season for local consumption, and the foreign shipments from California will be comparatively light, therefore those who may have any to sell can, if they will, get good prices.

From a San Francisco price list of recent date, we clip the following comparative statement of transactions during the past three years:

The number of cases of comb honey received were: 1878, 38,337; 1879, 8,443; 1880, 26,782. In addition to the receipts or 1880, there arrived 1,156 bbls, and 126 cegs. There was also considerable exkegs. ported overland, and by sea direct, from Southern Coast points, the exact amount of which there is no data at hand.

Exports for the past three years from San Francisco, Sacramento and San Jose have been:

By Sea from San Francisco.		By Rail from S.F. & interior.
Cases.	Lbs.	Lbs.
1878 4,978	518,714	1,254,989
1879 13,675		214,216
1880 7,890	150,806	861,050

Of last year's shipments overland, 720,690 lbs. were sent from San Francisco, and 140,360 lbs. from Sacramento and co, and 140,360 lbs. from Sacramento and San Jose. Receipts since January 1st, 1881, to date, 3,865 cases, 272 bbls., 49 kegs. Exports by sea for same time, 4,432 cases, 199 bbls.; by rail, exclusive of May shipments, 119,190 lbs. from San Francisco, and 34,530 lbs. from the interior. From Wilmington direct there were shipped to Europe last month 139 cases.

We were requested to write a synopsis of the lecture we delivered at Lansing, before the Central Michigan Bee-keepers' Convention, and incorporate it into the minutes. We have been too busy to do so, and must ask pardon for its omission.

#### MISCELLANEOUS.

Queen Bees Sent by Mail.-Mrs. L. Harrison, in the Prairie Farmer, gives the following cautions to careless shipners:

Queen bees have been sent by express and through the mails for years. Through the carelessness of some breeders, who forwarded them in bad shape so that the officials were stung and the contents of the mail pouch made sticky by the teakage of honey, an order was issued forbidding them to be sent by mail. But by the intercession of some prominent entomologists and apiarists the Post Master General last year agreed to consider them mail-able matter, so long as the officials were not stung or the mail soiled with were not still or the man solice was boney. The requirements were, that the bees were to be covered with two thicknesses of wire cloth, and that no tiquid sweets were to be in the cage. Queen bees are now sent in the mail confully to the most remote settlements. safely to the most remote settlements.

The Bee Catcher.—In the Farmer's Home Journal we find the following description of the red bird which destroys bees as found in "Audubon's Birds of America:"

SUMMER RED BIRD-(Tanagra Œstiva).-Adult male, the whole plnmage is vermillion, brighter on the lower parts, excepting the tips and inner webs of the quilts, which are tinged with brown. Length 7½ inches; extent of wings 11 inches. It is migratory from Texas to Massachusetts, and especially abundant in the interior of Canada.

Adult female, the general color is light brownish-green, the sides of the head and under parts generally brown-

ish-yellow; quills deep brown, externally margined with yellowish-red.

This species feeds principally on insects, and especially coleoptera, some of which are often of a larger size than a bird of the dimensions of the summer a bird of the dimensions of the summer red bird might be supposed capable of swallowing. It seldom alights on the ground, but prefers pursuing insects on the wing, which it frequently does from the dried twigs at the extremity of the branches.

A subscriber gives further light on

the subject, to-wit:

have just been reading your valuable paper, and see among other things, a question asked by a correspondent for a question asked by a correspondent tor the name of a red bird that has been destroying his bees. I suppose it is the same bird that I have been troubled with ever since I have been raising bees. I think it is the same bird that orni-thologists call the fire bird, from his brilliant red. I have known him to be a destroyer of bees for years, and con-sequently declared unceasing warfare against him. My boy says they are more numerous this season than ever against him. My boy says they are more numerous this season than ever known. They only eat the thorax, then leave the abdomen of the bee. Our greatest trouble in bee-keeping is from birds.

WM. W. B. Elizabethtown, Ky., May 7, 1881.

The Season in Indiana. -Mr. Frank L. Dongherty, in the Indiana Farmer,

With us fruit bloom has come and gone. We are now in the midst of the honey dearth between fruit bloom and honey dearth between fruit bloom and white clover, the latter of which is beginning to make appearance, although as yet it contains no honey. The bees must be watched now, so as not to allow them to run out of stores. The queen should be kept laying to her full capacity, for it is on the bees raised this month that we must depend for ony main honey gron. In an aniary raised this month that we must depend for our main honey crop. In an apiary of only a few colonies, seemingly in the same condition, we find some colonies will far outstrip others in brood-rear-ing, consequently for the best results we are compelled to take from the strong to assist the weak. Examine all the colonies, mark their condition, re-moving frames of broad and bees from moving frames of brood and bees from those that can spare them and give to those that can spare them and give to the weaker ones, thereby putting them in better condition for the honey yield when it comes. If this work be done in the middle of the day but very few of the bees removed will return to the parent colony, as at that time most of the old bees are in the fields at work. When 2 or 3 frames are given at one time it is better to take them from sevtime it is better to take them from several hives, for by thus mixing them up they are less liable to injure the queen. In manipulations of this kind it is always best to ascertain the whereabouts of the queen, so as not to remove her from the hive.

Selling Bees by the Pound.-Mrs. Harrison remarks as follows on this subject in the Prairie Farmer:

A new industry has lately been developed, viz: that of selling bees by the pound. They are sent by express of light wood. Little feeding troughs, in which candy is poured in a liquid state, which hardens on becoming cool, are fastened in each end of the cage. In these cages bees can be sent long distances safely and cheaply.

During the last almost unprecedently cold winter, many persons in the North and West lost all their bees, and yet cold winter, many persons in the North and West lost all their bees, and yet have 34 of their investment in the hives and combs remaining. It would be better for those who have lost their bees to purchase a queen and bees by the pound, than let the moth-worms destroy the comb. We received bees by express (sent in the way described) restricted withing them on combs given yesterday, putting them on combs, giv yesterday, putting them on combs, giving also a frame of uncapped brood and honey, and to-day (May 18) they are working like beavers. Bees are being shipped from Texas, Alabama, and other Southern States to the North. The bees were not destroyed by "blizzards" there, and are now at the swarming point.

Loss by Fire.—Last month my house was burnt. I lost all of my BEE JOURwas burnt. I lost all of my BEE JOUR-NALS, honey extractor, over 700 lbs, of honey, and a lot of apiarian supplies. My bees gave but little surplus last year, and many died with dysentery early in the winter. Some were in the cellar and some packed in chaff on the summer stands; those left are now doing well. E. J. ROCKEFELLOW. Farragut, lowa, May 25, 1881.

Bee Losses in Virginia.—As near as I can learn the losses in Virginia among bees are about as heavy as in the North My losses were less than 10 and West. My losses were less than 10 per cent, wintering on summer stands with chaff above. The first natural swarm issued May 2, unexpectedly, as I do not allow much swarming when attending the bees. Our season has begun handsomely. One hive kept on the scales gained 17 lbs. on the 15th, and table with a label of the stain full true start. 10 lbs. on the 10th. It is in full two stories. The locust bloom was very abundant; the Liriodendron is now blooming. I can get heavier work with the full size wide frames, holding 6 sections,  $4\frac{1}{4}x5\frac{2}{3}$  in them, with clamps. I use both; but it is fun to compel bees to work above, by lifting brood up and placing wide frames between. Besides there cannot be too many bees, for one can put on a third story, as I have done till they could ripen and seal. It was in that way I got my heaviest yield last year, 96 sections filled from one hive. As the Cyprian and Palestine bees are coming into notice, I wish to suggest a better name for the latter. The Holy Land bee and Holy bee, (as some shorten it), is hardly the thing. Why not call them the Palestine bee?

Hi it proves of value, it must have a name. J. W. Porter. Charlottesville, Va., May 23, 1881.

[That is precisely what the BEE JOUR-NAL has been calling them for some time. Syrian may perhaps be still better. At all events, to call them "Holy Bees" is not the correct thing.—ED.]

Bees in Texas. - Bees in this locality are doing well; the prospects for a good honey crop are rather flattering. We have 80 colonies, about <sup>1</sup>2 are Italians, the others are blacks. We secured no surplus of any consequence from black-bees last season. We give the Italians the preference in all respects.

FLOURNOY & FOSTER.
San Antonio, Texas, May 20, 1881.

Does not want to Winter in Cellars.— I wintered my bees packed in chaff on their summer stands. I put into win-ter quarters 36 colonies and lost 9 by starvation, and one became queenless, which I wintered with another, leaving 26 colonies; 5 are rather weak, but are coming on finely. Drones commenced to fly yesterday. The first pollen was brought in April 19. No cellar wintering for me. ing for me. J. Cu Home, Mich., May 19, 1881.

How Bees have Wintered in Ontario.—I have been so "stiddy to hum" this spring, owing to my having a new place to fix up, that I have hardly been out among the bee-keepers at all. The echo of many sighs and groans has reached me however, and while I cannot give the percentage of mortality I am convinced that the winter of 1880 8t has been a disastrous one for beest has been a disastrous one for bee-keeping in Ontario, as in most regions of the North American continent. "Old style" bee-keepers are pretty well cleaned out, and not a few intelligent and up-to-the-times bee-keepers are in and up-to-the-times bee-keepers are in the same predicament. Mr. Ravel, the best practical apiarist in my locality, put into winter quarters 45 colonies, and in view of the misfortunes of others, blesses his lucky stars that he has 10 left. I don't know how Mr. Jones has succeeded. Does any body but himself? In his correspondence with me be says nothing as to winter.

many others. WM. F. Cl. Listowel, Out., May 12, 1881.

No Surplus Honey.—Judging from present indications this county will produce little or no surplus honey.

John S. Calkins. Los Angeles, Cal., May 15, 1881.

Robinia Viscosia. -- I would like to inquire if you know anything of the value, as a honey-producing tree, of *Robinia Viscosia*—clammy locust. I have been told that the bees are very fond of it, and work upon it in great numbers while in bloom. Arthur Bryant, Sr., in his work upon forest trees, states that it sometimes blooms twice during the season. As it comes into bloom before the clovers, and is valuable for timber, and if which the worthy and of rapid growth, it might be worthy of cultivation by the apiarist, it its value as a good honey-producer is established. It is a beautiful ornamental tree.

D. P. Norron.
Council Grove, Kan., May 19, 1881.

[Will some of our readers who are familiar with this tree, please give the desired information ?-ED.}

Honey Season in England .- We are asterly winds, so that the bees have to be fed. We seldom expect a flow of honey till June has really set in, for 9 times out of 10 the spring is too cold for the bees to do any good on the fruit blossoms. Our first good crop is the yellow trefoil, or "none-such," which is in full bloom by the end of May.

SAMUEL SIMMINS.

Ruttingdean, England, May 11, 1881.

Bees for Pleasure.—I keep a few bees or the pleasure derived therefrom, and they never were so strong and doing so well at this season of the year as they are at present. White clover is beginning to bloom, and locust bloom is just passing away. We will soon have a profusion of European linden bloom.

H. H. LITTELL. Louisville, Ky., May 20, 1881.

Losses in Winnebago Co., III.—An apiary of 2 colonies is what I had; I apiary of 2 colonies is what I had; I wintered them on the summer stands, packed in straw and chaff, and they starved to death. C. has 21 out of 40; II. 16 out of 46; both wintered in a house. S. has 22 out of 325; G. has 16 out of 16; M. has 6 out of 6; A. has 5 out of 5; A. has 22 out of 32; these all wintered in the cellar. M. has 1 out of 14; these were out-of-doors without protection. These are nearly all practical bee-keepers, and there are a good tical bee-keepers, and there are a good many farmers in this vicinity who had last fall from 1 to 10 colonies, but nearly all are now dead. I wish I could get the BEE JOURNAL twice a week, or even daily. D. L. WHITNEY. Rockton, Ill., May 26, 1881.

King-birds, Drones, etc.-1 notice the Bee Journal for May 18 an article about king-birds, in which the opinion is expressed that they catch workers as well as queens and drones. My opinion is that they catch workers alone for the honey in the sac; I have noticed them station themselves near the hives on some dead limb of a tree and dart out and catch the heavy laden ones as they approached their homes. I have also frequently noticed them perched on the dead weeds in the midst of a white the dead weeds in the midst of a white clover field, and when a loaded bee started to go home the king-bird would dart out and gobble him up. I have also noticed the pieces fall, as though the bird had cut them in two, to swallow the part containing the honey At a néighbor's honse one day At a neighbor's house one day I noticed one of those birds perch himself on the dead limb of a peach tree, near 3 colonies of bees. I asked my neighbor why he did not kill the bird; it was eating his best worker bees. He said: "I reckon not." At that moment it

grave. Perhaps no news is good news; his boys to get the gun, and whilst he I hope so; but I would like to have him "rise and explain" how those 1,000 colles, each time getting something. He onies of his have fared during the shot it, cut it open and found 3 bees, nuprecedented winter we have just freshly swallowed. I encourage all around me to kill all they can, and kill many others.

WM. F. CLARKE.
Listowel Out May P. 1881. shot it, cut it open and found 3 bees, freshly swallowed. I encourage all around me to kill all they can, and kill all that come near me. Others should do so, foo. I do not know whether all that come near me. Others should do so, too. I do not know whether do so, too. I do not know whether drones and queens have honey sacs or not, or if the food they take goes direct to the stomach. If they have no honey sac the king-bird will not catch them. Long live the BEE JOURNAL and its genial editor. G. W. ASHBY. Valley Station, Ky., May 25, 1881.

> Origin of the Italian Bee.—The prevailing enthusiasm among bee-keepers concerning the different races of bees has, no doubt, induced an investigation has, no doubt, induced an investigation concerning the origin of the Italian race of bees. Some suppose them to be a cross between the Palestines and black bees; I do not, however. What evidence is there that the "saddles" on the Cyprian bees are a distinctive mark? There is a certain insect of the beetle race, found on the Island of Madagascar in great numbers, which Madagascar in great numbers, which live on the nectar of plants, which have a very long neck; the plants are peculiar and require this feature in the beetles to obtain the nectar. These beetles are found on other islands, but have no such peculiarity, showing that the nature of the insect must comply with nature of the fusect must comply with the requirements of the plant or it could not subsist. In many other instances similar changes have occurred in this insect, as shown in natural history. The talian and Cyprian races may be the same—one generation may not have perfected the Italian race; it may have taken ages. One common trait is still found to correspond with all other insects which will never be wholly extinguished.

Loss 15 per Cent.-My bees wintered with a loss of 15 per cent. principally by starvation, by not being properly prepared for so severe a winter.

John F. Egoleston.

Eagle, Pa., May 24, 1881.

Experiments in Wintering Bees.—My loss in wintering was 7 out of 69, but I have lost two more since, by being robbed. My Italians stands the winter the best. One colony I wintered on its summer stand in a chaff hive; they are doing well. I wintered in a bee-house. doing well. I wintered in a bee-house; there were put in 59 colonies the day before winter set in. The house was dry, dark, and in a uniform temperature, ranging from 42° to 50°; no artificial heat used. The wall, 2 feet thick, was fally with say that and continued cial heat used. The wall, 2 feet thick, was filled with sawdust, and ventilated in under the floor and up through the ceiling and roof. They were taken out April 14, and 3 of the colonies were dead. Nine were put in the cellar about the same time the others were put in, and taken out about April 10; 4 of them were dead. The temperature of the cellar was too cold, (below 30°), about 15° colder than the bee-house.

J. H. HEARD. Flesherton, Ont., May 17, 1881.

Why the Defective Wings?—I have a colony that I believe will be ruined. A large amount of defective brood is carried out and some apparently perfect, which cannot the but crawl all over the ground by hundreds. There is no sign of moth in the combs, and the queen is a tine looking one and fast layer. I see nothing wrong inside except the brood, a large amount of which is pipped (uncapped). The bees were shipped by rail a large amount of which is pipped (incapped). The bees were shipped by rail 60 or 70 miles, 10 days ago, but came all right so far as I could judge. Two other colonies are similarly affected, but not so bad; in the fourth hive but few of the drones can fly, but the workers seem all right. PETER JAMES. Waveland, Ind., May 23, 1881.

[The bees did not have ventilation enough when moved, which softened the combs and the outer ends of the eells were distorted, thus killing or deforming the young bees. With a very sharp knife shave off the surfaces of the but himself? In his correspondence with me, he says nothing as to winter-ing. On that point he is silent as the back in the same place. He told one of land it may remedy the trouble.—Ed.] combs where there is not sealed brood,

#### South East Michigan Convention.

An adjourned meeting of the South An adjourned meeting of the South Eastern Michigan Bee-Keepers Assoc-iation conveneed in the Court House at Ann Arbor, on Thursday, May 12, at 9 a. m. The meeting was called to order by the President. The Secretary being absent, G. G. Pease was chosen Secreabsent, G. G. Pease was chosen Secretary pro tem. The attendance was not tary pro tem. The attendance was not as large as was expected, on account of the busy season, and the discourage-ment attendant on wintering. The best method of wintering was the principal subject of discusion. Heavy losses were reported.

Mr. Douglas had only 5 left out of 29 in the Langstroth hive.

Mr. Ashley did not know what was the best method. Of 72 colonies last full, only 10 were now alive; he thought the box hives had shown the best results.
Mr. Gooddell had 4 in Gallup simplic

ity hives, put up in straw and chaff, which went through safely. Mr. Bennett had only lost 18 out of 68

colonies of Italians in Langstroth hives

colonies of Italians in Langstroth hives in the cellar.

Mr. Bodwell had 41; some in simplicity and some in box hives; 15 came through, but they had dwindled since.

Mr. J. Hick saved 11 out of 16.

Mr. Pease had 4 colonies of Italians in Gallup simplicity hives on the summer stands, which came through in fine order. They were realered with eight faul. order; they were packed with chaff and straw.

N. A. Prudden had 42 in the fall, 5 in chaff hives of his own construction and order. Out of 18 put in the cellar November 6, not taken out until April 6, 2 starved; the rest came through 6, 2 starved; the rest came through safely. He packed 15 on the summer stands with more loss. His 4 tenement hives packed in chaff all around the outside, come through in fine condition; he saved 30 out of 42 in all. Hives, 10 to 12 frame Gallup simplicity.

Hives, 10 to 12 frame Gallup simplicity.
Others lost heavily, one 40 out of 70;
another 20 out of 30; several lost all in
box hives. The per cent. of loss is
about 75 per cent. No general agreement as to the best method of wintering was arrived at. The subject of
importing bees was discussed, and
decided that further importation of Italing startly of weart was averaged. ian stock at present was unnecessary, as the Italians we now have are better than imported stock.

A committee, consisting of N. A. Prudden, N. Eastwood, L. W. Bodwell, G. G. Pease and R. Gooddell, were appointed to recommend a proper person for the office of commissioner on foul brood, in accordance with the recent act of the legislature.

The time and place for holding the next meeting was discussed at length. Some desired a union with the Eastern Michigan Association at Detroit; and others favored a meeting at Jackson, sometime during the State Fair. The matter was finally left to the decision of the executive committee, N. A.

Prudden, G. G. Pease and R. Gooddell.
To the Bee-Keepers of Jackson and
other parts of the district, I would say:
Take the matter into consideration and correspond with me, and see if we cannot have a meeting at that time, and choose officers for another year. Let us hear from the bee-keepers of Jack-

son in particular.

N. A. PRUDDEN Pres.,
and Chairman of Com.
(Michigan Farmer please copy.)

From the Michigan Farmer.

#### Coopersville Michigan Convention.

A meeting of bee-keepers was held at Coopersville, Mich., lately, with J. J. Robinson as Chairman, and Dr. E. P. Cummings as Secretary. Dr. Walling, who was called upon to state the condiing and considered it nothing more nor less than a cellar, with the disadvanta manner that he thought foul brood among our bees was caused by a specific poison of a zymotic character, arising from dead bees, broods, and in answer that he thought foul brood among our bees was caused by a specific poison of a zymotic character, arising from dead bees, broods, and in answer that he thought foul brood among our bees was caused by a specific poison of a zymotic character, arising from dead bees, broods, and in an an considered it nothing more nor listed to include the disadvantation. In the disadvantation is the contege, as philished on page t55 of the Weekly Brooks and the Contege, as philished on page t55 of the Weekly Brooks and the Contege, as philished on page t55 of the Weekly Brooks are disadvantation. The Professor gave some experiments of the same method made at the College, and thought Mr. Brown's experiments of the Senate and mover of the famour method made at the College.

uncleanly surroundings which under suitable putrifying conditions propagate a specific poison, sporadic in character, which is undoubtedly transferred to healthy bees after plunder. The remedy must be something to destroy the spores and antizymic in its character. When bad, destroy the hive and its contents. Mr. Robinson remarked that he had great confidence in the virtue of salicylic acid as a remedy. Mr. Harling believed that what they called feel be believed that what they called feel to be salicylic. Harling believed that what they called foul brood was dead brood; being exposed by swarming, the bees not being able to keep the brood warm, it died, became putrid and they called it foul brood. Mr. A. A. Dodge said he had seen the real disease and that it was a very different thing; very offensive to the smell and a mass of putrification and contagrant. cation and contagion.

#### Central Michigan Convention.

The Central Michigan Bee-Keepers Association held its sixth annual session in the Pioneer Rooms of the Capitol building, at Lansing, on May 5, 1881. The day was pleasant and the attendance was large. For some time it had been announced that Thos. G. Newman, heen announced that Thos. G. Newman, the gentlemanly editor of the AMERICAN BEE JOURNAL, would be present and deliver one of his instructive lectures; in addition to this, Prof. Cook. of the State Agricultural College, was to give an address on wintering bees.

At 9:30 a. m. Mr. Geo. L. Perry, the At 9:30 a. m. Mr. Geo. L. Perry, the Secretary of the Association, escorted Mr. Newman from the Michigan Central depot to the Chapman House. After breakfast they went to the Capitol building, where Mr. Newman was formally received by Rev. W. J. Asworth, President, and other members of the Association.

Association.
At 10 a. m. President Ashworth Association.
At 10 a. m. President Ashworth called the meeting to order, and made a few well chosen remarks, reviewing the history of the Association for the past 6 years, giving the contrasts between the first and the present year, and pointing out the many benefits derived from and the pleasure regelyed in rived from, and the pleasure received in the prudent management of the apiary. He mentioned our distinguished visitor and gave him the following introduc-tion: Ladies and gentlemen. I have the honor and pleasure of introducing to you Mr. Newman, of BEE JOURNAL fame.

This occasioned loud and continued applause. A large number of Senators were present who favored the passing of the Root Adulteration Bill (a bill to or the Root Adulteration of food now be-fore the Legislature), and understand-ing that Mr. Newman was the "Chicago man" that "so energetically opposed man 7 that "so energetically opposed the adulteration of honey with glucose," they had a little cheer of their own. Following this was the usual proceed-ings of conventions, viz: Secretary and

Treasurer's report, election of officers for the ensuing year, appointing committees of inspection, etc.

Mr. Baker moved that the President

call for wintering reports, and requested the Secretary to report them in the minutes

Prof. Cook then entered the room and brought with him his usual amount of

brought with him his usual amount of good feeling and advice.

Mr. Brown described how he had buried 11 colonies, similar to the method that farmers bury potatoes, but with more care. Mr. Brown states that he gave npward ventilation by the use of tile, that his loss was but 2, and that his confidence in this method sufficient to induce him to try it next winter. ins confidence in this method sufficient to induce him to try it next winter. He gave this plan at the State Conven-tion last fall, which was looked upon with doubt by Prof. Cook, T. F. Bing-ham and James Harper. His stateham and James Harper. His statement of success caused some further in-

quiry.

Mr. Newman said it was a similar plan to that recommended by Mr. Quinby. It was successful some windrated cantion.

Quinby. It was successful some win-ters, but he advised caution.

Prof. Cook said he had made careful experiments in this method of winter-ing and considered it nothing more nor

Mr. Robinson, of Pewamo, one of the largest bee-keepers in Michigan, said he had wintered over 200 colonies in a beehouse at his home apiary, a large number at his branch apiary, and had com-paratively little loss; he thought much of the loss in bees resulted from neglect

in preparing them for winter.

Mr. Baker described his method of successfully wintering in the cellar, as

did many others.

Mr. C. Case, of Eagle, showed the best record of any one present, having made a fall count of 65 and only lost 4 in winter. Mr. Case is a thoroughly m whiter. Mr. case is a thoroughly practical bee-keeper and devotes his whole time to his bees. He wintered in a single-walled hive, in a dry cellar well ventilated, and kept it perfectly

Mr. C. E. Waldo, of Grand Ledge, Mr. C. E. Waldo, of Grand Leage, lost  $\frac{2}{3}$  of 86 colonies. He had tried cellar and out-door packing; he also had a number in chaff hives. His loss was about the same by the 3 methods. Mr. Waldo considered the long confinement the gauge of least in winter for he had the cause of loss in winter, for he had

the cause of loss in whiter, for he had taken every means to save his bees.

Mr. Geo. L. Perry, the only one in this vicinity that makes a special use of the chaff hive, had only 13 left out of 43 last full. He considered the chaff hive all that is claimed for it, viz: that it will have been from forcing for he it will keep bees from freezing, for he lost no bees until March 20; he had a cider mill within 60 rods of his apiary, and the bees worked on the pomace for 10 days, and had much sour honey in the combs gathered after packing for

Many others spoke of their wintering, but all gave statements of 50 per

cent. loss.

Prof. Cook gave the college report; 10 were put in the cellar and only 5 are now alive; 4 packed in one foot of straw, all dead; one in Shuck hive,

Mr. Newman said that he had made a Mr. Newman said that he had made a thorough canvass from his large correspondence, from Maine to California, and the loss was 50 per cent all over the Northern States. Michigan and Illinois reports were not more favorable than Kansas or New York; it is only than Kansas or New 1 ork; it is only one of the adversities common to any business. As the prospect is flat-tering for a good honey yield, the few bees left will be likely to gather more any business. honey this year than the many did last season.

The Secretary, having made the canvass of the Convention, found that out vass of the Convention, found that out of 743 colonies shut up last fall only 238 are reported alive, and many of them weak and not out of danger. Many old bee-keepers that have grown gray in the science said that the last winter was the worst they ever knew. All but one said that the long confinement was the cause of their losses, and he (worst follow), said, he used 25 shorts of the confinement was the cause of their losses, and he (poor fellow) said he used 2 sheets of foundation and knew that the patent stuff killed his bees.

The meeting then adjourned to give

time for the examination of the num-erous exhibits.

erous exhibits.

The afternoon session was even more interesting than the morning; many citizens came in. Several of the leading papers of the State were represented, and a large number of ladies were present. After calling to order, the Association was entertained by an address from Mr. Newman. His subject, selected by the Association, was: "The rise, progress, present condition and future prospect of American Apiculture." Mr. Newman spoke extemporaneously, and delivered an address in his usual free and sprightly manner, interweaving occasional wit, manner, interweaving occasional wit. sufficient to command applause.

sufficient to command applause.

The following were unanimously elected officers for the ensuing year: President, Rev. J. W. Ashworth; Vice Presidents: Eaton Co., C. E. Waldo; Ingham Co., James Harper; Clinton Co., C. Case; Shiawasse Co., L. P. Bailey; Livingston Co., W. K. Cole; Calhoun Co., B. Salisbury; Jackson Co., C. B. Smith; Secretary, George L. Perry; Treasurer, L. B. Baker.

Prof. A. J. Cook read the essay on wintering bdes at the College, as imb-

wintering bdes at the College, as published on page 155 of the Weekly Bee JOURNAL. After closing his remarks Prof. Cook invited Dr. Root, member of the Senate and mover of the famous "Michigan Adulteration Bill," to tavor

Dr. Root, in a slow and easy manner. Dr. Root, in a slow and easy manner, made some fitting remarks on the science of apiculture, and the rights of bee-keepers generally. Finally, touching the subject of adulteration, he warmed up to that quick, positive tone and expression that so characterizes his speeches on the floor of the Senate.

The Convention next listened to some timely remarks by Mr. Robinson, of Pewano, giving his methods of management of bees in his extensive varias

agement of bees in his extensive yards, and advice concerning the care of

combs and comb honey.

After some further remarks by memhers present the President declared the "question drawer" open, and appointed Messrs. Newman, Cook and Harper a committee to answer the questions. Many of the usual questions were asked and many be intelligence imported by their and much intelligence imported by their

answers.

The exhibit of the hives and supplies The exhibit of the hives and supplies was quite large; a chaff hive from Ill. was there, but owing to the many parts it contained found but little favor. Bingham's smoker was as usual the "pet." Time was given to examine the books and publications on exhibibition. Mr. Brown, of Lansing, exhibited a section machine and foundation fastener. Mr. Newlyrow a clamp to

tion fastener; Mr. Newbrowa clamp to raise frames from the hive.

After being called to order, Mr. Case, of Eagle, offered resolutions in honor

of Messys, Newman and Senator Root; both gentleman were elected honorary members of the Society. On motion, the Convention adjourned to Oct. 27.

REV. J. ASHWORTH, Pres.
GEO. PERRY, Sec.

#### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

#### CHICAGO.

HONEY The market is plentifully supplied with honey, and sales are slow at weak, easy prices. Quotable at 150418c, for strictly choice white comb in 1 and 2 lb.boxes; at 150512c, for columna dark-colored and broken lots. Extracted, 7556045c, tark, 15@17.

## Books for Bee-Keepers.

Sent by mail, postpaid, on receipt of price, by THOMAS C. NEWMAN.

974 West Madison Street, CllicaGO, ILL.

Conk's Manual of the Aplary.—Entirely rewritten, greatly enlarred and elevantly Illustrated, and is fully ap with the times on every conceivable subject that interests the aplarist. It is not only instructive, but intensely interesting and thoroughly practical. The book is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. Cloth, \$1.25; paper, \$1. Quilaby's New Hee-Keeping, by L. C. Root.—The author has treated the subject of bee-keeping in a manner that cannot fail to interest all. Its style is plain and forcible, making all its readers sensible that the author is master of the subject.—\$1.50.
Navlee's A H Cof Hee-Ciniture, by A. I. Root.
This embraces "everything pertaining to the care of the honey-bee," and is valuable to beginners and those more advanced. Cloth, \$1.25; paper, \$1.00.
King's Hee-Keepers' Text-Hook, by A. J. Ring.—This edition is revised and brought down to the present time. Cloth, \$1.00; paper, \$5.
Langstroth an the Hive and Honey Bee-This is a standard scientific work. Frice, \$2.06.

Blessed Rees, by John Allen.—A romance of bee-keeping, full of practical information and contagions enthusiasm. Cloth, \$1.00.

bee-keeping, Inil of practical information and contagions enthusiasm. Cloth, \$1.00.

Bee-Culture; or Successful Management of the Aplary, by Thomas G. Newman.—This pamphlet embraces the following subjects: The Location of the Aplary—Honey Plants—Queen Rearing—Feeding—Swarming—Dividing—Transferring-Italianizing—Introducing Queens—Extracting—Quieting and Handling Bees—The Newest Methad of Preparing Honey for Market, etc. It is published in English and German.—Price for either edition, 40 cents, postpaid, or \$3.00 per dozen.

Food Adulteration; What we eat and should not est. This book should be in every family, where it ought to create a sentiment against the adulteration of food products, and demand a law to protect consumers against the many health-destroying adulterations offered as food. 200 pages. Paper, 50c.

The Dzierzon Theory;—presents the Inodemental principles of bee-culture, and furnishes a condensed statement of the facts and arguments by which they are demonstrated. Price, 15 cents.

Honey, as Fact and McLeine, by Thomas G.

Which they are demonstrated. Frice, 15 cents.

Honey, as Food and Medleine, by Thomas G. Newman.—This is a pamphiet of 24 pages, discoursing apon the Ancient History of Bees and Honey, the nature, quality, sources, and preparation of Honey for the Market: Honey as an article of food, giving recipes for making Honey as Medleine, followed by many neefful Recibes. It is the find of for since ers, and should not seekers. It is the find of the market the country of the seekers in the realing a demand for hone published the saist in creating a demand for hone published in English and German. Price for either edition, 6c.; per dozon, 50c.

Wintering Hees.—This pamphlet contains all the Prize Essays on this important subject, that were read before the Centennial Bee-Keepers Association. The Prize—Essi mode—was awarded to Prof. Cook's Essay, which is given in full. Price, 10c.

The Hive I Use—Being a description of the bive

Cook's Essay, which is given in full. Price, 10c.

The Hive I Use - Beinga description of the live nsed by G. M. Doolittle. Price, 5c.

Extracted Honey; Harvesting, Handling and Marketing. A 24-page pamphlet, by Ch. & C. P. Dadant, Hamilton, Ill. This gives in detail the methods and onangement adopted in their aplary. It contains many useful hints.—Price 15c.

Practical Hints to Hee-Keepers, by Chas. F. Mutb: 32 pages 1t gives Mr. Math's views on the management of bees, Price, 10c.

Kendall's Horse Book—No book can be more useful to horse owners. It bas 35 eggravings, illustrating positions of sick hoses, and treats all diseased in a plant and comprehensive manner. It has a large other valuable horse information. Paper, 25c.

Chickee Cholera, by A. J. Hill.—A treatise on its

Chicken Cholern, by A. J. Hill.—A treatise on its cause, symptoms and cure. Price, 25c.

cause, symptoms and oure. Frice, \$5c.

Ropp's Easy Calculator.—These are handy
tables for all kinds of merchandise and interest. It
is really a lightning calculator, nicely bound, with
slate and pocket for papers. In cioth, \$1.00; Morocco, \$1.50. Cheap edition, without slate, 50c.

#### Texas Convention.

The Texas Bee-Keepers' Association The Texas Bee-Keepers' Association convened at the apiary of Judge W. H. Andrews, at McKinney, Collin County, at 9 a. m. The meeting was called to order by the President, Judge Andrews, who introduced Dr. N. P. Allen, President of North American Bee-Keepers' Society, and stated that he would preside over our meeting. A placement side over our meeting. A pleasant shade was sought under the boughs of a large apple tree, which Judge Andrews told us was planted by himself 13 years ago; it was over 12 inches in diameter. We were situated in close in diameter. We were situated in close proximity to the busy bees which seemed to enjoy the balmy breezes as much as their masters, who had assembled in their behalf.

After an expression of general good feeling toward Dr. N. P. Allen for having honored our Society with his presence, the general order of business taken in and called by the Secretary. ommittees were appointed as follows: Committee on resolutions, committee on subjects for discussion, and committee on apiarian supplies: after which Dr. N. P. Allen delivered the following

I am happy to meet so many who are interested in the cultivation of the honey bee—glad to be able to throw in my might to aid you in developing the honey resources of your great State. This is a "land of flowers," and millions of them are wasting their fraglons of them are wasting their fragrant sweets upon the breezes, for the
want of bees to gather it. Millions of
pounds of sweet nectar are going to
waste every year in your State; enough
to supply all the sweets necessary for
the consumption of the people. Pure
honey is the gift of the great Creator.
He makes the forests and fields, the
desert and waste places to bloom in the

He gives us the honey bee, endowed with an instinct for gathering and storing it, in waxen cells, for the use of men.

Man was endowed with reason, intel-

lect, understanding, and was given control over the animal, vegetable and min-

troi over the animar, vegetable and inflereral kingdoms; yea, he was commanded to go forth and "subdue the earth."

The honey bee can be controlled by man in its labors of honey gathering, comb building and brood-rearing, so as to produce large amounts of honey, or to "increase and multiply" to an un-limited extent. Franklin subdued the lightning, and Morse made it subserve the interests of man in transmitting news from place to place with light-ning speed! By the aid of steam, man erses both land and water

Mr. Langstroth invented the movable-frame hive, which gives us entire control of the labors of our bees, so as to make their labors a source of pleasure and profit. But in order to utilize this, we must study its nature and instinct, and become familiar with its habits. and become familiar with its habits. The standard works and text books on bee-keeping, will give us reliable information, and the bee periodicals will keep us posted concerning all the late inventions and discoveries in manipulating and controlling these little busy workers are well as track we have to see acting and controlling these intile busy workers, as well as teach us how to secure and market the honey crops. By availing ourselves of these helps, we can learn in a short time what it took years to learn by observation and experience. We must avail ourselves of the movable frame hive, which gives us entire control of the colony; we should also obtain the best race of bees

we have the black or German bee, the Italian, the Cyprian and the Albinos from which to select, and the Jungles of Asia are being searched by enterprising Americans, with the hope of obtaining at the varieties guarantee. of obtaining other varieties superior to those we now have. Not only should we avail ourselves of the movable frame hive and the best race of bees for gathering large crops of honey, but we should employ the best implements for manipulating our bees. As the agriculturist avails himself of the best machinery for the cultivation and harvest-ing of his crops, so we must avail ourselves of the best implements to enable us to control our bees, and to make them profitable to us; securing our honey in the best shape for market.

The honey extractor enables us to secure large amounts of pure honey, and to return the comb to be filled again and again by the bees.

The bellows-smoker enables us to subdue and control our bees while manipulating them. By the use of 1 and 2 pound sections, we can get our honey stored in convenient and fancy shape for the market.

for the market.

Comb-foundation, made of pure beeswax, is extensively used in aiding rapid comb-building in the brood-nest, and as starters in section boxes.

myriads of flowers, rich with honey; He carpets the broad prairies with flowers, and fills their delicate honey-caps with nectar, suitable for food for the Gods; He gives us the honey bee, endowed with an instinct for gathering and storing it, in waxen cells, for the use of men.

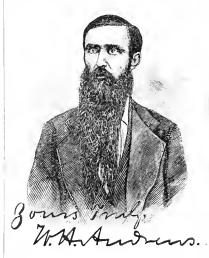

Man was endowed with reason, intel.

Allow me to congratulate you muon.

Allow me to congratulate you upon the progress you are making in the sci-ence of bee-keeping, and in developing the honey resources of this great State. We bid you "God speed," and ask your co-operative in building up the National Association.

Judge W. H. Andrews gave annual address, which was able and full of enthusiasm. He said he knew of no other profession in which the minds of men ran more in the same channel, in which there was more fraternal friendship, or a more earnest desire to dis-seminate knowledge, than among sci-entific bee-keepers. He was glad to meet so many brethren on this occasion, and felt greatly encouraged in the show, and ten greatly encouraged in the success of the organization. It not only showed the desire for the perpetuation of our society, but the untiring zeal which its members possessed.

In 1870, at Sulphur Springs, in Hop-kins Co., the Texas Bee-keepers' Askins Co., the Texas Bee-keepers' Association was organized, and he had the honor of presiding at the organization;

but as bee-keeping was carried on by few persons, and they so widely separa-ted, and the means of public conveyted, and the means of public convey-ance so limited, the Society lasted only a short time. He thought it was kept up two years only; but it was the means, in that short period, of encour-aging the industry to that extent, that flopkins Co, produced more honey than any other County in the State, though only a small portion of the County was adouted to begentive.

only a small portion of the County was adapted to bee-culture.
In July, 1878, the society was re-organized at Greenville, Hunt Co., when he again had the honor of being elected its President. To-day, Collin and Hunt counties produced more honey than any other 2 Counties in the State: and Collin Co. was capable of producing a greater income from its honey resources than from the raising of wheat.

After a general expression of good

FIRST DAY.—AFTERNOON SESSION.

The committee on subjects for dis-The committee on singlets for discussion reported. The first subject was: "What is the best method of preventing excessive increase?"

Judge Andrews was selected to open the discussion. He uses the American circle engine him and an approximation.

side-opening hive, and an empty hive being at hand, he illustrated his method side-opening live, and an empty live being at hand, he illustrated his method of preventing excessive increase by maniputating the hive. He calls the side which opens, the front; the opposite, the back. When a swarm issues, he takes out the three front combs, and reverses the position of the others in the hive, in order to disorganize the brood-nest; at the same time removing all the queen cells, he puts an empty frame next to the back, then a full frame of comb and brood; then another empty frame; then a full frame; then another empty frame; then afull frame; then another empty frame; be then fills up the hive with the remaining full combs after the removal of the first three, which, if full of honey, can be removed to his store-room. Combs containing brood can be used to strengthen nuclei, by placing the empty frames near the back, the will have brood can be used to strengthen nuclei, by placing the empty frames near the back; he will have them filled with good worker comb, and by the time the brood-nest is re-established in the back, all desire to swarm will have passed, and he has a strong colony, ready to commence in the supers.

S. S. Lyday uses the simplicity hive; his method was similar to that just described, except that after removing the queen cells, and re-arranging the brood-chamber, his bees were hived in the upper story, which was placed over the parent colony.

The next subject was, "Which is the most profitable, extracted or comb honey?" The discusion was opened by Mr. M. H. Davis, who said that he by Mr. M. H. Davis, who said that he could produce extracted honey at ½ the cost of comb honey, and that his extracted honey he could sell at 1623 cts. per lb., while his comb honey was worth only from 20 to 25 cts. per lb.

Mr. S. S. Lyday said that it had been his experience, that extracted honey was the most profitable.

M. S. Klum said that in his market,

was the most profitable.

M. S. Klum said that in his market, extracted was the most profitable.

Judge Andrews said that comb honey was most profitable, all things considered. The time employed in extracting, and the expense of putting it up in an attractive shape for the market, were items that should not be overlooked while comb honey in singlelooked, while comb honey in single-comb sections and boxes, was ready for the market as soon as taken from the hive, without any further expense.

"Will it pay to co-operate in pur-chasing supplies?" was discussed, and referred to the committee on resolu-

tions

tions.
"The best marketable shape for honey," Dr. Howard said, that it depended upon the market; but that small packages in an attractive shape found ready sale.
Judge Andrews said that the 1 lb sections and extracted honey in glass jars, pleased the fancy best; that we must have the one honey in an attractive

esting, as well as practical and instructive hints on marketing honey. He recommended small packages for extracted honey, in glass or tin cans, neatly labeled. They must be showy, and as Judge Andrews remarked, we must intickle the fancy. He gave some statictics on sales of extracted honey in 12 lb. tin cans attractively labled, compared with those of the same kind of honey in the same sized cans not labeled, which illustrated the fact that fancy. 2 lb. tin cans attractively labled, compared with those of the same kind of honey in the same sized cans not labeled, which illustrated the fact that fancy labels sold the honey; he was in favor of the 1 b sections for comb honey.

Judge Andrews brought out some extracted honey in a 3 lb. Mason jur, 3 years old, which was only partially candied; it looked neat, and attractive. Adjourned till 9 a. m. to-morrow.

SECOND DAY-MORNING SESSION.

The meeting was called to order by Dr. N. P. Allen, and the committee on resolutions made the following report:

Resolved, That the Texas Bee-Keepers' Association recognize, in the intel-

ligent management of the honey bee, an economical source of wealth to the country, and an easy means of obtain-ing one of the richest luxuries of life, within the reach of almost every fam-

ily. Adopted.

Resolved. That we take steps at once to secure to the members of our Association the benefits of co-operative ef-fort, in securing bee-keepers' supplies, by electing a State agent to make terms with manufacturers and transportation

companies, both as to purchases and freights. Adopted.

Resolved, That we recommend to the bee-keepers of the State to organize local Bee-Keepers' Associations, and to order the apiarian supplies through the agent of the State Association. Adop-

ted.

Resolved, That we recommend to beginners to adopt the simplicity hive.

After some discussion in regard to narrow top-bars and wide top-bars. Judge Andrews said that he did not think that open-top frames possessed any advantage over the closed-top, but from the fact that the simplicity hive was predagated kept in stock by deplers. was made and kept in stock by dealers, and all the fixtures were made to fit that style of hive, he was in favor of the resolution. Adopted. Resolved, That bee-keeping is a more lucrative and less laborious industry

than stock-raising or farming.

After discussion, by several parties whose experience favored the resolution, Judge Andrews was called upon to give his experience. He said, that after estimating his bees at their cash value his experience was represented. after estimating his bees at their cash value, his profits last year were 45 per cent., cost of labor 5 per cent.; while his income on his Jersey cattle was 23 per cent., and the cost of labor 18 to 20 per cent., showing a great balance in favor of his bees, both as to labor and profits. The regulation was abouted. The resolution was adopted.

Resolved, That we tender the thanks of this Association to Messis. Scovell Anderson, of Columbus, Kan., for e exhibition and donation of hives the and fixtures from their factory. Adop-

Resolved, That we tender the thanks of this body to Dr. N. P. Allen, of Smith's Grove, Ky., President of the North American Bee-Keepers' Society, for the interest be has manifested in honoring our Association with his presence, in presiding over our delibera-tions, for his intelligent advice, and for the enthusiasm his words of encourage ment have awakened among us. Adop-

 $\overset{...}{Resolved}$ , That the Texas-Bee-Keepers'Association tender thanks to Judge W. H. Andrews for his pioneer efforts in the bee-keeping enterprise, and for the pains he has taken to exhibit the practical advantages of bee-keeping, and to make this Association a success. Adopted.

solved. That invitation is extended to lady hee-keepers to attend the sessions of this Association and become members of the same. Adopted.
G. M. Cooper, J. P. Nenny, J. R. Wilmeth, Committee.

The Secretary announced that the "doors" of the Association were open for the reception of members; that the requirements for the were to sign the constitution and pay the sum of 25 cents; ladies free. Sev-

SECOND DAY—AFTERNOON SESSION.

The meeting was called to order by

The meeting was cancass. Dr. N. P. Allen.
Mr. F. F. Collins, of Austin, had just arrived, and many were the words of encouragement he spoke. He regretted not being with us sooner, but sickness in his family prevented; however, he was proud to meet with so many becomes it was an indication of suckeepers; it was an indication of success to the Association.

The President amounced that while waiting on the committee on supplies to report, that a few subjects for discussion would be in order.

"Dysentery; its cause and cure," was suggested. Several had never seen

a case of it.

S. S. Lyday asked, what is dysentery

or bee-cholera?

Dr. Howard believed it to be a dis-

ease of the digestive organs, causing restlessness, thin, watery discharges of the feces, to be voided ever and amon in the hive or out of it, as the case might be. There was, doubtless, high febrile excitement which the bee suffernile excitement which the bee suffernile excitements. fered, constantly growing weaker and more sluggish, and, finally, death ensues. It does not affect every colony in the same yard at the same time, nor every member of an infected colony. There is a diversity of opinion as to the cause of the disease. Some say bacteria, some sarvation, some one thing and some say other causes. He was of the opinion that it could be caused at any season of the year, and from what experience he had had, he believed that excessive gorging with honey, and over confinement in a damp, cool atmosphere, such as we have during our long spells of wet weather in the winter and spring, were conducive to the disease. lost several colonies in the last 3 years.

Judge Andrews asked, why did they not all die, all being subject to the same conditions.

Dr. Howard said that extreme heat or extreme cold would excite the bees and they would consume more honey than was necessary for their health in a moderate temperature. Colonies disa moderate temperature. turbed during confinement are more apt to become diseased, if they have plenty of stores accessible. As an even temperature is conducive to the health of bees in confinement, so will extremes be conducive to disease. The cure was simple but not always available—a good cleansing flight, in a warm, dry atmosphere. A clean hive would be advisable, in order to relieve the bees of the task of cleaning out the dead. and removing the unwholesome stench.

M. S. Klum lost a few colonies that were weak, a few years ago, by that dis-

Judge Andrews offered a suggestion to beginners. He would recommend them never to go among the bees without being provided with a good bellows

smoker.
M. H. Davis asked, if a bec-veil or a bee-hat did not have a tendency to make

Some thought that it did. Judge Andrews said that a veil was only necessary when bees were swarming, as then he could not intimidate them with a

Which is preferable, naturalor arti-

regardless of honey, artificial swarming was to be preferred; but if he wished prevent excessive increase and runhoney alone, the manner described by Judge Andrews, yesterday, was preferable. All agreed on these points.

"The chaff hive" was next discussed.
Some one asked: Would it pay in

l'exas ?

Reply: They had not been tried for summer and were considered unneces-

Judge Andrews said that he would remains; those only have living bees not have one in his yard unless he had some one else to work with it. It was obtained to more or less an extent. jectionable, first—because it was expensive; 2d, it was too heavy to handle; sive; 2d, it was too heavy to handle; and 3d, it was wholly unnecessary. He wintered 2 nuclei on one frame of honey each, on the summer stand, without any protection, the past winter.

The committee on apiarian supplies regulate the following report:

made the following report:

We find on exhibition the simplicity bee hive, with and without chaff packing; arrangements with surplus honey; arrangements in the shape of all-in-onepiece simplicity sections; cases and tin separators; simplicity bee-feeder; comb foundation made on a Dunham machine, also one piece of comb drawn out from foundation of the same make, from Scovell & Anderson, Columbus, Kan., all made in good style, which we recommend as first-class goods.
We also find the Quinby smoker, with

cold-blast attachment, and Quinby beeveil, which we recommend as indispensable to bee-keepers, and which on trial

give entire satisfaction.

We also find honey knives, extractors, queen cages, etc., from various parties, which we consider as valuable

ntility to bee-keepers.

We also find Cook's "Manual of the We also find Cook's "Manual of the Apiary," "Quinby's New Bee-keeping," the Weekly Bee Journal, Gleanings in Bee-Calling, Boe-Keepers' Magazine, Bee-Keepers' Instructor, and Kansas Bec-Keeper, all of which are up with the times and ably edited by practical beekannes and any entred by practical beekeepers, and are respectfully recommended to the bee-keeping fraternity.

Respectfully submitted, Wm. R. Graham, M. H. Davis, C. E. Chappell, Committee.

The report was received and the com-

The report was received and the committee discharged.

F. F. Collins introduced the subject

of electing a State agent, through which to purchase apiarian supplies, and a delegate to send to the National Convention, and nominated Dr. Wm. R. Howard, of Kingston, Hunt Co., for State agent, which was carried

State agent, which was carried.

Judge Andrews was nominated for delegate to the National Convention.

F. F. Collins was then elected to repsent the Association at the National Convention, in case, from any cause, Judge Andrews could not go. A vote of thanks was tendered Judge

Andrews and family for their kind hospitality in entertaining members from

The Secretary was instructed to send The Secretary was instructed to send a copy of the proceedings to the AMERICAN BEE JOURNAL for publication, and also respectfully invite other beepapers to copy; also to send a copy to the leading Texas papers, requesting all county and local papers to copy.

The Convention then adjourned to meet in McKinney, Collin Co., on the last Tuesday in April, 1882.

#### Have Our Bees Degenerated?

G. M. DOOLITTLE.

On pages 115 and 147 of the Weekly BEE JOURNAL are articles by E. A. Thomas and S. S. Butler, both saying that all the losses of bees in winter prove that the losers have a weak race in noward said that it depended entirely upon what the bee-keeper wished numbers, regardless of honey artificial accounts. perous condition. Will facts bear these theories out? Let us see. Prior to 1870 there were hundreds of

reflor to 1870 there were influences of colonies of bees within a circuit of 20 miles from me, kept by farmers and others, in box hives, who brimstoned their bees, as S. S. Butler says they did in Eastern Pennsylvania, killing the poorest and keeping the best, scarcely ever losing any, and yet, when the disastrons winters of from 1871 to 1875 came, nearly all were swept away, and to-day, so far as I know, not one colony

That the drones from 1 or 2 apiaries where bees had been divided could have degenerated these bees in so short at time, seems hardly possible. Again, if such were possible, Mr. Betsinger's case does away with that, for up to 1876 he scarcely lost a bee, and he had been dividing and rearing queens for years, and as long as he kept his former shel-tered position, all went well; but when he moved to his present bleak place, his loss exceeded that of any one around him. Well do I remember going there after my loss of 1872-3 and seeing his strong colonies, and then coming home as blue as 1 could well be, to look at my ittle handful of bees in each hive in the latter part of May.

How will Mr. S. S. Butler's degeneration theory account for the great loss of

such men as D. D. Palmer, O. J. Heth-rington, and hosts of others who scarcely ever lost bees before? What is to be said of that 23 colonies which A. P. ever lost bees before? What is to be said of that 23 colonies which A. P. Cowan sold, that all died while his all lived, if degeneration is the cause of

our losses :

I have also had colonies that went down so low that they had only a little brood in one frame, on the first of May, after a winter of heavy loss; but I built them up to good colonies by fall, had them do splendidly the next season, and come through the next winter son, and come through the next winter stronger than any others—when I sustained a loss of  $\frac{1}{2}$ , with the same queen presiding all the time and producing bees that nearly succombed one severe winter, and 2 years later pass through an equally severe winter and come out the best. Not only once has this come under my notice, but several times, flow will Messrs. Butler and Thomas account for this, by their theory?

Mr. Thomas says, after reading the Mr. Thomas says, after reading the reports of those losing  $\frac{1}{2}$  to  $\frac{3}{4}$  of their bees, "When I read such reports I always think that the rest of them might as well be dead, for all the good they as wen be dead, for all the good they will do their owner the coming season."

Mr. Thomas is a little rough to talk so discourageingly to us who are down.

I wish to give a few facts which will

I wish to give a few facts which will encourage those who have lost bees, and which will also show Mr. T. that his thoughts are a little premature.

When the spring of 1875 opened, I found I had but 16 colonies left out of over 100 the fall previous, and from those 46 colonies I sold over 4,800 lbs. of box honey. In the spring of 1877 my loss was quite heavy, amounting to about 13, and that season our average yield per colony was 166 lbs., which was by far the largest yield I ever had. As a rule, we find a good yield of honey followed. a rule, we find a good yield of honey fol-lows a heavy loss of bees.

Mr. Thomas says: "Why is it that some have good success in wintering in some nave good success in wintering in cellar and out, in all ways and all con-ditions, while others lose their bees, no matter how careful they are, or in what manner they winter them? Take the case of Mr. D. D. Palmer, as one of the many which may be cited; was it be-eause his bees were weak and puny that cause his bees were weak and puny that they were all swept away during the past winter, while they have withstood all the cold blasts before? If I am rightly informed, Captain Hethrington rightly informed, Captain Hethrington and Mr. L. C. Root bought bees for several years to replace their bees, (buying them of parties in Vermont, and elsewhere, who wintered successfully) only to lose them the next winter. Will the condemning of all these as weak and puny, solve our wintering troubles? I leave the reader to answer.

Now, while I would gladly point the way out of this darkness of disastrous way out of this darkness of disastrous wintering, and tell you what was the only true cause of our failures. I shall have to confess candidly, that I do not know how to winter bees, and say, as I did in *Glamings*, "I cannot see through it all." All the different theories advanced by the confession of the confession trail. All the different theories advanced only seem to leave us more in the dark. One thing seems to impress itself, more and more, upon the intelligent mind, and that is, that a long cold winter with no chance for the bees to fly from 4 to 6 months, tends toward fly from I disaster, while a warm open winter tends toward success. Also, so far, cel-lar wintering at the North has proven

most successful.

Mr. N. N. Betsinger was here a few

weeks ago and wished me to ask Mr. Heddon, through the BEE JOURNAL, to tell us first what bacteria in the to tell us first what bacteria in the honey is, and how we could ascertain its presence in the honey, so that we could detect it, and not try to winter our bees on honey infected with it. But I see by the Bee Journal for May 4, that he (II.) never saw this supposed bacteria, nor never searched for it.hence knows nothing about it. It is said a knows nothing about it. It is said a drowning man will eatch at a straw, so It is said a we, who have lost bees so heavily, are ready to grasp at anything that has a showing of success, but that showing must be plain enough so that we can at least catch a glimpse of it.

Borodino, N. Y., May 23, 1881.

For the American Bee Journal.

#### "The Straw Hive of the Future."

H. L. CHAPMAN.

Although an amateur in the bee-business, I have long been of the opinion that a straw hive or its equal was the proper hive for bees in winter or mer, in any climate; but do not think I should like the arrangement of plastercoating the inside of the hive, as it is of so cold a nature that it would be liable to condense the moisture in the hive in winter, which I consider very objectionable.

In this vicinity there has been a rather sad experience with bees during he last winter; they were shut up so long (110 days), without a day that they could fly; then 2 days warm enough so that they flew a little; thus 14 days more of confinement before winter broke up. There were 4 parties here having in all 119 strong colonies of bees put up for winter in different kinds of hives, as follows, as nearly as I can recollect: 9 cottage hives, 20 Langstroth, 28 Thorp hive, which is very much like the American in form: 2 in Root's chaff the American in form; 210 1000 s char hive; 30 in box hives, and 30 in the new Haines bive, which is a long hive with 10 frames across it, partition boards and chaff packing in the ends, behind the partitions; the frames are 12x12 inches. The chaff hive which I make inches. The chaff hive which I make and use, I call the Root hive, although it differs in a few points. It has donble walls all around, and a double bot-tom: the space should be filled with chaff, but as I had no chaff I filled one with fine dry pine sawdust, and from the showing last winter, I believe it is a better absorbent of moisture than chaff. The brood chamber is exactly like the Langstroth; the upper story is square inside, and is deep enough to take in the Langstroth frame above the brood chamber; this space I filled with a coffee sack of pine sawdust, which is all the preparation I made for winter, leaving them on the summer stands. others were put up in different v some were put in cellars, some housed, some packed with straw, etc., and left on the summer stands. However, the 2 colonies in the chaff hives were the only ones that lived, the other 117 all having died: the 10 frames of each of those 2 colonies to day are well filled with brood and honey, and are very

strong.
This I take as proof, that to winter bees there must be some arrangement whereby all moisture arising from the bees can be absorbed, not condensed, or carried off by upward ventilation; for in the latter case, the heat from the bees is also carried away. I believe that the brood chamber should also be that the brood chamber should also be protected from the direct rays of sunboth in summer and in winter, as it is a well known fact that if too warm in summer it retards the working of the bees, and in winter the direct sun will be the start to be a summer days. bees, and in winter the direct sun will cause the bees to spread in warm days, and even to fly when the atmosphere is too cold; the effect of the sun is hardly noticeable in the double wall hives, and the bees will not fly until the atmosphere is sufficiently warm to bring them out. For the above reasons I believe that the only practical hive for summer or winter, is one that will protect the brood chamber from the diprotect the brood chamber from the direct rays of the sun, and will also absorb all moisture arising from the bees, he that absorbent chaff, sawdust, straw or any other substance that will do it effectually. I do not think I am prejudice the substance of t

diced in favor of the chaff hive, for I would only be too glad if there could be some other and cheaper hive produced. some other and cheaper five produced, that would be so generally successful in wintering, even though it had none of the other good points. There is no question but that the Langstroth hive is the handiest hive ever invented. any one has been unsuccessful in wintering bees in any hive during the past winter, I should be glad to hear from him in regard to the kind of hives, how put up, etc.

Marcellus, Mich., May 30, 1881.

For the American Bee Journal.

#### Comb Foundation Making.

JAMES HEDDON.

Mr. Editor: I send you some samples which are average pieces, made in full–sheets, on the Vandervoort mill. I have here on trial 2 of these mills, one for thick and one for thin foundation.

I prefer to make the thin on the mill made for the thick, because I can get a base nearly or quite as thin, and a much better line in size and shape, besides the line will be soft and easily worked by the bees, because the cuts are so deep between the dies that the wall in the hive is not hard pressed. Could I have had such comb foundation 12 years ago I might live on the interest of my accumulated wealth to-day, merely from the honey-crops I could have raised with the aid of such an adjunct.

The statement of Prof. Cook, in his "Manual," that "two men could roll 400 lbs. per day" (see page 206), has induced me to write this. My 2 men are and tos. per day (see page 200), has induced me to write this. My 2 men are at work "rolling." and about 100 lbs. of heavy, and 60 to 75 of light, is the extent of 10 hours work for them; this included all the getting-ready and cleaning-up work, besides. I know that we could and did put as high as 40 lbs, per hour (when we were all ready) through the Root mill that we had, but it ran easy and smooth and was the best mill to manipulate I ever worked. The only trouble was in the foundation, a lot of which we are re-rolling, after remelting and re-dipping. It is with foundation, as with other things, the best is reached with the most difficulty.

Mrs. Dunham once made up 83 lbs. of way for me, and the print was excelent (the best Dunham I have ever seen in a lot), but she wrote me that she earned the foundation making it.

When the season is at a close and I have given all these varieties of comb foundation thorough trials, I will report my success with them, giving the rea-

sons as they appear to me, etc.

Dowagiac, Mich., May 28, 1881.

For the American Bee Journal.

#### Covered with Snow, Bacteria, Etc.

J. F. KROPP.

I have 7 colonies left, out of 38 win-I have 7 colonies left, out of 55 wintered on the summer stands. Of these an Italian colony, with a tested queen (the only Italian colony I had) is in good condition; the other 6 are weak. These 7 are the only ones that did not have the dysentery. My bees were too These 7 are the only ones that did not have the dysentery. My bees were too warm during the winter; they were covered by snow from the first week in December until Feb. 10, this being a mild day, I shoveled them out and found the bees very uneasy; 31 of the hives were badly soiled. Feb. 27 I examined them again and found 2 colonies dead and the most of the others were dead and the most of the others were strong in bees; some of them had from 4 to 6 frames of capped brood (7 Gallup frames). I had 20 colonies on loose chip ground, 19 of these were among the first that died, early in March; the ground, is of these were allong the first that died, early in March; the other 18 on solid ground fared better; \(^1\_3\) of them are alive yet; those on the chip ground had the dysentery badly. the hives were damp and the combs moldy, with plenty of sour honey in

Out of 200 colonies in my neighborhood there were, on May 1, 30 alive; 27 of these are in box hives, none less than 11 inches deep; 16 colonies of these belong to one man, which is 's of all he

losing only 12, while others around him lost all? "I gave them 'venl' at the top, in the fall; I did not open themall, then had no 'vent." I bought 7 of these colonies; they are all strong in bees. I found that they did have vent enough -600 cubic inches of empty space in the cap above the bees, with 16 three-quar-ter inch holes in the honey-board; some of the hives had cracks in the covers. How is this for upward ventilation?

These bees must have consumed a rge quantity of "bacteria," having large quantity of "bacteria," having used over 30 lbs of honey per colony. I do not place much faith in Mr. Heddon's theory of vegetable matter or bacteria in the food being the real cause of dysentery. I would ask: why did those to colonies came through without getting the dysentery, while the others in the same yard, and all the others in the neighborhood, except 2 colonies, died of dysentery? If there were only a few bees in a live we might suppose that some colonies might get the honey that was not infected with bacteria. I think that it is unreasonable to suppose that all the bees of some colonies would gather thin honey from trees or nectaries infected, while others would not. even were the source infected that this honey comes from but for a short time; I doubt if all the bees of some colonies would pass it by.

Here is another case: I exchanged ! of the combs of my Italian colony (they had too much honey for winter) for the combs of another colony: this other the dysentery badly; why did not the Italian colony get it, as they used

the same kind of honey?

I hope that we will find out the real ranse, and the prevention in a winter like the past. The Weekly Bee Jour-Nal I highly appreciate.
Varysburg, N. Y., May 18, 1881.

For the American Bee Journal,

#### Too Much Bee-Science.

WM. F. CLARKE.

An intelligent-looking old gentleman called on me the other day, stating that he wanted my advise, as he understood " knew considerable about bees I modestly admitted that I knew a little about them, and he immediately proceeded to set forth his case. He had bought a colony of bees, a year ago, it was the set of the set o in a box hive. They had swarmed, and he had put the swarm in another box hive. During the past winter the young colony had died, but the old one was alive and well. The box they were in was very dilapidated, so much that it would hardly hold together. dilapidated, so much so wanted to get them into a better habitation. How should he do it? If he put a good, new box over the affair, would the bees have the sense to see that it was a more desirable home for them, and remove into it?—I told him they would not.—What then should be I told him them, and remove into it? I told him they would not. What then should he do? The old box would soon tumble to pieces; hence he was in a great di-lemma. I explained to him the pro-cess of transferring. It was all Greek to him. He "never heard of the like before." After much talk and reflec-tion he concluded that there was too much seience about the job "for him to undertake it. I gave him a brief summary of the principles of modern beemary of the principles of modern bee-keeping, showed him a movable frame hive, set forth its many advantages, told him all about extracting, queen-rearing, artificial swarming, etc. He became the picture of despair. There was "too much science" about the thing from beginning to end. I tried to persuade him to get a good manual of bee-keeping, to subscribe for a bee-pe-riodical, and become thoroughly posted in aniculture. But he became despondin apiculture. But he became despondent, thought he would sell his one colony, and have no more to do with such a complicated business. I frankly told him that he had better either master the science of bee-keeping, or give it up, and he left me to consider what he would do. I offered to give any advice and assistance in my power; invited him to call again, and did what I could

They will not take the necessary pains They will not take the necessary pains to learn the principles of apiculture. They expect the bees to manage them-selves. It is no wonder such men fail. But in so doing, they bring up an evil report against bee-keeping, say they have tried it, and found it a humbing. If people were to go into any other business totally ignorant of the way to manage it, who would be surprised at

their failure?

How is it that intelligent persons, who would not expect any other ness to run itself, get into this delusion about bee-keeping? In whatever way this hallucination has come about, there is ample evidence of its existence, and there is little danger that bee-keeping will be overdone, while there are so many under its influence. It will fall more and more into the hands of those It will fall who are ever investigating, always learning, and who deeply feel, that in order to a wise, practical management of their bees, it is impossible for them o have "too much science." Listowell, Ont., May 12, 1881.

For the American Bee Journal.

#### Bees Do Not Injure Grapes.

JOHN W. STURWOLD.

In the latter part of September, 1879, while working among my grapes, consisting of about 200 Concord and Ives seedling vines (it will not be amiss to state here that I have my bees on the north side of the Ives seedling vines which give the best shade I have found), my attention was drawn to a Concord grape that was literally covered with bees, as busy as they could be, extracting the juice from some of the berries in an incredible short time. Having been told the year previous, by my neighbor, that bees destroyed grapes by piercing small holes in them and then sucking them dry. I now had an excellent opportunity to find out whether his statement and charge against the bee was true or not.

On examining I found that on examining From that 4 of the berries on each cluster had a small opening from the size of the point of a pin to that of its head, and these were the ones the bees visited. They would the ones the bees visited. They would also alight on the sound ones, circle around them a few times, searching for an opening, I suppose, but failing to find such, leave for one that was punc-tured. As I could not examine them closely with the naked eye, I cut a few of the ripest clusters I could find, and took them to my room and examined them with my microscope, and separated the good from the punctured, and or my strongest colonies. It took them but a short time to empty the pierced ones, and although the sound ones were on the same board, and literally covered with bees, not one of the grapes was

The next day I repeated the same experiment with 4 colonies, puncturing some of the berries myself, with the same result. Now, what the enemy is that first punctures the grapes, I do not know, but will perhaps find out this season, if my health is spared; but this much I do know, from my own obsernucle I do know, from my own observation and experiments, that bees are innocent of the charge—puncturing grapes, at least in my yards. If I had found them guilty I would not be slow to say so, and dispose of my bees, for I received a larger percentage from my vineyard the last few years than I did from my bees, but I candidly believe the good luck I had with my grapes is

#### THOMAS C. NEWMAN.

EDITOR AND PROPRIETOR,

CHICAGO, D.L., JUNES, ISSL

Mr. J. T. Wilson, of Mortonsville, Ky., sends \$10, and says: " Record me as a life subscriber to the Weekly Bee Journal." That is a substantial cridence of his appreciation. We have pleasure in making the entry accordingly.

We have just learned that Mr. Frank Benton has secured 3 colonies of Apis dorsata, as a result of his researches in the East Indies. He has had a very difficult and dangerous task to perform, and but for his indefatigable conrage and indomitable energy he never could have accomplished it. Bee-keepers throughout the world owe him a debt of gratitude, and will not, only, from my best colony (usually from we hope, be slow to repay it.

The College Report.—The report from the College was not correctly given in the minutes of the Central Michigan Association. We sold down in the fall to 10 colonies; 5 of these were wintered in the cellar, and they are all А. J. Соок. right to-day.

Lansing, Mich., June 3, 1881.

conductor.

\*\* The Groupe Bulletin says that beekeepers will have lots of company in disasters this year, among fruit-growers, cattle-raisers, and farmers whose 1 p.m. Watch carefully their return, wheat winter-killed. What with the and when they are all in, let out your army-worm, chinch bugs, locusts, and virgin queens, giving them a few mincategorithms which are destroying thouscaterpillars, which are destroying thousands of plants every day, there is enough to annoy those in other branches of business, as much as "wintering" and "springing" does annoy and perplex the bee-keeper.

The Indiana State Fair is to be held at Indianapolis, Sept. 26, to Oct. 1. We have received the premium list, and find a premium of \$5 for "comb-honey in 5 lb, boxes." What a sad commentary on the progressive ideas of its " Managers." The Vice President of the National Association should have prevented such an exhibition of ignorance concerning the popular marketable size of honey boxes. Bees are ignored entirely.

Kansas for Bee-Keeping. We are often asked about Kansas as a location for an apiary. Mr. T. J. Berry, Jewell, Kan., writes as follows, on that point:

I have kept bees here in Kansas, dur-I have keep foces neight Kansas, during the past year, and find it a splendid place for them. In Jewell county the bees have all wintered well, so far as I have heard, and they are doing well this winter, so far. I cannot do without the Weckly BEE JOURNAL, and so could not provide a partner year. send my renewal for another year.

#### How to Rear Good Queens.

I keep a few bees for pleasure. have had some now for a years, and always wintered them on their summer I have never yet lost a colony. stands. stands. I have never yet lost a colony. The top bar of my frames are  $11_4$  in.; hottom,  $12_{4}$  in.; sides, 15 in. I cover the inside of the hive well up with woolen cloth. The mercury here was 26- below zero, on several mornings, the winter being very long and cold. Please to give full particulars of the best way to raise first class queens.

I have read in the JOURNAL some particulars how to do it, but have never en a plan so plainly given, so that I It I could try it.— C. II, Howard. felt I could try it.

In order to rear the best queens, we therefore give the plans of several of our most careful breeders. The following is the plan of Capt. W. F. Williams:

In rearing queens, I select a strong, in rearing queens, I select a strong, healthy colony, especially strong in young bees, and remove the queen. The next day, or as soon as the queencells begin to develop, I remove all the combs containing eggs or uncapped lar-I then select comb containing eggs imported stock), and place it in this queenless colony, prepared as above. I queeniess corony, prepared as above. I aim to have my young queens hatch out on the 14th or 15th day. The 10th or 12th day I divide this colony, and prepare as many colonies by dividing strong ones as is necessary for the number of queens wanted. The 13th or 14th day I give to each colony thus we ber of queens wanted. The 13th or 14th day 1 give to each colony, thus prepared, a queen cell. I then keep watch of the cells till the queen comes ont. If well developed, with good wings, I mark the date of hatching; if faulty, I destroy her and give the colony another well or ignit in it with mother week colony. where the betroit Evening News Exemsions from Detroit to the sea; personally conducted by W. H. Brearley, Detroit. Mich. It contains maps, and full instructions, and is a very attractive book. Any one wishing to join in this excursion should communicate with the conductor. cell, or join it with another weak colony. my hives containing selected drones, and those containing virgin queens, to prevent egress of drones or queens. It generally do this about 11 o'clock a. m., or before the drones take their daily flight, which usually occurs about 12 to ing locality, then release your drones: do this daily until all are fertilized. It the weather is favorable, and your bees properly stimulated, you will seldom fail in having your queens fertilized by the 5th day.

Mr. G. M. Doolittle gives his plan, thus:

Our plan of rearing queens is this (and after the results of the past 7 years we have no reason to discard it): In the spring we select the colonies having the spring we select the colonies having the queens giving us the best results the season previous, and as early as possible get them strong in numbers. If we can do this in no other way, we give them broad from other colonies; but by a judicious spreading of the broad the object was represented by a strained without ject can generally be attained without help from other colonies. So we get them to swarm in advance of the rest, thus getting our cells or queens reared just as the bees used to rear them when they first came from the hand of the they first came from the hand of the great Creator, and He pronounced them good. These cells we give to nuclei, which are formed to suit the requirements of the cells, and by the time we wish to use queens in the spring, we have queens that are just as good as those reared by any other method, and, we think, a little better. If we wish a further lot of cells from the same mother, we put the colony containing her in a hive filled with empty combs, and in two or three days, when she gets well to laying, we take away one-half of Shallow frames.

the empty combs, and put in place thereof frames of mostly sealed brood, from other hives, and in about 15 days thereafter we get another swarm with the same queen, and, of course, a fine lot of cells. So we keep on till the swarming season is over. Thus, by a selection of the best queens each year, and rearing them by the best plan, our bees may be improving instead of retrograding.

#### The Results of the Past Winter.

tical Table, showing the different phases of the mortality of bees, during the winter of 1880-81, has brought in should take the advice of those who quite a number of reports, but as it have had the most experience, and the should be as full as possible, we defer best results in rearing queens. We will the general Table for a short time, to admit those that will come to hand dur- ness ing the next week or ten days. Meanwhile we give below the tables furnished by G. L. Tinker, M. D., which we shall also incorporate into the full table when given, but now give it to show the doctor's views, and what he has learned. On account of having obtained a larger comparative number of colonies that were wintered in cellars and bee-houses, than those wintered on the summer stands, he finds do not show such a great difference bethat the mortality has been above 49 the different modes of wintering. Adper cent.

SUMMARY.

The reports compiled are from the Northern States only, and indicate that the lowest rate of mortality has been in well-constructed bee houses, with walls from 15 to 26 inches thick, filled in with sawdust, tan-bark, etc., and built en-tirely above the ground, to avoid damp-

The reports have also shown that bees require more ventilation in winter than is usually given; that the ventila-tion is best given at the top of the hive but may succeed well if given at the bottom; and that much of the loss in protected hives, on the summer stands, was caused by the packing over the frames being too close, or composed of material that would not properly absorb the dampness arising from the bees.

As to the best winter hive, the tables vocates of deep frames, however, may take some consolation.

We would suggest those sending in reports to kindly follow the "form" given by Dr. Tinker, on page 163 of the BEE JOURNAL for May 25, 1881, and to Per ct. | send them as soon as possible.

> Chaff Hives.—Let me assure Mr. O. O, Poppleton (whom I would thank for his friendly criticism) that I did not consider our hives chaff hives. I speak of chaff hives and of packing as separate methods. I judge of chaff hives, not from my own experience, but from that of my neighbors. Most of them have lost heavily in using chaff hives during the past winter. The testimony of Mr. Poppleton is valuable and interesting. Let others give their exper-A. J. Cook. ience.

Lausing, Mich., June 3, 1881.

Any bee-keeper who wishes to recruit up his health, could do it with pleasure and profit by going to the White Sulphur Springs in Virginia. Mr. E. C. Jordan, its owner, is an enthusiastic bee-keeper and a "prince," who makes all his visitors feel happy. We only wish we could spend a month with him; but we must "toil" in the office, and leave the pleasure to some who have the time and means to spare. Send for his illustrated circular, if you want to go to some good place.

A New Business. - Novice remarks: "Our business is principally raising bees by the pound, and now bids fair to be, for years to come." We must confess to be a little perplexed at this assertion. We supposed Novice had a large factory for manufacturing "implements for the apiary," and that such was his principal business-but, of course, we must be mistaken; he certainly knows best what his "business is, principally." But it is "funny," nevertheless.

There is a great demand for bees, since so many were lost during last win- $30_{\odot} ter.$   $\,$  Many will replenish their apiaries.

#### MISCELLANEOUS.

Seasonable Hints.—The Indiana Farmer gives the following seasonable hints:

The bee-keeper's wealth is not estimated by the colonies of which he is possessed, but by their strength, and possessed, but by their strength, and the power and ability with which they are able to gather surplus honey.

Extra frames of comb packed away should be examined often. If they

signs of worms, they must be fu-

migated with sulphur.

Keep the grass and weeds cut away om around the hives. Much time is lost by bees falling in the grass. They may become chilled by the rain or dew in cool weather, or before they regain the hives fall victims to toads or spiders, and young queens returning from their bridal trip are liable to fall in the grass and be lost.

While working with the bees, avoid While working with the bees, avoid all sudden jars, quick, active motions, and never fight them. Careful handling will eure nearly all cross bees, while with careless rough handling, the most quiet will become cross. It is a part of the nature of bees to gorge themselves with honey when alarmed, and when in this condition, they rarely, if ever sting unless pinched. Use the if ever sting, unless pinehed. Use the smoker judiciously, and avoid the disa-

smoker judiciously, and avoid the disagreeableness of stings.

Transferring is best done early in the spring before the colonies become strong, or during fruit bloom, but by careful management, it may be safely less up to the middle of large. A very done up to the middle of June. A very good time to transfer is after a colony has cast a swarm. At this time there are very few bees left in the old hive to be in the way of the operator. The combs being well filled with brood are strong and tough, and less liable to break down. To those of you who still have your bees in box hives, we would say, make or buy a frame hive and transfer your bees immediately. The advantages to be gained will well repay you for your trouble and expense per-taining to the change, and though you have only 1 colony, have it in good shape, and in such condition that you examine it thoroughly, in case all should not be right with them.

Birds, Grapes and Bees.-The New York Tribune gives the following facts concerning the bee and grape controversy. Its correspondent, W, who made the charge that the Italian bees had punctured his grapes, says:

"In fairness to the bees, I wish to say that my charge against the Italians was expressly circumstantial only—the circumstances against them being a mad onset on the grapes of a Concord vine, which was covered with bees and roar-ing with their hum, about September ing with their hum, about September 10, and on which nearly every grape was sucked dry. Such a thing had never been seen before, in more than 30 years' experience with bees and grapes, until now that Italians were established in a large apiary near. Circumstances in favor of the bees are: 1. That some berries escaped, that bunches left accidentally on other vines near were undentally on other vines near were untouched—the whole crop having been gathered rather prematurely in alarm; 2. That there were but few bunches, and those very large, owing to frost having killed the blossoms in May; 3. A heavy continuous rain in the early part of September so urged growth that it is possible that the tender skins of the Concords on this vigorous vine may the Concords on this vigorous vine may have bursted from the gorge. We may find out more hereafter.

Another of its correspondents, Mr. J. H. M., North Evans, N. Y., gives the following criticism on Prof. Cook's article on this subject:

"Prof. A. J. Cook leaves your readers to infer that he now inclines to the opinion that, "from the fact that bees are able to cut away strong paper, and is done.

even factory cloth," it is something analogous to the tearing open of grapes. I am not able to see that it is analo-Paper and cloth are manufacgous. Paper and cloth are manufac-tured from fibrous materials and the bees are able, with their manufibles, to separate the fibres, but not cut them. In my earlier experience with bees, I used strips of cotton cloth and pieces of cotton string to tie the transferred combs into frames, and would remove them in 2 or 3 days, and always found hat the bees had attempted to remove them by tearing the fibres apart, but never saw a string or piece of cloth cut. If bees were able to cut open grape skins, we would all know it; there would not be any doubt about it: the grapes would disappear more rapidly than cherries, before the cherry birds and potato vines—before the Colorado

Mr. D. J. Ellsworth, of Connecticut, gives the following facts:

"The damage done to grapes is getting to be a serious matter. I wonder I have seen so little in print about it, and that we should be kept so long in doubt of who the enemy is. I have a single hive of bees, and we naturally inferred it was their work, but last fall inferred it was their work, but last fall I was informed by a neighbor, that it was all the work of the fire-bird (Baltimore oriole), that he had seen them at work, and I readily gave them credit for it; they are adepts at opening peas. This man has quite a number of bees, but he declares they are innocent. I do not be a live a love and peak they are innocent. not believe bees can break through the skin of the grape, and the work is done with a rush.

The Care of Swarms. - Mrs. L. Harrison, in the  $Prairie\ Farmer,\ {
m says}$ :

As soon as a swarm is fairly clus-red, it should be hived, before the tered, it should be hived, before the scouts return, who have been sent out to find a suitable home. If they have clustered upon a limb of a tree, which the owner is willing to cut off, it is easily done by sawing it off with as little jar as possible, and laying it in front of their future home. A little smoke may be used to drive them in. The hive should be cool and clean, and placed in the shade. A new swarm will placed in the shade. A new swarm will often desert a hive, if left in the sun after hiving. Where the owner has a hive of comb, free from moth worms, it should be given to a new colony, for while they are building one pound of comb, they will store 20 lbs. of honey.

Clipping Queens' Wings.—The Indiana Farmer contains the following:

Although there be some disadvantages in having the wings of the queen clipped, still we believe the advantages are in favor of the clipping, while, as a general rule, the bees do not leave for the woods without first settling, they do sometimes leave without any forewarnsometimes leave without any forewarning. The clipping of the wings does not prevent the bees from swarming, but the queen being unable to accompany them, they will return to the bive pany them, they will return to the five as soon as they have discovered her ab-sence. They may try again next day, if something is not done to prevent. If let go they are likely to try several times, or in waiting until the young queen is hatched will come out with her, when they have east a swarm and gone back to the hive; the combs must be examined, divided, or the cells cut out, the latter of which is a poor preont, the latter of which is a poor preventive, as they will soon build them up again. It is only necessary to clip the tip of one wing. This will prevent her flying, and does not disfigure her. The queen should be handled as little as possible. In clipping, take the queen by the thorax between the left fore-finger and thumb, raise the wing with the point of the scissors and clip, being careful not to injure her. Never take her by the abdomen, as a slight take her by the abdomen, as a slight squeeze is liable to kill her. If you practice natural swarming with the queens' wings clipped, as soon as they commence coming out, keep a look out for the queen, secure her, put her some place out of danger. Remove the old hive, place an empty one on the stand. wait until the bees commence coming back, turn her loose with the bees. They all go in together, and the hiving

The Large Bee of Java. Mrs. Harrison in the Prairie Farmer, gives her views thus:

Much money and time is now being spent by several parties, to introduce the Apis dorsata, whose habitat is Far to introduce ther India and adjacent islands. has never been civilized, but attaches its comb to the limbs of trees, and is said to build its comb 6 feet in length. It is doubtful whether it could be taught to dwell in a hive, or endure the winter's cold. The desirable trait sought in this bee, is the great size. Many of the flowers of the Torrid zone. are of great size, and an all-wise Creator adapted the bee to their wants. The Apis dorsata, if successfully introduced into this country, may be as much too large for our flora as the nahe as tive bee is thought to be too small. A bee that can work upon red clover, has heen much sought for by apiarists, and some now claim to have it, and obtained it by carefully breeding those of the longest tongues. Hardiness is another desirable trait to be sought after by those desiring the best bee.

Uses for Glucose and Grape Sugar. -The Popular Science Monthly contains an article by Professor Wiley on the manufacture of glucose and of grape sugar, the latter being simply an extension of the process for making the former.

This industry sprang up about 12 years ago, and is rapidly extending. Glucose is a sweet syrup made from corn starch, resembling in appearance the molasses of cane sugar, and by reason of its greater cheappess largely affecting the consumption of the cane product. Grape sugar is made to resemble a finely-powdered sugar, and is used extensively to adulterate the sugar of commerce.

(ducose is used chiefly for the manufacture of table syrups, but also in candies, as food for bees, by brewers both in this country and in England, and for making artificial honey, the combs being moulded out of paraffine.

Grape sugar is also applied to some of the same purposes, but principally for the adulteration of other sugars.

The cheapness with which glucose syrup and grape sugar can be produced has led to its extensive use. The most lourishing manufactories are at the West, where corn was bought last year at a little over 30 cts. per bushel. As from 26 to 32 lbs. of glucose syrup or of grape sugar are made from a bushel of corn, the average cost of either to the manufacturer is about 1 ct. per lb. As he sells either article at 3 to 4 cts. per lb., the business is a yery lucrative one, and is rapidly extending.

On the 1st of August, there were 10 factories in operation in the United States, consuming daily about 20,000 bushels of corn. There were also in process of construction 9 other factorles, with a total daily capacity of 22,000 bushels of corn. Prof. Wiley estimates that not less than 11,000,000 bushels of corn will be converted into glucose and grape sngar during the present year, and says that "every indication leads to the belief that the amount will be doubled in 1882.

In the above extract Prof. Wiley is forced to admit that glucose has no legitimate useful purpose to which it is put, or for which its manufacturers  $dar\epsilon$ to advertise it! In the third paragraph he admits that its use is "principally for "adulteration," and the only excuse for making it, is the fact that it can be manufactured at a cost of one cent per pound, and can be sold for 3 or 4 cents—thus making it a lucrative business. It seems to us that any respectable journal should "blush to murmer," or even to breathe, an excuse for making the villianous trash, whose only excuse for existence is fraud and swindling, cheating and imposition, deception and adulteration!

GLEANINGS.

Glucose for Feeding Bees. Mr. Root cautions all against feeding grape sugar for winter stores, and says: "The first experiment Lever made with it, for wintering, caused the death of two colonics." He then adds:

The case Mr. Langstroth mentions in the Bee Journal of May II, seems to show very conclusively that grape sugar should not be used for winter stores, and I cannot see why our friend McCord should have done so foolish a thing as to have given the greater part of the stores of 3s colonies a feed mostly grape sugar. Although I have never known a good article to produce dysentery, I should have certainly suphosed it would have hardened in the cells so as to Although I have never known starve them.

The Best Bees for Wintering .- Mr. II. B. Harrington remarks:

The Cyprians wintered the best of any bees I had. The Holy-Lands did not winter quite as well, but were not in as good condition in the fall. They m as good condition in the fail. They will get up earlier in the morning, fly faster and further than any other bees 1 ever saw. The queens are very prolific, and they build up strong, very quickly in the spring.

New Way of Putting Wires into Foundation.-Mr. A. I. Root gives the following plan:

I picked up an ordinary button-ook, such as ladies use for buttoning their shoes, and after filing a lit-tle groove in the back of the hook, so it would not slip off the wire. I found it was even better than the wire, friend Bliss sent. You want your frame all wired as usual, and your sheets of foundation cut so as to just fill—the frames. Have a hoard also, cut so as to just slip inside the frame.—Lay the wired frame Inside the frame. Lay the wired frame over the board, and put the sheet of foundation between the diagonal and upright wires. Now run your buttonnorm wires. Now rin your button-hook along on each wire, with force to imbed the wire slightly. Turn the frame over, and do the same with the diagonal wires, and it is ready to hang in the hives.

Stingless Bees.—In reply to several important questions, Mr. H. Burmeister, of Buenos Aires, South America,

Stingless honey bees are without exception welipowes.
They live in hot and woody countries,

and are not found near Buenos Aires. Near Mendoza I found a plentiful kind of Melipows anthidiaides; another smaller and more unknown kind I caught near Tucuman. Both of these kinds produce no honey. The honey of the insects of this hot climate is prothe insects of this hot climate is produced by a kind of wasp, such as Lechiguana or Polybia seculdaries and Canutati, known as Necturinia lechiguana;

guana or Polybia scalellaries and Canu-ati, known as Necturinia lechiquona; both of these kinds are plentiful, but not as far south as Buenos Aires. The honey-gathering melipones live in large companies, as do our honey bees; but it is not yet known whether they send out swarms, or how they multiply. In Brazil it is the custom to take a few egg-containing combs (of several kinds) gg-containing combs (of several kinds) and put them in boxes near by, to in-duce them to be domesticated, and sometimes with success; but not al-ways, and their new home must always be near their old one in the forest.

The honey of these *unlipones* is more owing than the honey of our house flowing than the honey of our house bees. If it can be crystallized, it is not

The webs are unright, and the cells horizontal like those of our bees, but are generally much smaller; the wax is dark—almost black. I got some in Tucuman to look at.

It is impossible to cross them with our honey bees, as both live in great hostility to each other.

The inclipance have the power, like

The melipones have the power, like ants, to eject a biting fluid, which produces a birning sensation; there are about 40 different kinds known; they attack persons in the face who disturb their home, and are very troublesome.

# SELECTIONS FROM

Bees are Booming. -The ground is covered with white clover. We had honey dew this morning. The bees "sung" gloriously, as soon as it was light. Sumac, which exists here in 2 varieties, is coming on finely, and af-fords the most of the surplus hency in this section; it is rich and secretes heautiful and delicious honey. I can only repeat what hundreds have said about the Weekly BEE JOURNAL. "I like it." MARTIN LEIDY. Carthage, Mo., May 27, 1881.

Cannot wait for Monthlies.—When my term is out for the Weekly BEE Jour-NAL, send it right along. I cannot do without it. It is the paper for the apiawithout it. It is the paper for the aparist. Once a month is too long to wait, in these fast times, and," don't you forget it."

W. S. BUCHANAN.

Hartford, Ind., May 27, 1881.

Pleased with the Cyprians.—My Cyprian queen wintered well, and I ampleased with her bees, so far, although I do not find them so easy to handle as the Italians: they shake from the combs as reaady as the blacks. Out of 134 colonies I have but 30 left. Most beetween in this locality, have lost from keepers in this locality have lost from 5-6 to all their bees. J. E. Moore. Byron, N. Y., May 28, 1881.

Determined to Achieve Victory.—My strong colonies of hybrid bees were wintered on the summer stands, with-out protection, and 1 have 5 strong colonies lett; the balance have gone to "de oder side ob Jordan," I used the following hives: 2 American, 4 farmer's friend, 6 Langstroth, and 9 Armstrong's Centennial. I now have 4 strong colo-nies in Armstrong's Centennial, and 1 mes in Armstrong's Centennal, and I in Langstroth hives. I regard the former the "boss" in every particular, and I shall use no other, hereafter. I expect to Italianize most of my bees this summer. I have purchased 3 tested Italian queens from 3 of your distinguished advertisers, and expect to receive them in a few days. I am not yet discouraged but an going into the batdiscouraged, but am going into the batdiscouraged, but am going into the battle, this time determined to achieve victory. The prospect for honey here this season, is rather good. The way I like the Weekly BEE JOURNAL is "too numerous to mention." Long may it live. THOMAS J. WARD, J. P. St. Mary's, Ind., May 26, 1881.

My First Winter.—I put 5 colonies into winter quarters, all in good condition, in double-walled, sawdust hives, on summer stands, protected on the inside with cushions, etc., on the outside side with custions, etc., on the outside with leaves, banked on 3 sides, and boards on the fourth, so arranged as to keep the wind from blowing and the sun from shining into the entrance, and on movement and the characteristic of the figure them a flight in the middle of February and they came through beautifully. I noticed the first pollen April 2; during this mouth 1 fed di-Intel maple syrup, out-of-doors, spar-ingly, and they built ap surprisingly. On May 1, I transferred I of them to on May 1, transferred to them to moteh cornered Langstroth frames. On May 5, I had my first swarm (a very large one). The queen's wing being clipped, they went back, and 2 days afterwards, came outagaos, m., the contrary not with standing. So, ve the contrary not with standing. I wanted terwards, came out again, my efforts to unwillingly, I divided; I wanted to drive them into boxes, but I was a little drive them into boxes, but I was a little late, or rather they were very early, as at that time the leaves on the trees, were only in bud; honey, however, was very plenty, as I had extracted from 3 colonies to give the queen room, and I colony was at that date. May 8, building comb in side boxes. Our fruit bloom has been largely spoiled by a long, cold storm, so we shall have a set back, I summose. It may be worth mentioning suppose. It may be worth mentioning hat the colony which was building in side boxes was wintered in a glass ob-servation hive on Langstroth frames, with division boards on each side, and think the Langstroth hive very poor for entire glass back. The only difficulty wintering in cold weather. In March, I have to encounter is that my business when the weather was cold, I opened which turn up about 3 feet, to exclude and place of future meetings.—ED.

The Relative Merits.—Will some prominent breeder (Mr. Alley, for instance) give in the BEE JOURNAL his views concerning the relative merits of the 4 varieties he is breeding? We, who have only one kind, do not care to introduce into our apiaries bees that we know nothing about; while if we knew a little more about them, we might get them immediately. H. L. G.

Loss 2 out of 40 Colonies.—My bees are doing splendidly now, I have already had 6 swarms. I lost 2 out of 40 colonies, wintered on the summer stands, in the Mitchell hive. I would as soon see a swarm fly to the woods as to miss one copy of the Weekly BEE JOURNAL. H. WHITE. Woodbury, Ky., May 28, 1881.

Are Bees a Nuisance?—Will every bee-keeper who can afford to donate the time and a postal card, please send me a postal card stating in brief what he may know in regard to bees being a nnisance; where and under what conditions they are allowed to be kept, and ditions they are allowed to be kept, and if there has been any actions on the part of corporations or individuals to move them, and the success of the same. I hope to receive a personal reply soon, through the mail, and to be able to reciprocate the favor.

James Heddon.

Dowagiac, Mich., May 30, 1881.

Losses of Bees in Minnesota.—As many are in favor of a general report to be published in the JOURNAL I will give mine, with others in this vicinity, as far as 1 am posted: I had 147 colonies, in good condition, with plenty of nice sealed honey last fall, packed them with chaff 5 inches all around on the outside, with entrance contracted, no cushions on side or top, nor contraction cusions on side or top, nor contraction of frames, but left them as they were through the summer, 9 and 10 frames, 18 inches long by 11 deep, Langstroth hive on summer stand. I have now 55 hive on summer stand. I have now 55 colonies alive, about a dozen are rather weak, the rest are doing well; my whole bees have wintered well until about the 15th of Feb., when they commenced getting the dysentery, which by further confinement kept on until the 24th of March, on which day they had their first general cleansing flight and 95 were alive then; quite a number of them were weak and dwindled account. were alive then; quite a number of them were weak and dwindled away, and some swarmed out which had nice and clean, combs, plenty of honey, and quite a lot of brood and eggs, till they were reduced to 55 colonies; long con-finement with too much pollen in their hives, I believe, was the cause of the dysentery. The following is the loss of others, unprotected: A. 25 colonies, tree and box hives, lost 21; B. 6 colonies, Langstroth hives, lost 6; C. 6 colonies, Langstroth hives, lost 6; D. 6 colonies, box hives, lost 6; E. 11 colonies, lost 6; E. 11 colonies, lost 6; E. 11 colonies, lost 6; E. 12 colonies, lost 6; E. 11 colonies, colonies, box fives, lost 6; E. II colonies, Langstroth hives packed on 3 sides, lost 1; F. 15, Langstroth hives in cellar, lost 1; F. 40, Langstroth hives, partly packed late, lost 39. They were all on the summer stands except the 15 mentioned in cellar. Others of whom I don't know particulars have lost nearly all.

C. Theilmann. Theilmanton, Minn., May 31, 1881.

The Best Hive for Winter,—In the fall of 1880 I had 75 colonies of bees. About the middle of November 1 put a cellar and left 35 out-of-doors.

takes me into the city every day, from 8, a. m. till 5, p. m., so that I labor at a disadvantage. On May 22, I had 2 swarms: I shall have my first box honey inside of a week.

FRED C. BOWDITCH.
Brookline, Mass., May 20, 1881.

some Langstroth hives and found bees m one end of the hive and the honey in the other, and the bees dead and dying. By a temperature of 20 above zero the bees did not move towards the honey, but stayed where they were till the honey was all gone, and then died. I sayed nearly in this condition by mutting by a temperature of 20° above zero the bees did not move towards the honey, but stayed where they were till the honey was all gone, and then died. I sayed many in this condition by putting a frame with honey over the top. All in my 10x12 hives wintered and bred up better and to-day are far ahead of those in the Langstroth hives; I think that hive calculated for business, without reference to the nature of bees. ever found a beetree 17 inches in diameter? Let a certain number of people on a cold day stand in a cluster and they will feel warm; stretch them in long lines and notice the difference have some hives made with frames 9 inches wide and 12 inches up and down Such will not let them starve with plenty of honey in the hive, will resist the cold better, and assist breeding. They have 12 frames and are 2-story. They have 12 frames and are 2-story. I think broomcorn would make a good hive, <sup>3</sup>4 of an inch thick, put in a wooden frame. Plaster put on straw destroys the good non-conducting quality of straw. The second story could be make of wood. I think bees died from cold and long confinement, not from Mr. Heddon's bacterias. I think the Weekly is a credit to its editor and a sample of his enterprise. I never expense a sample of his enterprise. I never expected it would succeed half as well.

T. HULMAN, SR.
Terre Haute, Ind., May 29, 1881.

My Visit to Texas.—The Texas beekepers' held their State Convention under an apple tree planted by Judge W. Il. Andrews. The weather was delightful, and the bees were swarming as well as the bee-men; 9 swarms issued on the first day of our meeting, and 5 on the second day. A more pleasant and enthusiastic convention I never attended; the members seemed to be very anxious to promote the science of beekeeping. Texas is a splendid country for bees. They winter well, without the least protection. I have visited several apiaries, and find that many bees are kept in Texas. Mr. Collins, who has traveled extensively over the State, says that bees do well all over it, and that the restlements. says that bees do well all over it, and that they gather large crops of honey. I have visited a number of bee-keep-I have visited a number of bee-keepers' in different Counties—but all in Northern Texas. I find bees in good condition. Natural swarming is the order here; they complain of too much swarming here. Black bees in box hives can be bought from \$2 to \$3 per colony, and in movable frame hives from \$2.50 to \$5. I visited one bee-keeper who has 90 colonies in American and simplicity hives for sale. He keeper who has 90 colonies in American and simplicity hives for sale. He says he sold 2,000 lbs. of box honey last year at 15 cts. per lb. His bees are mostly hybrids; he has them in nice condition. Bees do well here on the water courses. The soil is very rich and productive; weeds grow to perfective, twee or other honey from the and productive; weeks grow to perfection; bees gather honey from the ratan, a climbing vine which is common here in the timber. Of the honey producing plants that grow spontaneproducing plants that grow spontane-onsly on the prairies and water courses, the mints of which there are several varieties, (called here horse mints), stand at the head of the list. They are not like the horse mints of the Middle and Northern States. The clovers do not grow here. I saw melilot clover at Judge Andrews' in Collin Co.; it is being tested, and should it do well, will be extensively cultivated. N. P. Allen.

Wintering Bees in a Wet Cave .- I made a cave by digging 4 feet, as deep as I could drain (our country being flat) as I cond than (one country being nar) and built the rest on the top of the ground, which was about 2 or 2½ feet, and walled with lumber. I put heavy timber across the top with a solid brace 40 in a cellar and left 35 out-of-doors. The latter 1 put in 4 rows, moved the hives close together, packed straw all around, leaned an 18-inch board on the back side, and darkened the fly-hole with a small board. Feb. 22, the first warm day, I moved all from the cellar; all were alive but 2. Since then I have all were alive but 2. Since then I have each end, and from the outer end of now. I use the Langstroth hive, and one 10x12. All in the former were poor in bees, compared with the latter. I think the Langstroth hive very poor for it was 3 or 4 feet thick. It has 2 venti-

mice (one with wire on the end froze over for me), these were 4x6 inside, made of fencing lumber; one of these was over the ditch, and had an escape pipe with an elbow to exclude light in the top, which was 2x4 inside. I put in 65 colonies, and 2 nuclei (and 4 for my neighbor), being weak ones, and, on April 13, took out 59, nearly all in fine condition. I have since united down to 53, which are now all ready for clover, but about 8 are rapidly coming up. I call a clover swarm, one from ½ to 4-5 full of brood, having 12 brood-frames of about 96 square inches. Those of my neighbor's came out all right. I would like to call attention to this fact, that this cellar had water in it all the winter. In November, and a part of December, I carried in water, and then we had a rainy spell that nearly thawed the ground; this soaked through the top, which was nothing but fresh dirt, and dropped through all over the hives, standing in great drops on them for about 6 weeks. Water about an inch deep stood on the bottom, and from the time the rain came mice (one with wire on the end froze ter about an inch deep stood on the bottom, and from the time the rain came, in February, the water was soaking in and running through; several times surface water ran in at the ventilators, besides the dropping and soaking in at the sides. I was alarmed at times to see the condition of things, but the bees seemed to be all right. I thought the see the condition of things, but the bees seemed to be all right. I thought the combs would mold, more especially those that were on the bottom, as the water often touched the hives from the bottom; but there were not a dozen moldy combs in all. I observed closely, and the mercury was never below 38°, nor higher than 45°, during the whole time standing at 40°, when the water was pouring through, and the bees were so quief that you could not hear a stir was pointing through, and the bees were so quiet that you could not hear a stir among them. That encouraged me, as I thought they were all right when they were so quiet. They also wintered on were so quiet. They also wintered on fall honey, mostly smart-weed, and con-sumed very little. My bees are Ital-ians. Bartlett Z. Smith. Tuscola, Ill., May 29, 1881.

An Early Swarm.—I had a very large An Early Swarm.—I had a very large swarm to-day; I do not think it can be beaten north of the 40th parallel. The losses in bees have been very heavy in this county, and those left are weak. All are black bees but mine. My bees are very strong, and some are working in the boxes. They were wintered on the summer stands.

L. A. Lowmaster. Belle Vernon, O., May 29, 1881.

The next meeting of the Cortland Union Bee-Keepers' Association, will be held at Cortland, N. Y., Tueswill be hem as your day, August 8, 1881. C. M. Bean, Sec.

#### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

CHICAGO.

HONEY-The market is plentifully supplied with honey, and sales are slow at weak, easy prices. Quo-table at 15m lec, for strictly whose white comb in 1 and 2 lb.boxes; at 10m 12c, for common dark-colored and broken lots. Extracted, 72m 15m 15m, 15m 17m, 1

NEW YORK.

HONEY.—Best white comb honey, small nent packages, 14a/IC; dark Ho/12; large boxes 2c, less.— White extracted, 9a/Hc; dark, 7coke, BEESWAX.—Prime quality, 20a/25c.

CINCINNATI.

HONEY.—The market for extracted clover honey spood, at 80 10c. Comb honey is of slow sule at 16c. of the best.

BEESWAX—186 22c. C. F. MUTH.

SAN FRANCISCO.

SAN FIRANCISCO.

HONEY-Most of the honey now in market, both in first and second hands, has been either withdrawn or placed at a limit above corrent rates. The action is confirmatory of the unfavorable prospective force referred to. We quote white could 12664c; dark to go d. 96-11c. Extracted, choice to extra white, 55mc3c; c. dark and canded, 4665c.

BEESWAY-216623c, as to color.

#### SPECIAL NOTICES.

Single copies of the Journal are sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

 $\mathbb{SF}$  When changing a postoffice address, mention the  $\mathit{old}$  address as well as the new one.

The Volume of the BEE Jour-NAL for 1880, bound in stiff paper covers, will be sent by mail, for \$1.50.

We have prepared Ribbon Badges for bee-keepers, on which are printed a large bee in gold. Price 10 cents each, or \$8,00 per hundred.

Notices and advertisements intended for the Weekly BEE JOURNAL must reach this office by Friday of the week previous.

Many Lose Their Beanty from the hair falling or fading. Parker's Hair Balsam supplies necessary nourishment, prevents falling and grayness and is an elegant dressing. ....

Constitutions and By-Laws for local Associations \$2 per 100. The name of the Association printed in the blanks for 50 cents extra.

We can supply but a few more of the back numbers to new subscribers. If any want them, they must be sent for

Instead of sending silver money in letters, procure 1, 2 or 3 cent stamps. We can use them, and it is safer to send such than silver.

Sample copies of the Weekly BEE JOURNAL will be sent free to any names that may be sent in. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the persons they desire to interview, by sending the names to this office.

The date following the name on the wrapper label of this paper indicates the time to which you have paid. In making remittances, always send by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, and local checks, are not taken but the banks in this city occur. taken by the banks in this city except at a discount of 25c., to pay expense of collecting them.

PREMIUMS.—For a club of 2, weekly we will give a copy of "Bee-Culture;" for a club of 5, weekly, we will give a copy of "Cook's Manual," bound in cloth; for a club of 6, we give a copy of the Journal for a year free. Do not forget that it will pay to devote a few hours to the BEE JOURNAL.

At the Chicago meeting of the National Society we were requested to get photographs of the leading apiarists, to photographs of the leading apiarists, to sell to those who wanted them. We can now supply the following at 25 cents each: Dzierzon, the Baron of Berlepsch, and Langstroth. The likeness of Mr.Langstroth we have copied, is one furnished by his daughter, who says, "it is the only one ever taken when he was in good health and spirits." We was all to be able to see group one of such are glad to be able to secure one of such a satisfactory nature.

It would save us much trouble, if all would save us much trouble, if all would be particular to give their P.O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name. Many others having no Postoffice, County or State. Also, if you live near one postoffice and get your main at another, be sure to give the address we have on our list. dress we have on our list.

An Old Lady writes us: "I am 65 An Old Lady writes us: "I am 65 years old and was feeble and nervous all the time, when I bought a bottle of Parker's Ginger Tonic. I have used a little more than one bottle and feel as at 30, and am sure that hundreds need just such medicine." See advertisement

LIFE and ADVENTURES of ROBINSON CRUSOE.

This well-known book may be ranked as the most popular standard jnvende book ever printed. Our obtion is complete, and contains the wonderful adventures of a cast-away upon a desert island. Complete in one vol. Fully illustrated.

THE PILGRIMS PROGRESS

From this world to that which is forcome. This remarkable book, as every one knows, was written under the similitude of a dream, by John Manusch of Schrift in the Manusch of Bresche Cook BOOK.

island. Complete in one vol. Fully illustrated.

THE PILGRIMS PROGRESS
From this world to that which is to come. This remarkable hook, as every one knows, was written under the similitude of a dream, by John Bunyan, the most popular religious writer in the English language; and perhaps more comes have heen sold than any other book except the Bible. Our edition is complete and unabridged, with appropriate illustrations.

propriate illustrations, GULLIVER 5 TRAVELS. This book tells of the supposed travels and surpris-ing adventures of Lenniel Gulliver into several remote regions of the world, where he net with a remote regions of the word, where he net with a race of people no larger than your hand. Also his wenderful exploits among giants. Complete in one volume. Finely illustrated.

his wenderful exploits among grants. Complete in one volume. Finely illustrated.

THE ARABIAN NIGHTS' ENTERTAINMENTS. Illustrated with numerous wood engravings, descriptive of those many strange and singular stories which the legend says the Sultaness of Persia related to the Sultan hight after might, in order to prolong her life, and thus finally won his affections and delivered the many virgins, who but for her would have been sacrificed to his project resentment.

SAVED AT LAST FROM AMONG THE MORMONS. Every man and woman in the land shound read this story which is founded upon facts, and gives an insight into the low estate of woman under

the Moimon rule.

RREAD AND CHEESE AND KISSES.

By B. L. Farjeon. A very popular Christmas story after the style of Dickens; abounds in excellent and novel features; is chiefly remarkable for its admirable picture of country life, giving the history of a very happy and contented young couple who thought no lot in life too lowly for the pure enjoyment of Bread and Cheese and Kisses. Complete in one volume, with illustrations.

NOBLE DEEDS OF MEN AND WOMEN.
A history and description of noble deeds, presenting correct and beautiful models of noble life to awaken the impulse to imitate what we admire. By the recorded actions of the great and good we regulate our own course, and steer, star-guided, over life's trackless ocean. Complete in one volume, with Hinstrations.

1 over life's trackless ocean.

The usual price of these books bound in cloth is \$1.00 to \$3.00 each. We propose to bind them in heavy paper or thin card board, and send them by mail and prepay the postage, for 25 cents each. They comprise a wide range and striking diversity of the most brilliant and pleasing productions of the most noted and popular authors, and include books of travels, adventures, fiction and humor, so that all the tes will be suited. We propose to call if the FARM AND FIRESIDE LIBRARY, and any one obtaining these ten books will possess a library of ten of the most popular books ever published. We have not food to give a full description of each book, but all will be delighted who obtain these noted books at so low a price.

THE HADDES will be the latest and most considered with contain reconstitutions and will contain reconstitutions.

THE ROOKS will be the latest and most complete editions, and will contain many illustrations, alone requiring thirty-nine pactures to complete it.

THE PAGES are about 5½ by 8 in hes—the most convenient size for reading and preservation.

THE TYPE is Minion, casy on the eyes. THE PAPER is heavy and of a brantiful white color.
THE FIRST BOOK, Robinson Crusoe, was ready about April 1st. One of the others will follow ry two weeks and be mailed to subscribers as soon as published.

every two weeks and be mance to scoos tribets as soon as published.

HELLABLE.—Messrs. Rowell & Co., publishers of the American Newspaper Directory, writing of the publishers of Farm and Firestore, say, "they are necrodified by the Mercantile Agencies with a capital of a Milhon dollars, and are too well known and too much respected to make it worth while to make any statements which are not true." Therefore all are sure to get the above books if careful to direct letters correctly.

MONEY SHOULD BESENT by Post Office Money Order or Registered Letter, addressed to Publishers of FARM AND FIRESIDE, Springfield, Ohio.

## Florida Land--640 Acres.

CHEAP FOR CASH.

DESCRIPTION,—Sec. 4, township 7, south range 7 west, Franklin county, Florida, situated about 50 miles south of the Georgia line, 25 miles west of the city of Tallahasse, the capital of the State, and about 25 miles northeast of the city of Apalachicola, a seaport on the Gulf of Mexico, and within 2 sections (5 and 6) of the Apalachicola river; the soil is a rich, sandy loan, covered with tumber.

It was conveyed on Dec. 31st, 1875, by Col. Alexander McDonald, who owned 5 sections, inclinding the above, to J. M. Murphy, for \$3,200, and on Sept. 5th. 1877, by him conveyed to the undersigned for \$5,000. The title is perfect, and it is unmountered, as shown by an abstract from the Records of the county, duly affected beceipt are in my possession.

I will sell the above at a bargain for cash, or trade for a small farm, or other desirable property. An offer for it is respectfully solicited. Address,

containing a great number of pictures.

NEW FARM AND FIRESIDE COOK BOOK.

JESTCOOK BOOK EVELTPIBLISHED. Contains about 1,000 Recipes. It is just the book that every wide and housekeeper needs. It tells how to cook all kinds of bread, cakes and meals; it tells how to make all kinds of song; it gives recipes for cooking fish, oysters, poultry and game; it tells how to select the best poultry, ish, meats, etc.; it gives the best methods of preparing sauces and salada and all kinds of vegetables for the table; and tells the housekeeper all she needs to know about bread, bisconts, roils, puddings, mes, custards, creams, cookies, tea, coffee, choredate, home-made candies, antidote for pod-on, cooking for the sick, and many other useful things.

#SOP'S FABLES.

other useful things.

#SOP'S FABLES.
The Fables of Esopus, an apt representative of the great social and intellectual movement of the age which he adoned. Born a slave, he forced his way by his mother-wit into the courts of princes. He knew that to be tolerated in courts he must speak to please, and he gave besons both to prince and people by rectals of fables, which were very popular in Athens during the most brilliant period of its literary history; and he who had not Æsop's Fables at his finger's ends was looked upon as an illiterate dunce by Athenian genthemen. In one vol. Very profusely illustrated.

have concluded to carry a stock of them, and can fill orders for any quantity promptly. For nating Sections, Cases, Frames, Racks, Crates, &c., they have become quite popular.

The entire length of the null being the same thickness, they never loosen as ordinary iron muls will, and are not as hable to bend or break.

From the assortment of lengths given in the table below, any kind of nailing may be done with these nails, even to making large boxes.

### Books for Bee-Keepers.

Sent by mail, postpaid, on recelpt of price, by THOMAS C. NEWMAN. 1971 West Madison Street, CHICAGO, H.L.

'nok's Manual of the Aplacy. Entirely re-lition, greatly enlarged and elegantly illustrated 

Novice's A BCof Rec-Unitarie, by A 1 Roof. This embraces "everything pertaining to the care of the boney-bee," and is valuable to beginners and those more advanced. Cloth, 81, 25; paper, 81, 00.

King's Bee-Keepers' Text-Book, by A. J. King. This edition is revised and brought down to the present time. Cloth, \$1.00; paper, 75c.

Langstroth on the Hive and Honey Ree This is a standard scientific work—Price, \$2.00.

This is a standard scientific work. Price, \$2.00.

Blessed Bees, by John Allen, A romance of her-keeping, full of practical internation and contaglous enthusiasm. Cloth, \$1.00.

Bees-fullarie; or Successful Management of the Apiary, by Thomas G. Newman, This pamphlet enthurces the following subjects: The Location of the Apiary. Honey Phants. Queen Rearing—Feeding. Swarming Inveloid Transferring-Indianizing Introducing Queens. Extracting. Quienting and Handling Bees. The Newest Method of Preparing Honey for Market, etc.. It is published in Engilsh and German. Price for either edition, 40 cents, postpad, or \$5.00 per dozen.

Food Adulteration; What we cat and should not eat. This book should be in every family, where it ought to create a sentiment against the adulteration of food products, and demands law to protect consumers against the many health-destroying adulterations offered as food. 200 pages. Paper, 50c.

tion of frood products, and demand a law to protect consumers against the many health-destroying adulterations offered as food. 200 pages. Paper, 50c.

The Dzierzon Theory; presents the fundamental principles of bose-ciliure, and furnishes a condensed statement of the facts and arguments by which they are demonstrated. Price, 15 cents.

Honey, as Food and Medicine, by Thomas B. Newman.—This is a painthlet of 24 pages, discoursing upon the Ancient History of Rees and Honey (the nature, quality, sources, and preparation of Honey for the Market; Hothey as an article of tool, gying recipies for making Honey takes, the ottool, gying recipies for making Honey takes, and article of tool, gying recipies for making Honey takes, and after of tool, gring recipies for making Honey takes, and after of the price of the country, and thus assist in creating a demand for honey. Published in English and German. Price for either edition, 6c.; per dozen, 50c.

Wintering Rees.—This jamphlet contains all he Prize Essays on this important subject, that were read before the Centennial Ree-Keepers Association. The Prize Sin gold was awarded to Prof. Cook's Essay, which is given in full. Price, 6c.

The Hive I Use. Being a description of the hive used by G. M. Doolstile. Price, 5c.

Extracted Honey; Harvessing, Handling and Marketing.—A 21-page pumpilet, by Ch. & C. P. Dadant, Handling, III. This gives in detail the methods and management adopted in their apary. It contains many useful hints. Price 15c.

Practical Hints to Ree-Reepers, by Chas, F. Mith Ser James.

methods and management adopted in their apary. It contains many useful hints. Frice 15c.

Practical Hints to Bec-Recpers, by Chas. F. Muth; 32 pages—It gives Mr. Muth's wiews on the management of bees, Price, 1Oc.

Kendall's Horse Book No book can be more useful to horse owners. It has 35 engravings, illustrating positions of sick hoses, and treats all diseases in a plain and comprehensive manner. It has a large number of good recipes, a table of doses, and much other valuable horse information. Paper, 25c.

Chicken Cholera, by A.J. 101. A treatise on its cause, symptoms and cure. Price, 25c.

Ropp's Easy Calculator.—These are hand tables for all kinds of merchandrs and interest. It is really a hightning calculator, incely bound, with state and pocket for papers—In elicit, 84, 60; Morocco, \$1,50. Cheap edition, without slate, 50c.

MOORE'S UNIVERSAL ASSISTANT,

Ind Complete Mechanic Enlarged Edition, contains ov 1,000,000 Industrial Facts, Calcul water—a Car Load, Stowage in Sh Water, Wind, Shrinkage of Custin for Housekeepers, Earmiers, Garde Bee-keepers, Limbermen, etc. Fe Jurial Economy, Food Values, Cinc Jor do, to increase Crojs, Pest For-Steam Power on Farins. Light's Cubic Me, sures, Ready Reckours, I

"Fourse couplete treatises on the different sulperts." Set, 4m. The work contains 1,000 pages, is a vertualle Treasury of Useful Knowledge, and worth its weight in good to any Mechanic, Business Man, or Farmer. Free by mail, but fine cloth, for \$2.50; in leather, for \$3.50.

Translated for the American Bee Journal.

#### Bees Feed each other in Winter.

DR. DZIERZON.

Messrs. Greiner Bros. have favored us with a translation of the following article from the *Bienen-Zeitung*:

Some time ago the question was asked: How do bees provide themselves in winter with food; do they individually take the honey out of the cells, or any take the honey out of the cells, or do they transmit the same from one to another? In the fall, when there are yet numerous uncapped cells of honey within or near the cluster, they probably feed in the way first mentioned; that this cannot be the case in winter, whereall the uncapped honey in the winter. when all the uncapped honey in the win-ter quarter is exhausted and when only the top, or may-be one side of the cluster is anywhere near the stores, cannot ter is anywhere near the stores, commoleave any doubt. If the honey in nearly all the spaces which the bees occupy is consumed, and only one side of the cluster has access to the stores, the cluster has access to the stores, the colony suffers no inconvenience on account of hunger, as long as there is perfect communication throughout the cluster. The bee passes every drop of food she can spare to her hungry sister, which meets her with outstretched tongue to receive the charitable gift of her fellow-insect; when the supplies fail and starvation takes place, the colony dies together in a body.

The question might arise here. How is

Bee's Tongue, and Connecting Glands.

The question might arise here, How is it possible that bees in a compact cluster, as they are in midwinter, can succeed in transmitting food from one to another throughout the entire cluster? Well, according to my observation, it takes place in the following way: The bees take, after certain periods through which they are in a semi-torpid state, a certain amount of food; they effect, when preparing for these meals, an excitement—the temperature rises, the certain amount of succeeding the properties of the certain amount of food; they effect, when preparing for these meals, an excitement—the temperature rises, the certain amount of food; they effect, when preparing for these meals and enables the bees to

communicate among themselves; the communicate among themselves; the capped cells are then opened, or if such are not yet within reach, empty combs are gnawed, and even holes cut through them to open passages to the necessary provisions. If it is, therefore, noticed in the winter that a hive has an uncompany captility of these very active under mon quantity of these wax chips under the frames or near the entrance, it is a sure indication that starvation is at the

That bees in their winter quarters change their position whenever they are compelled by hunger, I had occasion to observe in a housed colony last winter. The building was, in regard to change of temperature and light, completely of temperature and light, completely protected, so that my bees were kept perfectly quiet. When I opened the straw-door of the hive carefully, the bees did not make the least noise or get in any way excited. There was no chance for these bees to get around by outside means, and still I found weekly (the usual interval of my examinations) on the outside comb next to the door, small clusters or scattered bees which were sometimes only chilled, and by warming them were brought back to life again, and sometimes were gone bewarming them were brought back to life again, and sometimes were gone be-yond human aid. This can only be ex-plained by supposing that the bees, although not disturbed by any outward cause, excited themselves and spread the cluster for the purpose of taking food, after which they gradually con-tracted again, and left these few to per-ish on the outside by becoming detached is non the outside by becoming detached from the cluster and chilled. In this way, perhaps, most of the bees that die in winter are lost. This can be prevented, to some extent, by cutting passages through the combs within the cluster, and a still better plan is to lay a comb of honey on the frames in such a way as to allow the bees a free passage from one space into the other.

a way as to allow the bees a free passage from one space into the other.

To the question, After how long an interval do bees repeat this feeding process? a positive answer cannot be given any more than we could fix the exact amount of honey it requires to winter a colony. This is governed by temperature and season generally. When extremely cold, we conclude from the humming noise we hear that bees are in this excited state almost continually. this excited state almost continually, and it is, perhaps, not over-rated to say that they eat more on one such day than they would otherwise in a whole week.

they would otherwise in a whole week.
It is certain that bees, if they are not compelled to create an unusual amount of heat, can still live after every drop of honey in the hive is consumed; but how long they will survive under different circumstances and still be capable of perpetuation, is a matter for further investigation.

From the American Naturalist.

#### Bee's Tongue, and Connecting Glands.

open only at the top. For the benefit of those who may still doubt as to this structure, I have drawn, under the camera, a very fine cross section of the ligula, kindly loaned me for the purpose by my friend, Mr. David Folsom. He has succeeded in cutting it from a specimen with the rod thrown out of the sheath (see Fig. 5).

In going over the work of Mr. Hyatt, while examining a mounted specimen

while examining a mounted specimen of mouth parts, my friend, Mr. F. B. Doten, pointed out, in the mentum, a Doten, pointed out, in the mentum, a small spiral tube that gave me a clue, which followed up, has resulted, as I believe, in a slight addition to our knowledge of the parts. I am unable to find any mention of the glandular structure, a description of which follows. The drawing, No. 1, showing the head, is somewhat diagramatic, structures that might confuse being

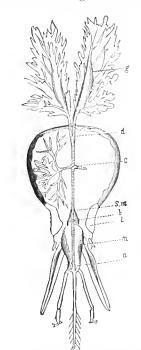

Fig. 1.—Diagramatic. a, point where spiral tube enlarges; m, mentum; sm, sub-mentum; t, mandibles; b, opening into month; t, entrance of ducts from head; d, junction of ducts from thorax; g, glands in thorax.

neglected. The specimen here represented was taken while fresh, pressed flat, dried under pressure, bleached in turpentine and mounted in damar.

It shows the structure as represented, from the tip of the ligula to the opening in the mouth at b. Beyond that I had to resort to dissection, not extremely to resort to dissection, not extremely difficult with a sharp scalpel, a steady hand and patience. It is best performed on alcoholic specimens, and the magnified drawing, under camera, of the gland from the thorax (see Fig. 3), it will be understood is somewhat shrunken on that account.

Running the scalpel from the base of one mandible back across close to the neck and forward to the other mandible, turn forward and pin, remove the

thorax the spiral ducts of two glands, which will be found, on following back, which will be found, on following back, lying one on each side of the esophagus, in the space between the muscles of the wings. I have given one of these, Fig. 3, magnified 35 diameters, as drawn under the camera. It could be but little more than outlined, as it was a dense mean of called and twisted.

was a dense mass of coiled and twisted glands, the true structure of which is shown (Fig. 4) still more magnified.

At the base, the duct enlarges, as is seen, into quite a reservoir. The ducts unite within the neck, or just as they are the base and fellowing the decrease. enter the head, and following the floor

Fig. 2.—Fragment of glands of head magnified

of the latter, are joined by a pair coming in right and left (Fig. 1, c). Following up one of these side glands, we find it dividing into 3 main branches, ultimately terminating in glands, the structure of which is shown in Fig. 1, much enlarged. It will be seen that the glands from the thorax bear a strikthe glands from the thorax bear a striking resemblance to the Malpighian tubules of insects, while those from the head are larger, different in shape, and composed of much smaller cells. Keeping to the floor of the head, the main duct passes on to the sub-mentum. Here on joining the spiral tube coming from the ligula, it passes by an opening common to both into the mouth at b, Fig. 1. Below the opening the spiral tube dips into the mentum, and is imbedded in its muscles.

At a (Fig. 1) it seems to terminate, judging from a side view, but a series of cross sections shows it to gradually

 $\mathbf{F}_{\mathbf{IG}}, 3.\mathbf{-One}$  of the glands of the thorax, magnified thirty diameters.

Meeting this tube from the lugula, and discharging its contents through the same opening into the mouth, is the spiral duct from the glands of the head

The questions are at carce thrust upon us, whence comes this structure? and of what use is it to the bee? If I was wise the article would end here, but our inclination to explain everything by resorting to speculation, is always strong in the absence of facts to curb it. It seems but natural from the size, position and outlet of the glands, connected as they are with an inlet for the nectar of flowers, to conclude that they are or-

Fig. 4.-Fragment of glands of thorax magnified.

gans that furnish the animal secretion gans that turnish the animal secretion that changes nectar into honey, and I would venture the suggestion that they may be the spinning glands of the larva modified. If this is true, I should expect to find them either in an active aborted condition in nearly all Hymen-

Another question raised, is, in what Another question raised, is, in what way is nectar carried from the flower to the mouth? This must be, from the nature of the case, largely a matter of speculation. Prof. Cook, in his article, says: "The tongue is also retracted and extended rythmically while the bee is sipping." May not this motion be due to a superior action of the growed. due to a pumping action of the grooved rod of the ligula, that enlarges and di-minishes the size of the sack lying be-hind it? It would seem that the bee has perfect control of this rod, that it is remarkably clastic, and capable of much extension—and—contraction.—The—rod extension and contraction. The rod and sack thus acting as a suction and force pump, as will be easily understood by one familiar with the parts.

Of course I cannot say that the bee makes this use of it, but I do say it should, and if it does not, it is pure stu-

pidity on its part. And if some one demonstrates that I am all wrong now. evolution, at no distant day, will set me evolution, at no discant day, whi see he right, for there will be born a bee, less conservative, that will dare defy old usages, and take a new departure; that bee, trust me, will make use of this eumingly-devised apparatus, and produce honey cheaper than any competitor eventing the glucose man, and I tor, excepting the glucose man, and I hope and trust may worry even him.

For the American Bee Journal.

#### The Coming Bee, or Apis Americana.

J. F. LLORY.

As the "coming bee" seems to be the As the "coming bee" seems to be the great absorbing question of the day, I will give my opinion as to "how to catch him," after an experience of over 25 years of bee-keeping in Virginia, Iowa, and California.

In July, 4861, while in Iowa, I obtained my first Italian among from Merican and the second seems of the second seem

near here, May 2, and on the 8th 1 took a lot of foul broody bees on shares. This a lot of foul broody bees on shares. This was the first foul brood 1 ever saw or handled, and 1 do not want to handle any more, although 1 do not dread it like I used to, since I have learned how to handle it. Then on the 15th of November following I bought 45 colonies, intending to make bee-keeping my business while I remained here. And now, in as few words as possible, I will tell you how I have managed them ever since, and let you be the indge as to since, and let you be the judge as to whether I acted wisely, and if I am not

whether I acted wisely, and if I am not on the track of the "coming bee."

I tacked a label on each hive, and made a note, not of their stripes (some had 1, others 2 and 3, and some had none), but of the amount of honey taken from each one, also of their other bad and good qualities; then, when the season closed, I made a note of each colony, in my memorandum book, selecting my "breeders," and condemning those with undesirable qualities, while all was yet fresh in my memory.

I then bred my queens and drones from my best colonies, destroying my poorer queens, and this I have kept up ever since. I also obtained bees from different places, far and near, to im-

different places, far and near, to improve my stock and to prevent in-andin breeding, and as a further improve-ment of my stock, I sent an order for 12 Italian queens to Illinois. When, on the 9th of August, 1879, 11 arrived safe and sound—one having died on the way, my neighbors took 3, and 1 kept 8; but lost one in introducing. I only reared some s or 10 queens that fall, as I do

some 8 or 10 queens that fall, as I do not like to rear many queens from a colony until I have first tested it.

This brings us to the season of Isso, and this will bring out the special points I wish to notice in this article.

The season was cold and windy, and have deep retained by The season was cord and windy, and bees done nothing but swarm until after July 20.—I reared about 60 queens in the spring, about half of which were Italians.—I aimed to have half of my in the spring, about half of which were Italians. I aimed to have half of my drones Italians, but do not think I got half of them Italians—when I say Italians, I mean the Illinois stock. I call my stock the American bee—yes, 'full-blooded American' stock. But out of all my young Italian queens, I do not believe I have one that mated with an Italian drone; whether any of the American queens mated with any of the Italians I do not know, as they do not breed up to a fixed type of rings, horns, etc. All the queens I got from Illinois I pronounced pure.

On the 20th of July I commenced

On the 20th of July I commenced hauling my bees to the river (I was hauning my bees to the river (I was then living about 3 miles on the plains); I hauled 62 on the Stanislaus, and lett them in charge of a neighbor bee-keeper. They had little honey there; keeper. They had little honey there; and 24 I hauled on Great San Joaquin, where I had charge of them myself; 12 were full-blooded Americans, 9 were young queens, the 3 others were 1 or 2 years old. My 3 Illinois queens (the other 4 having died, and another died this winter) and 8 daughters of the Il-linois queens, and one I think was a grand-daughter, from an 1879 queen that I think was superseded last spring.

The following is the result of the year's operations of 24 colonies, as I copy from my memorandum book; No. 68, American queen, 450 lbs.; 69, Italian, none; 70, Illinois queen, 68 lbs.; 71, American, 106 lbs; 72. American, 141 lbs.; 73, grand-danghter of Italian queen lbing heavy \$150 lbs.; 74, 14 lbs.; 60 lbs.; 60 lbs. lbs.; 73, grand-daughter of Italian queen (nice honey) 225 lbs.; 74, Italian, 90 lbs.; 75, Italian, 118 lbs.; 76, Illinois queen (dead now), 87 lbs.; 77, American (condemned), 56 lbs.; 78, Italian of 1870 (but little gum), 160 lbs.; 79, American (very gummy), 168 lbs.; 80, American, 106 lbs.; 81, Italian queen of 1879, 106 lbs.; 82, Italian (no gum), 90 lbs.; 83, American (condemned), 33 lbs.; 84, American 81 lbs.; 85, American onten will give my opinion as to "how to catch him," after an experience of cover 25 years of bee-keeping in Virginia, Iowa, and California.

In July, 4861, while m Iowa, 1 obstained my first Italian queen from Mr. Langstroth, which, I think, were the first Italians west of the Mississippi River. For some 6 or 8 years I "bred for stripes," as that seemed to "he all limits and losing their queens, 22 lbs.; 88, Illinois queen, 22 lbs.; 89, American, queen for 1879, Italian queen of 1879 (no gmm), 120 lbs. Now, from the foregoing, you will see that 2 gathered no honey, being the go"then; but I finally came to the conclusion that honey paid better than stripes, and so changed my tactics and

average of 112 lbs. per colony; the 3 with Illinois Italian queens gave 177, an average of 59; while their 7 daughters and grand-daughter gave 1,092, an average of 136; but a glance at the figures show that the grand-daughter has beat them all, she giving 25 lbs. of honey. She is also credited with getting the nicest honey.

A lot of bees 1 obtained on the Mer-

A lot of bees 1 obtained on the Merced River, 5 years ago, were good honey gatherers, but desperate swarmers, which to me is a serious objection to any stock. Another, and the last lot, 1 got way up on the Sacramento, in 1877, had some good qualities, but not equal to mine. I never, before last fall, figured up so close the honey from each strain of bees, and I must confess the figures astonished me. figures astonished me.
I never found fault wilh the Italian

queens and bees from Illinois, and have no doubt that they are a good strain of ho doubt that they are a good strain of bees. My neighbor that got 2 of those queens, claims that they are the best stock of bees he ever owned, and that about the only honey he obtained last

about the only honey he obtained last fall was from his full-blood, and from the few queens he reared from them.

But what puzzles me is this: While the full-blood figured so low in honey, why did their daughters, mating with my improved drones, figure so high? The average of 59 lbs. for the full-bloods, against 112 for the Americans, shows the superiority of my strain. But why did none of the young Italian greens mate with the Italian drones? queens mate with the Italian drones? Were the American drones so much hardier, tougher, more active, and longer winged, so that the Italians could not keep up in the chase after the queen? or, what was the cause? Can your numerous readers solve the question?

Now you have my idea as to how to "catch the coming bee." A few of our leading bee-men (and they are by far too few), claim that the drone is "a mighty factor in the improvement of the honey hee," but I claim that he is "the mighty factor." I have long since been satisfied that the drone does more to determine the character of the progeny than the queen, and have acted accordingly, and have had no reason to regret my labors in that direction.

Ripon, Cal., March 2, 1881.

#### Bee Notes from Mississippi.

OSCAR F. BLEDSOE.

It seems to me, as a looker on, that the results of last winter's cold should the results of last winter's cold should make "an end of controversy" as to the method of wintering bees in the North, and that good cellars should always command the preference, as the safest and most economical plan. It has been demonstrated that the only cardiing precessing to safe wintering as to condition necessary to safe wintering out-of-doors in this locality is an ample quantity of stores, yet, even here, I am convinced that it would pay to put small colonies and muclei, that could be easily moved in and out, in a cellar during the severest weather. Suppose, for instance, during the flow of honey from the hitter weed in August, I should make a large number of nuclei, in order to raise pure tested queens for ship-ment early the next season, it would certainly pay me to put the nuclei in a cellar during the coldest spells, and I

shall try the plan.

The thought has occurred to me that it might be profitable for Northern beent might be promisine for Northern beckeepers, who are favorably situated, to ship bees South on the approach of cold weather, to be returned North the next season, say about May 1. The certainty of safely wintering and the superior condition of the bees when returned would be superior to the superior condition of the bees when returned would be superior to the su superior condition of the bees when returned, would more than counterbalance the expense incurred. Bees frequently commence to gather pollen here in January, and swarm from the last few days in March through April, so that bees shipped here trom the North in October would safely winter beyond a peradventure, and could be returned full of brood, and perhaps in double or triple numbers. The addi-

dibles. This opening is transverse, and seems to have lips, and from its appearance we should expect it to close like a valve, if suction was applied below.

Soon had the satisfaction of knowing you see, I did not have my best colonies in this lot. The result summed up, makes over 2,500 lbs.; all comb honey.

The 11 Americans gave 1,241 lbs., an The express companies, in order to estimate the control of their uncases. tablish such a business, could afford to carry and re-carry on moderate terms. Such inter-communication between the Such inter-communication between the North and South would thus not only be of pecuniary advantage, but would be pleasant socially, and tend to strengthen the National tie.

I noticed, during the last winter, that there is great advantage in wintering in a tall hive—cold affected my colonies in single-stored hives much more sensibly than in the double-story ones. snip than in the double-story ones. As 1 use a shortened Langstroth frame,  $115_8 x 91_8$  inches, when 1 put one story on another my hive is the equivalent of a box hive with frames. Towards the close of winter I found my colonies in 2-story hives even comparatively stronger than those gentined to a single story er than those confined to a single story. ar than those commed to a single story. The bees would retreat upward as far as possible from the entrance, and, as spring approached, commenced to rear brood in the upper story, extending the brood-nest downward as the warmth of the weather inversed. the weather increased.

brood-nest downward as the warmth of the weather increased.

I put a frame with cloth tacked on the bottom, and tilled with cotton seed, on the top of each hive. This covering and distance from the entrance causes the top part of the hive to be the warmest part of it, and hence is preferred by the bees. Just here I will remark that in my judgment the full length Langstroth frame, while it is of the proper depth, is too long to combine the most advantages for apiaries, either Northor South. I may be radical in this opinion but I believe that Doolittle is right in regard to the principles that should guide us in the selection of a frame, as he is on many other subjects connected with the apiary.

If the National Society should ever give its sanction to a standard frame, it would. I hope, not be the Langstroth.

in the Automa Sacrety should ever give its sanction to a standard frame, it would, I hope, not be the Langstroth. A small frame is preferable in these respects: I. For 2-story hives—hence especially for warm countries like the South—and if 2-story hives are best for winter, then for the North also; 2. For obtaining straight combs; 3. in the use of comb foundation, sagging and breaking down not being so probable; 4. In making nuclei, raising queens and shipping; 5. In artificial swarming, taking frames of hatching brood from strong colonies to give to weaker ones, so much not being taken at once, etc.; 6. In handling the frames, extracting, etc., the weight not being so great. I make these remarks, notwithstanding the practice and authority the other way, as a candid doubter, for considering the great variety of frames used, and the solver, wealting the principant to the great. great variety of frames used, and the injury resulting therefrom, to the gen-eral interests of bee-culture, it becomes us all to express our opinions in order to a "survival of the fittest."

#### Bee-Keeping in Ireland.

WM. CARR.

You will see by the British Bee Journal, we did a great work for Irish bee-

nal, we did a great work for Irish bee-keeping last autumn.

The Baroness Burdett Coutts, Presi-dent of the British Bee-Keepers' Asso-ciation, and whose name here is a household word for everything that is good, the Duchess of Marlborough, Canon Bagot and others that take an interest in Ireland, persuaded the Coun-cil of the British Bee-Keepers' Associ-ation to send their bee-fent on a tour ation to send their bee-tent on a tour all through Ireland, to instruct the peo-ple in the improved way of bee-keep-ing. So the Council persuaded me to ing. So the Council persuaded me to go and lecture to the people, whilst Mr. Abbott, the editor of the British Bee Journal, was manipulating the bees in the tent. We commenced at the Royal the tent. We commenced at the hoyar Irish Agricultural Show, at Clonmel, in the south of Ireland, on August 11, 12, and 13th. We showed and explained to the people how to do every operation with bees

round the queen like a natural swarm; we then placed the cap on our head, and walked all over the show-ground and walked all over the show-ground amongst thousands of people with about 20,000 bees on our head and face, and nobody received a sting. This was Wildman's feat, 108 years before (see page 12 of my pamphlet, a copy of which I sent for your acceptance, on December 21, 1880, and hope you re-ceived it series, and that you were ceived it safely, and that you were pleased with it, I had only a few printed for my friends).

Newton Heath, England.

[We noticed and returned thanks for Mr. Carr's interesting pamphlet, in the BEE JOURNAL of January 19, on page 20. -Ep.1

For the American Bee Journal,

#### Burying Bees in Clamps.

C. J. ROBINSON.

Ever since 1860 I have wintered my small colonies under ground, in clamps so-called. This sort of winter reposiso-caned. This sort of white reposi-tory was first devised by a scientific bee-keeper, in Germany, and promul-gated in this country by the lamented Samuel Wagner.

Samuel Wagner.
The clamp mode is set forth in "Langstroth's Hive and Honey Bee." I do not follow, strictly, all the details of the plan as specified in said book. I select a dry, mellow spot of earth, dig a trench somewhat wider than a hive will cover, and some 18 inches deep. Fill the trench about full of dry straw, laid in loosely; put scantling or sticks across, over the pit, and place the hives thereon in a row. Arrange the interior of each hive so as to give ventilation, as may be hive so as to give ventuation, as may be required, taking caution against intrusion by mice. Spread dry straw along on each side of the row of hives, completely covering them, and the earth that forms the bottom of the pit. Now place boards, so as to form a box over the row, but in such a manner as to form a chamber, or air space, of 8 or 10 inches all around the top and both sides, with transle all of which is 5-12 cm. with trench: all of which is fully filled with the straw, not packed. Then put another coat of straw over the boards, and over that a coat of earth—like potatoes are buried in a pit.

The points in the case are: the straw absorbs the moisture of the earth and keeps the hives dry; the vacant space all around the hives allows dry air to circulate all through the cave and hives; this is one of the essential conditions; a freezing atmosphere is excluded, and is another condition in any plan of bee salvation. None of the creeds of packing above ground are rational, and the end thereof is sure destruction, unless the bees are equal to saving themselves,

On Nov. 141 put 4 colonies in a clamp one of which was a small after-swarm that my neighbor had in a box hive only about half filled with comb. He said that it could not be wintered, and gave me that, and another not much stronger. to prove to him the benefits of a clamp repository. On the 15th of March I took the 4 colonies out of the clamp. On opening the smallest I found the litthe colony as lively as when first put in and now they are doing finely. All of the 4 were in the best condition, and

the 4 were in the best condition, and have remained thus.

I have put my small colonies in clamps each year, except 1879, when I kept none. I do not remember of losing a colony in a clamp. In my first attempts I kept ventilation in view—I feared to shut off a free circulation of air, and I placed a tube (gun barrel) in the lower end of the pit, and a chimney in the top. end of the pit, and a chimney in the top. The free admission of atmospheric air defeats all of the advantages to be gained by burying. Indeed, it is the long terms of cold air that does the harm under all conditions, rousing the bees to activity in a sea of oxygen. All should know that the honey bees may. under certain conditions, remain semi-

time, only one revived, and she only laid drone eggs thereafter.

and drone eggs thereafter.
In a well constructed clamp, with the
atmosphere entirely excluded during
severe cold, the bees remain quite torpid, and very quiet, in a low, even temperature, needing scarcely any vital
oxygen, and consuming but little honey; hence there is no occasion for a flight for evacuation. Large clusters of bees do not afford the best conditions under special protection, for too much heat is special protection, for too much heat is generated in the center, and a supply of oxygen must be present, defeating quietude. A 2-pound colony is more manageable and can be wintered more safely than one larger. Large colonies, while being wintered above ground (I abhor chaff packing) require ample abhor chaff packing) require ample supplies of atmospheric air, with a plensupplies of atmospheric air, with a pre-titude of honey for combustion, wear-ing out the bees, and "packing" their alimentary canal until it gives way. The Author of Nature, who gave to bees the laws of instinct and their pro-

pensities, has given a lesson for man to study, and when he has learned their true history, he has learned all that can

be known on the subject. Richford, N. Y.

For the American Bee Journal.

#### The Cause of Dysentery.

J. O. SHEARMAN.

I notice the difference of opinion among experienced apiarists on the cause of bee-dysentery, and wonder why we cannot come nearer to an agree-

One fact is noticeable, that the disease is more general in a long and severe winter; and this should be the ba-

Bees have been known to come out bright and healthy after a steady con-finement of 4 months. Benry Bird's bees, 2 years ago, were put in a dry, cool and quiet cellar, in November, and were taken out the following April, without loss, and all were healthy and strong, and the honey in good condition.

tion.

As to "bacteria," why does not some scientific "bee-ist" give us the proof, if "that is what's the matter?" Assertions do not satisfy. The proof of the pudding is in chewing the string, Bingham says—but Mr. Heddon has given us that string to chew for 2 years, but only that string to chew for 2 years, but only the end of it that didn't touch the pud-ding or bag. Did not "bacteria" flour-ish as well last year as this? If not, why not? I do not wish to attack any one's pet theory, but Mr. II. says, "let us reason together." Yes; let us chew the whole string howing to use the order us reason together." A es; let us chew the whole string, hoping to use the pud-ding. I agree with him that the chief cause of bee-dysentery is the condition of the honey, and I will add, at the time of hum gotton. of being eaten. This may seem super-fluous; but I have experimented with honey for 2 years, off and on, and proved to my satisfaction that honey changes in its character in different In a continued cold and damp seasons. season, it turns thin; my theory is that bees can use thin honey if they fly frequently. They can endure long con-finement if the honey is thick and in good condition. I believe this is generally admitted.

The long cold weather thins the honey; the breath of the long-confined noney; the breath of the long-commen bees, also belps this on, and when warm weather begins (i, e, a thaw), it sours the thin honey, and then comes the worst form of dysentery. The second confinement (after a warm spell), is more disastrons than the first.

more disastrons than the first.

Now for the whole string, which I hope Mr. II. will be the first to experiment upon with his accustomed ability.

Two years ago, I put a box of sealed honey in a cupboard, in a room with no lire, but adjoining a room having a stove, in which was a fire in the daytime, but none during the night; the temperature of the room chanced twice temperature of the room changed twice in 24 hours. The box of honey was of the button-willow, and oozed through the caps a little in the fall; in the spring, it oozed enough to fill the box and run over, with a frothy appearance. the button-willow, and cozed through does this year, and the prospects for the the caps a little in the fall; in the spring, it cozed enough to fill the box an ice house during 36 hours. He and run over, with a frothy appearance, said they were thoroughly chilled—stiff with the cold, and white with frost. The box of noney was or none wa

this spring.
Again: all my bees wintered well, and were bright and healthy, except 2, in 1879 80. Those two were very strong hybrid colonies, which gave a late swarm; the broad chamber of the able addow was full of broad at the late swarm; the brood chamber of the old colony was full of brood at the time, and the swarm filled its own hive (after I gave it combs), so that both had hives filled with late honey. I packed them on summer stands, the same as the rest. The old colony had the dysentery badly early in February, and when a thaw came in the middle of February so many had died inside that The swarm had the dysentery when the that the balance were not worth saving. The swarm had the dysentery when the the thaw came (in Feb., 1880), so I cleaned them out and found nearly half dead. It reserved the combs beginn cleaned them out and tound nearly nan-dead. I reserved the combs having sealed honey, and hung them up by a stove pipe, till they had done sweating (3 or 4 days); when the weather came, for a half hour or so, I cleaned the eased colony again, and exchanged combs, giving them the solid warm honey, and contracted the brood chamber to 4 combs. When the next thaw came they appeared clean, had begun breeding, and did well with some help in spring.

Last spring (1881), I had plenty dysentery to experiment with, but the weather was not fit to open a hive till the spring opened, and then I exchanged some combs in weak and sickly

colonies, with beneficial effect.

Do not these instances give a key to Do not these instances give a key to the cause, and justify further experi-ments in the same direction? I ask the co-operation of the fraternity in this line, and an impartial judgment, hoping that the question of wintering bees will be solved thereby.

New Richmond, Mich.

For the American Bee Journal.

#### Bees and Honey in Florida.

W. S. HART.

Seated on a broad veranda, with the cool and balmy breezes from the piney woods and the broad river fanning your brow, the long lines of towering orange trees, in their pride of gold, green and white, shading the nicely painted, busy homes of the apiarist's pets, before your eyes; the hum of thousands of happy bees, gathering the sweet nectar from the sea of bloom nestling among the beautiful green of the orange leaves, and the songs of the birds, many of which are warbling their sweet "goodbye" to their sunny winter home, in your ears; the air, laden with the rich-est of perfumes, in your nostrils, and a elbow, if you are a lover of nature (which all good bee-men must be) I think you would find yourself as near heaven as it is often man's lot to get

To the apiarist all of this is to result in barrels or crates of delicious honey; to the orange grower, in checks on New York, and a good many little surprises and pleasures, and comforts for wife and little ones, coming in return for great piles of crated fruit to be sent to

market in the fall.

The realization of a part of this happy picture is still in the future to the writer, as my grove is still young, and now blooming for the first time, but a short time only is wanted to tinish it out. The out. This morning I picked as high as 400 buds and blossoms from one tree which I set out 21 months ago, and which is now but 19 months old from the bud. I have several others of the same age with nearly as many upon the bud. same age with hearly as many upon them. I pick quite a large number of the buds off to prevent the tree from bearing too heavy a crop the first year. One of my neighbors has a grove, set out 6 years ago next August, which has trees in it that bore 800 oranges each last year, and, judging from the bloom now on the trees, they will greatly exceed that number this. This orange business never promised better than it

it on the ground and shook all the When placed in the rays of the morning appearance in some honey in brood the season with, an extractor, a comb driven bees on to it; they clustered sun they remained motionless for a long combs, taken out of a depopulated hive foundation machine, a 113 gallon evaporator, and a 20x20 honey house, so 1 am well prepared to take advantage of am were prepared to take advantage of the coming crop. Last year I started with 14 colonies, increased to 40, and extracted 1,900 lbs. of honey, which brought in the Boston market 15 to 20 cts. more per gallon than any other honey there at that time, and this withont a pound of foundation. This year I expect to increase to 100 colonies, and extract 7,500 lbs. of honey. I will report my success next November or December.

I am constantly receiving letters of inquiry in regard to this State as a field for bee-keeping, and many have no stamps inclosed for reply. As 1 have no land or bees for side, i cannot afford to find stationery, time and stamps to write on other people's business; so if any reader wishes further information, they will please enclose 2 stamps, and I shall be pleased to give it.

New Smyrna, Fla.

For the American Bee Journal.

#### Making Comb Foundation.

яміти *&* яміти.

Beyond dispute, comb foundation has become a necessary article, and it is unnecessary to state the advantages in the use of it. There is room, however, for improvement in the way of making it. will say a few words on that sub-t. Every manufacturer of comb iect. foundation knows the amount of time and patience required in stopping the machine after starting the sheet of wax, and using a quill or brad-awl to pick up the end of the sheet, which is sure to adhere to the rolls, especially if the wax or the mill are too warm or too cold, etc. All these things are inclined to make the end of the sheet stick so much the tighter; in short, we find it takes about  $\frac{1}{4}$  of the time in stopping and picking up the end, ready to put the sticks on, to hold the sheet firm. This has been one of the disadvantages all have to contend with. The part spector we always declared a plan that on past season we adopted a plan that entirely overcomes the adhering. After starting, the sheet will go through; all we have to do is placesticks on the end, No time is lost in picking it up, and there is no risk of injuring the dies by the use of a brad-awl, etc. It saves time, and is in no way injurious to the foundation.

#### Tennessee for Bee-keeping.

A. II. BRADFORD.

Here in the South I have never known a colony of bees to require winter protection, and I have never known a hive to freeze out, and not many starve. Our hives stand out and take all sorts of weather from year to year, all sorts of weather from year to year, and very often when winter has fully set in and the earth is covered with snow, here in West Tennessee 2 or 3 bright sunny days will warm them up so that they will stir out and fly around full of life, cleaning out their hive and hunting for something to gather up ontside; and when the little crocus peeps out through the frosty atmosphere of early spring, the little worker is the first to notice it, and every flower is soon covered with the hungry little fellows, striying for the first sip of defellows, striving for the first sip of de nenows, sativing for the first sip of de-licious nectar. Every bee fancier should have a good plat of this sweet little harbinger of spring for his bees, if nothing else. Soon after this, the au-lonia, that prince of shade trees, with its wide spreading branches and long sukes of fragrant purple flowers for spikes of fragrant purple flowers, furnishes another feast of good things. The maple in its varieties, and the willow of the woods, come in time to save the weak colonies, and I have hardly ever had to feed them in winter or spring.

The Northwestern Bee-Keepers Association will meet in Chicago on Tuesday and Wednesday, Oct. 11 and 12. All bee-keepers are cordially invited to attend. It is desired to make vited to attend. It is desired to make this one of the most interesting Conven-

tions ever held in the United States. C. C. MILLER, M. D., Pres.

#### THOMAS C. NEWMAN.

EDITOR AND PROPRIETOR,

CHICAGO, ILL., JUNE 15, 1881.

#### The Honey Prospects.

From many quarters we are receiving very gratifying news regarding the incoming honey crop. Of course, to the north of us the nectar flow has hardly commenced, but everywhere the prospect is encouraging for a good yield proportionate to the bees surviving. Dr. C. C. Miller, of McHenry Co., Ill., says: "Bees are building up finely; prospects for an excellent season." C. F. Muth, Ohio, writes June 8: "Locust blossoms vielded more than ever before to the best of my knowledge. I took off more than 1,000 lbs. of locust honey 10 days ago. Bees are now filling up slowly with clover honey. We want warm, dry weather for the next 2 or 3 weeks to produce a large crop." Osman McCarthy, of Pennsylvania, writes enthusiastically regarding prospects in that State; John Boerstler, Central Illinois, "forced the season" with 20 natural swarms in May and 10 in early June; while W.S. Hart, Florida, becomes poetical in his contemplations. W. P. & Frank Coffinberry, Arkansas, write that the prospect for a heavy spring yield is discouraging, on account of heavy rains; but all the signs for a large fall harvest (which is the main dependence there) are propitious. Here, the hot weather scorched white clover to some extent, but sweet (melilot) clover was never more promising.

The editor of the Nebraska Farmer says: "Our first swarm came out on May 23d. It was very large. How is that for Nebraska, in a late season, too? Our former estimate of the loss of bees in this State, by the severe winter, was much too low, as later reports show. We now think that 4-5 in all the State perished."

We are pleased to learn, by the Red Oak, Iowa, Express, that Mr. E. D. Godfrey, who is a progressive and successfull apiarist, has been appointed a special agent of the Interior Department. We congratulate him on this "progressive step."

Mr. D. S. Given, Hoopeston, Ill., made us a very pleasant visit on the 10th inst. He reports the prospect for a good honey yield as very encouraging. We regret to be obliged to announce that Mr. Given is suffering from ill health, which he attributes to over-work.

The Nebraska Convention.—The Nebraska Farmer says:

At the last meeting of the Nebraska State Bee-Keepers' Association, Ashland was chosen as the place to hold the next meeting; that place seeming to represent nearly the centre of the bee-keeping population of the State. It is to be hoped the bee-keepers of that place will take hold of the matter and make the necessary arrangements for the meeting; without doubt it will be the largest meeting the Association ever held. Our last meeting in the city of Plattsmouth was an honor to the Association. Let us not "put our hands to the plow and look back."

#### Present and Future of the Weekly.

The opinions of our subscribers concerning the Weekly have approved it so unanimously that it has been quite surprising. This shows how much of a necessity it had become. With the exception of those who incidentally remarked that they preferred the old size and form, the following are the only ones who have written disapproving the size of the JOURNAL. These we have retained to see how many we could gather up and publish all at once. And even these only disapprove the shape of the pages, while they all, without exception, desire its weekly visits:

I like the Weekly. When first published I was not favorably impressed with it; but it is just as it should be. I did not realize that it could get such communications as it does. Some of the monthlies have to borrow a good deal from the agricultural and other bee papers. This is a little humiliating to the editors, I should think. Best regards.

F. A. SNELL.

I was slow to see the propriety of the change, but the weekly visits of the Journal have convinced me. It has been a great satisfaction to me to get reports every week of the effects of the extraordinary winter upon the bees, and the different modes of wintering, in all the different parts of the country.

LEROY WHITFORD.

Being a subscriber of 11 years' standing, and an occasional contributor to the Bee Journal, I hail, with pleasure, the advent of this cherished publication as a Weekly. But at the same time it is with great sorrow that I see the Journal changed from its life-long, convenient form. I should prefer to have had the Journal remain a Monthly, even at a higher price, rather than have its form changed. But I might as well think of getting along without my daily meals, as without the Bee Journal.

WM. MUTH-RASMUSSEN.

I am very sorry that you have changed the size of the Journal, as I considered the American Bee Journal for 1880 was perfection in size and form, paper and printing. The present size of the Journal is inconvenient to read, and not fit to leave on the drawing-room table, and when bound it will make such a cumbersome book it will have to be thrown upon the bottom shelf of the bookcase, out of sight, whereas the old size was handsome enough to leave on any table, and was placed on the most conspicuous shelf in the bookcase. I have all the 16 volumes complete, and I often show them to my numerous bee-keeping friends, and by that means I have induced many to become subscribers of the good old American Bee Journal. I do hope you will change the size back again to the old form. I have made these remarks because I am so anxious for the continued success of the Bee Journal.

I approve the change from a Monthly to a Weekly, but record me as unalterably opposed to its present size and shape. It is inconvenient for reading and preservation. I am always glad to receive the Bee Journal, but greatly desire it in its old form and shape. My interest and pride in the Journal impel me thus to write.... J. W. llubson, M. D.

The Weekly Bee Journal supplies a want long felt by bee-keepers. Mr. Samuel Wagner, before his death, contemplated a semi-monthly, but nothing less than a Weekly would now give satisfaction. Let me suggest that the shape is not the best for preservation. It looks too much like the ordinary newspaper, and will often share its fate. I take it for granted that no change of form can be made for this year—but would it not be well now to announce that another year the shape of the Bee Journal will be such as to obviate all objections.

L. L. LANGSTROTH.

I am well pleased with the change of the Bee Journal to a Weekly, except the form, which is not so convenient for keeping for future reference. I would

prefer to pay more and get a more convenient size. The amount we pay for the Journal is nothing compared with its real worth, and to lose a copy is like losing a link out of a trace chain on a hard pull. My Journals never go to the waste basket, like other papers, but are carefully preserved for future reference. One of these old Journals saved me a colony of bees, and that colony gave me \$10 in surplus that season—5 years' subscription from a single article in one back number. When it will justify, I would ask the publisher to give us a more convenient form, and we will pay for it. If the cost is greater, the benefit derived and the time saved will overbalance that.

John M. Davis.

We are very glad to have these friendly criticisms, and have given them due consideration, and will, after the expiration of the present year, greatly enlarge the Weekly BEE JOURNAL.

This year, it was an experiment, and we desired to give as much matter as possible, and at the same time not to make it so expensive as to cripple its career. Now, as it has received such marked approval and assurances of continued patronage, we shall endeavor to satisfy all, as to its size and shape, for another year.

We propose next year to drop off one column from the page, leaving 3, and reduce the length about 2 inches, making the size not only unobjectionable, but a very handsome and attractive one, and also double the number of pages, and continue it weekly, at the same price as now—\$2 a year.

Those who have purchased Binders for this year, will then have a nice volume already bound, and convenient for reference.

We shall also bind the Weekly numbers every month, and issue it in Monthly parts, of from 68 to 84 pages, according to the number of Wednesdays in each month, at the same price as now, and thus accommodate our large list of foreign subscribers, and others in America who may prefer to have it in that way.

The following indorsements are also received:

I am much pleased with the Weekly Bee Journal. It keeps its readers up with the times. Henry Crist.

I like the change to the Weekly very much—it was too long to wait for a Monthly.

J. C. Pennington.

I consider the Bee Journal so full of practical information that no one should be without it who has the care of bees.

Chas. Smith.

I find myself looking for the Bee Journal with much more interest since it became a Weekly. E. E. HASTY.

The Weekly is simply "immense."
I have received all the numbers so far.
J. H. Baldwin.

I am well pleased with the Weekly Bee Journal. I like its general appearance as well as its contents. It ought to meet with much success. HENRY ALLEY.

I am delighted with the neatness and richness of the Weekly Bee Journal. It is very comprehensive and interesting and I wish it great success.

(Rev.) A. GUNTHER.

Allow me to congratulate you on the handsome appearance of the Journal. Success to it and its proprietor. John W. Lockin, Ed. Wis. Farmer.

The American Bee Journal makes its Weekly visits and is just what is wanted. Success to its enterprising editor.

Anthony Opp.

I find the Journal as interesting as my husband does and we both like the Weekly very much and wish you all success.

Mrs. W. L. Portfr.

We admire the change of the Bee Journal to a Weekly very much indeed. FLOURNOY & FOSTER.

I am well pleased with the Weekly. Its publication is a great stride in scientific apiculture. Long live the Bee Journal and its genial editor.
G. W. ASIBY.

I like the Bee Journal very much and would not be without it for 8 times its price. ERNST ZABEL.

I think the Bee Journal the best in the world, and it is better and better every week. ISAAC F. PLUMMER.

I like the change from a Monthly to a Weekly very much. II. B. Lisk.

I was agreeably surprised with the

I was agreeably surprised with the Bee Journal coming Weekly. I would not do without it for 5 times its price.

GEO. A. TEMPLE.

The Weekly Journal is not only progressive and fully up with the times but it is decidedly excellent.

II. S. VAN ANGLEN.

Success to the Weekly Journal. We are all well pleased with the Bee Journal except the form. We think the old form much preferable.

S. L. Dorsey.

I am much pleased with the Bee Journal and am glad that it will be a weekly visitor instead of a monthly. This will be appreciated by all its patrons.

J. M. WEEDE.

I am well pleased with the change of the Bee Journal from Monthly to Weekly. May it ever prosper. M. B. TERRASS.

#### INDIANA FARMER.

Putting on Surplus Boxes.—Pulting on surplus boxes like many other things connected with work in the bee-yard, is dependent on conditions and circumstances. The experienced eye can easily tell just when they should go on. The cells unoccupied with brood will be filled with honey, and the bees will have commenced building little patches of comb in all the unoccupied space, lengthening out the cells next the top bars, etc. This usually commences at the yield of white clover, and in many localities they will need the boxes ere this. They should not have too much room given them at the start; put on a few at first, and as the bees get started in, give them more room.

Dividing Becs.—Dividing bees, when properly done, is a much better plan to increase than to allow them to swarm naturally. But improperly done, has been the ruination of many an apiary, for it seems almost impossible to convince some people that success depends on the strength of the colonies, and not numbers. The better plan is to wait until the bees are making preparations to cast a swarm, and then they can be divided with benefit. When you find they are making ready, or have queen cellscapped, then divide. Take a frame of honey, bees, brood, and the queen, hang in an empty hive, fill up with frames of comb or foundation. Move the old hive to a new location, placing the new hive containing the queen on the old stand, and the work is done. Nearly all of the old bees and those in the fields at work will return to the old stand, which now contains the new hive, and makes quite a good colony. The young hatching bees will soon fill up the old hive. The empty place from which you removed the frame of brood and the queen, should be filled with a frame of comb or foundation; for if an empty frame be hung in place, the bees will fill it with drone comb. This work should be done in the middle of the day when the larger part of the bees are in the fields. Nothing can be done for 7 or 8 days with the old hive. By that time they will have capped the queen cells: if the cells were capped at the time of dividing, they will need looking after sooner than this. The queen will hatch in 15 days from egg. When the young queens are ready to hatch, all queen cells should be removed but one;

those removed can be used in nuclei those removed can be used in nuclei previously prepared, or be given to colonies divided a few days in advance of the hatching queens. If no other colonies are ready to divide, make nuclei by taking 2 or 3 frames of brood and bees from prosperous colonies, and to give them the hatching cells. The nuclei should be made the day previous, as they will then more readily accept the cells. Young queens will hatch and become fertile while occupying these nucleus colonies, and can then be built nucleus colonies, and can then be built up from other colonies, or be given to divided swarms, keeping the old colony to gather and at work until the young queens are ready.

Starters in Surplus Boxes.—Bees commence work much more readily in surplus boxes, when provided with starters of comb or foundation. All clean white comb should be carefully saved for this suppose. The largest the starter that purpose. The larger the starter, the better, but even a very small piece is of great benefit. Where pieces of comb are used, it can quickly be fastened in the box or section, by holding it over a candle or lamp until the edge is melted, then sat it in alone and it will stick; candle of ramp finth the eage is never, then set it in place, and it will stick; for foundation, this will not work so well. We use the following, which is very simple and effectual: Take a tin dish, an oyster can with one side cut out does admirably, fill part full of beesout does admirably, in part third bees-wax and rosin of equal parts. Fix the dish over a lamp, so as to keep the mix-ture at the right temperature, which you will soon learn. If too hot, it will melt the edge of the foundation. If not sufficiently heated, it will cool be-fore you can get the stayter in place fore you can get the starter in place, and will not stick. Have your starters all cut the right size. Take the section all cut the right size. Take the section in the left hand, top down, dip one edge of the starter in the wax, and set in place, and it will stick. With a little practice you will be able to do this requirement. very rapidly.

Building Combs in the Open Air. -Mr. Frank Cheshire, in the London Journal of Horticulture, says:

Mr. Benton apologizes for Apis dorsata in these words—"We must not be prejudiced against the bees because they build their combs in the open air. Our yellow bee closs the same thing in tropical countries, and when unable to find a suitable place to settle." I am glad to be able to corroborate Mr. Benton by an instance of this, the evi-

dence of which still exists.

In the beginning of September, 1874, the Hon, and Rev. H. Bligh discovered a colony of Apis mellifica (our common colony of Apis mellifica (our common colony). bee) in a privet bush near Henley. That the insects had been at least some weeks established was certain, for not only had a large quantity of worker comb been built, but in a good patch of drone comb the cells were stained by the exuvise of the males that had already left them, while a second set of larvæ were far advanced. Since 25 days are occupied in maturing a drone from the aggrand Sor a more would be days are occupied in maturing a drone from the egg, and 8 or 9 more would be required to bring the succeeding larvato the condition in which they were found, we have but 8 days left of our hypothetical 6 weeks for the bees to build much worker comb and then make preparation for colonizing by turning their attention to the production of

The handy work of this al fresco family was secured by cutting through the stems of privet and removing the combs stems of privet and removing the combs bodily, which was in no way difficult, as the whole of them had been tied together by interlacing twigs. I was honored by having this specimen presented to me by the aforesaid gentleman who discovered it, and a few times since it has been used at lectures or lent to grace collections of curiosities, and has, in consequence, suffered after and has, in consequence, suffered after the fashion of the Temple Bar Memorial-going in parts to the cabinet of the curious, or rather, perhaps, suffering under the thumb of the destructive; but enough remains to bear testimony to Mr. Benton's statement. The leaves appear to have been carved from the tiole by the clever bees, thus securing room for their combs, and many points to which to fasten them, so that the wind would not disturb their arrangements.

Bees Doing Well.—About <sup>2</sup><sub>3</sub> of the bees in this section are dead; some have lost all. I have 19, in good condition, left out of 50 last fall; wintered in the cellar. Had I followed more closely the instructions given in the JOURNAL from time to time, I might have fared better, I think. Still I feel very thankful for so many to start with, this season, and am honeful for the futhis season, and am hopeful for the fu-ture. JOHN MEADER. Delaware, lowa, June 2, 1881.

Metilot Clover.—In Cook's Manual, page 230, speaking of melilot clovers, the author remarks "another disagreeable fact; they have no value except for honey." I have had 5 acres of melilot pasture for 7 or 8 years, and 1 give it as my opinion from experience, that 1 acre of melilot clover will furnish as much pasturage as 2 of any other grasses in common cultivation. Stock will eat it, after becoming used to it, as freely as blue grass or timothy, and its fatting qualities, from a casual observation, judge to be equal to any.

A. SALISBURY.

Camargo, 1ll., June 6, 1881.

Foul Brood.-Allow me to suggest Foil Brood.—Allow me to suggest that the recent articles on foul brood in the BEE JOURNAL should not pass without some editorial comment. The difference between chilled brood and fonl brood is too well known to most of the older bee-keepers to need any explanation, but many of the beginners may be frightened into the belief that they have foul brood on their hands by they have foul brood on their hands, by reading such articles from men who evidently never saw a case of genuine foul brood. I have lived and kept bees toul brood. I have lived and kept bees for 10 years, in one of the worst foul brood infested districts of this State, and know the disease from sad experience; have also seen chilled brood, and do not see how one familiar with both cases can mistake one for the other. WM. MUTH-RASMUSSEN. Independence, Cal., May 20, 1881.

[The above subject has been quite ably discussed in the BEE JOURNAL, and our columns are still open to receive any new ideas which may be advanced pro et con. Perhaps in the multiplicity of ideas the correct solution of the problem may finally be reached, and its cause, prevention and cure be thoroughly understood by every apiarist.—ED.]

"The Harvest is Great, but the Laborers are Few."—The harvest is fast approaching; the locust trees are in full bloom, so white are they that they present the appearance of snow, and rival that of harverselin pickness, and return the state of the same and the state of the same and the state of the same and the same and the same are same as the same are same are same as the same are same are same as the same are same as the same are same are same as the same are sa that of basswood in richness and nectar. White clover is just coming, and promises to be abundant: but alas, the reapers are few, although the loss in this locality is not so bad as reported in some cality is not so bad as reported in some others, but it is bad enough. As near as I am able to judge from reports, nearly 50 per cent. of the bees in this locality are dead, and a great many of those living are very weak. It matters little how good the season may be, but little surplus will be the rule in this locality. Southwestern. Panneylypaid. and the prospect is promising now. Last fall I had 16 good colonies (6 Italians and 10 blacks), and now I have 2 in moderately good condition. Five of the Italians were packed in dry hay and leaves, on the summer stands. I had 4 colonies in the cellar, one Italian and 3 blacks the remainder out-ofhad 4 colonies in the cellar, one Italian and 3 blacks, the remainder out-of-doors, unprotected. By the last of February all that were out, unprotected, and all that were in the cellar, except the Italian, were dead; some seemed to be affected with dysentery, while others did not. Those packed as above described, came through the winter all right; all but 2 of them lost their queens before the last of April; had it not been for this I would have had all my Italians yet. However, I saved 2 of the queenless colonies; they reared some the queenless colonies; they reared some

tor 5 queens each, and just before they hatched 1 divided them, making 4 nuclei out of the 2; each nuclei now has a queen. I examined them yesterday and found one of the queens laying; the others are fertilized, I think, but are not yet laying. Bees in this local-ity are generally wintered on the summer stands, unprotected; I am the only one that has tried packing and cellar wintering. Some have lost all, or nearly so, while others came through all right; One neighbor had about 30 colonies and now has 5; 2 others had 20, now one has none, the other 3 or 4; another one had 2 colonies, both came through all right, and are the stronest I have seen and are the stronest I have seen this season. Yesterday a swarm issued from one of them; they are in box bives. Permit me to say, I am highly pleased with the Weekly. It is just what every bee-keeper needs.

OSMAN McCARTHY.

Zollarsville, Pa., May 30, 1881.

Glucose as a Honey Plant.—I do not believe a word that "Hix" says about glucose being a good honey plant (see page 154 of the BEE JOURNAL). I guess he is an own cousin to Petroleum guess he is an own cousin to Petroleum V. Nasby, and the next thing we expect to hear of him is that he will be wanting to start a post office in some glucose factory, so that orders for glucose seed may be received with the least possible delay. Let us see about the glucose honey plant. Our friend, A. I. Root, has always been a strong advocate for the plant, and advertises the seed (grape sugar) for sale at 5 cents per lb. Well, he had 300 colonies of bees last fall. He sold a few and doubled the remainder down to 140, just bebees last fall. He sold a few and doubled the remainder down to 140, just beon April 22, he says in Gleanings, "we have but 12 colonies left, 5 of which will probably pull through without help." Either that neighborhood was appreciated in the probability of the proposition of the probability of the proposition of th overstocked, or else glucose is a very poor honey plant; and it is not safe try and winter bees that have worked on glucose. But I am too fast; in the May number of Glavings he says: " it was raising queens that did it." Well, if it costs the loss of 300 colonies of bees to rear dollar queens, I believe I will not try it. Have the colonies will not try it. Have the colonies where these queens have been intro-duced fared any better? If not, will it not pay us to improve our bees till they can stand it to be wintered on the summer stands any winter. I claim this can be done with the use of chaff hives, and until this is done, we shall not make bee-keeping a success. We can-not stand such fearful losses as we have had during the past winter and make bee-keeping pay. I wintered on the summer stands, the past winter, with-out the loss of a single colony, and have no more fear of wintering out-of-doors than I would in the best cellar in the world. I know I have made a great world. I know I have made a great improvement in my bees, and if you wish an article on improvement and how it can be done, I will write one soon, giving my experience and success.
L. R. Jackson.
Fairland, 1nd., June 4, 1881.

filive us the article, by all means. We want all the light there is, and if Mr. Jackson can tell us how he has improved his bees we shall all thank him for the light.—ED.]

A Cellar Best for Wintering. -1 saved a Certai Dest in Minering.—I saved 5 colonies of bees ont of about 30, which 1 think is tolerably well, considering that so many have lost all. I wintered out-of-doors. Had my bees been put in a good cellar I think that I should have saved more than double that num-ber. I have wintered bees in a cellar ber. I have wintered bees in a cellar for 6 seasons, but on account of having moved I have no cellar now. My experience teaches me that a cellar kept at a temperature that will keep the bees quiet is the place to winter bees. All the protection my bees had was straw in the caps.

Waveland Ind. June 7, 1881. Waveland, Ind., June 7, 1881.

Gathering Honey.—I had 20 swarms in May, and 10 in June. The bees are working finely, and have gathered con-siderable honey. JOHN BOERSTLER. Gilead, Ill., June 7, 1881.

Prospects Flattering.—My bees are doing finely. They came through the winter with the loss of one out of 11 colonies. All were packed in chaff on the summer stands. The one lost lacked honey, Good honey, plenty of bees, and chaff packing are the essentials in wintering bees here. The prospects for an abundant honey yield are peets for an abundant honey yield are flattering. I cannot do without the BEE OURNAL. J. W. CARTER. Pleasantdale, W. Va., June 4, 1881.

Honey from the Locusts.—1 saved 68 out of the 80 colonies I put into winter quarters. These outstrip anything I ever beheld for gathering honey from locusts; during their blooming the bees locusts; during their blooming the bees filled every available cell with honey, clear as crystal and of excellent flavor. I think we shall have a nice honey crop this year; as about ½ of the bees are dead, if there is anything in having "an undivided fleld" for our bees, we should have an excellent crop of honey. White 

Mullberry, O., June 4, 1881.

Wintering in Cellar.—Pather has kept bees for several years. He winters in a cellar, and would winter in no other way in this latitude. He says he thinks that it is just as easy to winter bees successfully as it is to winter cattle and sheep. He put 73 colonies into the cellar about Dec. 1, and took them out April 21, all alive but 3. One starved, and the other 2 smothered from the entrance being closed. A few colonies became weak in the spring, but by doubling them up they are getting strong, for the boney harvest. Most of the colonies are very strong, with quite a number of drones tlying. Not desiring any more bees than he can take care of himself, father restrains them from Wintering in Cellar. - Father has kept ing any more bees than he can take care of himself, father restrains them from swarming as much as he can. Some colonies which did not swarm last year averaged from 75 to 100 lbs. of comb honey, while those that did swarm averaged from 50 to 60 lbs., besides some extracted honey. He keeps nothing but hybrids, and uses the Langstroth live. I will give his method of winterbut hybrids, and uses the compensation live. I will give his method of wintering bees and preventing robbing, in some future number of the Journal, if wanted. Being a carpenter, he makes all his own hives and surplus boxes, and also rears his own queens, so he ought to succeed in the business. We read the Bee Journal, and do not see how we could get along without it. Pa how we could get along without it. Pa takes it out among his pets and reads it through: I do not know which likes it the better, he or his pets; they will light upon it sometimes as if they were trying to read it, too.

CARRIE M. CHARLES.

Cedar Falls, Iowa, May 27, 1881.

Locust Bloney.-The locust bloom yielded more honey this season than I ever before knew it to do. I obtained more than 1,000 lbs. of it nearly 2 weeks ago. Bees are now filling up their hives slowly with white clover honey. They gathered more yesterday than all last week. We need warm weather for 2 or 3 weeks to yield a honey crop. C. F. Muth.

Cincinnati, O., June 8, 1881.

#### CLUBBING LIST.

We supply the Weekly American Ree Journal and any of the following periodicals, for 1881, at the prices quoted in the last column of figures. The first column gives the regular price of both;

The Weekly Bee Journal (T. G. Newman) \$2.00 and Gleanings in Bee-Culture (A.I. Root) \$3.00, 2.75 Bee-Keepers' Magazane (A.J. King), \$0.02 £0 Bee-Keepers' Exchange (J.II. Nellis), \$2.50, 2.50 The 4 above-named papers, \$4.75, 3.75 Bee-Keepers' Instructor (W.Thomas) \$2.50, 2.25 Bee-Keepers' Instructor (W.Thomas) \$2.50, 2.25 Kansas Bee-Keeper, \$2.50, 2.35 Kansas Bee-Keepers, \$2.50, 2.35 Kansas Bee-Keepers, \$2.50, 2.35 Kansas Bee-Keepers, \$2.50, 2.35 For Seni-monthly Bee Journal, \$1.00 less For Semi-monthly Bee Journal, \$1.00 less. For Monthly Bee Journal, \$1.50 less.

#### Wintering Bees Successfully.

WM. LOSSING.

The wintering of bees seems to be the all-important question, and how they can be wintered the most successfully. My experience teaches me that each colony should contain a young, prolific queen—Italians preferred. If you have any queens more than 2 years old, remove them about the 1st of September, and introduce young queens in their places, which will furnish plenty of young bees to stand the winter. Each colony should have not less than 20 lbs, of ripe honey at the commence-ment of winter. Out a half-inch hole through the center of each comb for the bees to pass through. From No-vember 1st to 15th, remove all the honey-boards and in their places spread quilts made of 2 thicknesses of cotton flannel. Now your bees are ready for the cellar, which should be put in order.

To prepare the cellar, remove all

pickles, vinegar, soap barrels, etc., then lay a tier of dry bricks on the bottom to take up all the moisture; now build racks to hold your hives, so that you can examine any one hive without disturbtwo 4-inch pipes, one to run from the cellar to the chinney, or stovepipe, the other to run from the cellar to the other to run from the cellar to the outside. Each pipe should have a damper in it. in it, that you may regulate the tem-perature as desired. Hang your therperature as aesired. Trang your thermometer in the cellar, and keep as near 10 as possible. Now, carry your bees and place them in the racks carefully, and the work is done.

If, during the winter they become noisy, give them a little more fresh air, which can be done by turning the dam-pers. If very warm weather, open the outside door during the evening until they quiet down again, dead bees from the Remove they quiet down again. Remove all dead bees from the bottom-boards, which can be done with a wire bent a little at one end; do not leave them in the cellar to decay and get mashed under your feet. Keep the cellar clean, dry, perfectly dark and well ventilated. complying with the above, I have no doubt but success will be your reward.

Rend before the N. E. Convention (N. Y.), and the S. W. Wis, Convention.

#### Profits of Bee-Keeping-Prize Essay.

GEO. W. HOUSE.

"How can we make the apiary the most profitable?" How to make the rofitable?" How to make the profitable can be answered by amiary many; but how can we make the apiary the *most* profitable is the desired object. and the goal to which all aspire. With all the experience and teachings of our leaders in apiculture, such as Quinby. Langstroth and others, we yet find diffi-culties to encounter. They have opened up many new ideas, have given us light in many dark places, settled doubts, and added much to our present Italy has furnished as success. Tany has infinished as a su-perior race of bees: America, the mov-able frame hive, extractor, comb-foun-dation, and many other useful appliances. But with all our knowledge, experience and implements, we have not yet reached that desired haven "uniform success and profit." During the past 20 years we have accomplished a great deal, but our knowledge of apiculture is not perfect, and we have much yet to learn.

Who can say, in view of what is passing before us in every direction, what the unattainable may be? But how can we secure the largest net profit from our investment is the desideratum of our essay. But with all our knowledge, ex-

tum of our essay.

To do justice to our topic would require much time and space, as it cm-braces the whole season's work; in fact, everything pertaining to labor and expense attendant to the science of api-

apiary from spring until fall.

First, then, we must lose sight of the aparty from spring until fail.

First, then, we must lose sight of the debtor side of our expense account, and in doing this, we must exercise good judgment. In furnishing our necessary upplies and implements, we should endeavor to lessen our expenses wherever an opportunity is offered, remembering that a dollar saved is a dollar earned. For fear this saving might be carried to extremes, the successful apiarist should remember that in some instances an ontlay of a few extra dollars in some particular direction, he may add largely to the profits of the season's labor. we can increase the value of our products by expending a small amount, or if we can secure a larger yield of honey with a little extra time or money, we should not be backward in taking advantage of the situation. In complying ge of the situation. The company of these requirements, no fixed rule be given to govern us. We should can be given to govern us. We should strive to have our products in the neat est and best shape of any on the markets; and by a close observation of the demands, together with a little study, we can keep the lead. Apiarists that keep fully up to the times, are the ones who realize the most money from their products. In connection with this part of our essay concerning expense, I would recommend that some action be taken by this association, whereby we would be enabled to purchase our necessary supplies at a large discount, and be of mutual benefit to the members. This can be accomplished by appointing a committee, whose duty shall be to take orders from the members for glass. nails, boxes, crates, comb foundation and the various other supplies. To open correspondence with the manufacturers and send the orders to the lowest bidders.

We will now take up the management of the apiary from the time the bees get the first natural pollen. At this season of the year, we find some colonies strong—others in fair condition, and some in poor condition. Some will wint feeding, others room for brood-rearing, while more will need to be strengthened in numbers, and per-haps a few are in various other condi-tions. Those colonies that have insufficient stores, can be supplied from those having an abundance. Others that are weak in numbers can be made strong by giving frames of broad from the strongest colonies, and inserting in their place frames of foundation or empty comb. Then there are numerous other manipulations of the hive that re-Then there are numerous quire immediate and skillful treatment. which time and space will not allow of our giving in this paper. Furthermore, there is no one system of management that can be given for the various condi-tions of the hive. Circumstances and locality alter cases, therefore the apiarist is forced, to some extent, to exercise his own skill and judgment. We should his own skill and judgment. We should aim to have our colonies strong in numbers, and as near alike as possible, by the 1st of June for this locality. By this time the boxes should be in place, if working for comb honey, or if workin working for comm noney, or it working for extracted honey the surplus arrangement should be in position. In fact, everything should be in readiness to secure the flow of honey for the following 6 or 7 weeks. From past experience, 1 believe the apiary should be worked for both comb and extracted honey, to make our pursuit the most profitable. Every bee-keeper is aware that some colonies will store honey in the boxes, while others can hardly be forced to commence work in the boxes, conditions being equal. Hence it will be seen that some colonies will be most profitable when managed for comb honey, while others would give the largest returns with the extractor.

Here again, many manipulations of he hive are required that space will not permit giving. The whole may be summed up in these few words: See that the bees and queen have plenty of room at all times during the flow of honey. But you say we are now in the midst of the midst of the swarning season; what amount of increase is desirable? If more bees are desired, or if the apiarist is so situated that he can readily dis-pose of his increase at a fair price, I would advise taking I colony from each culture. But as prizes are offered for pose of his increase at a fair price, I planned out, and from that time until (essays on other important subjects, I would advise taking I colony from each to-day bee-keeping has been regarded presume it was intended that our theme old one that is sufficiently strong dur- as a science. Scholars have studied its

should cover the management of the ing the month of June, and the first few apiary from spring until fall.

Eight then we must lose sight of the the dane artificially. If second swarms days in July. This swarming should be done artificially. If second swarms should issue, put them into any other hive that is queenless, and you will be surprised to see how they push the work in the surplus boxes. If we have all the bees we care for, I would advise as little increase as possible. The most practical, and, I might say, the most profitable mode of increase for those in such circumstances, would be as fol-

> Form nuclei by taking frames of brood and bees from your strongest colonies, putting them in new or empty hives, contracted by division boards. When they have a laying queen, they may be built up to the desired strength by removing the division boards and giving frames of brood, drawn again from our strongest colonies. Frames foundation should be inserted in the place of the frames of brood, thus taken ont. By this mode, we not only have a laying queen in all our colonies at all times, but we secure a rational increase, and prevent nearly all desire of swarming. Our strongest colonies are thus given more room for the queen, and in a few days the new swarm will be among our strongest and best surplus honey colonies.
> It is estimated that everything about

> the apiary, should be so arranged or constructed as to admit of quick working, etc. The hives, and everything pertaining thereto, should be of one size, that each and every piece may be interchanged with other hives when de-

Read before N. W. Wis, and E. Minn, Convention.

#### The Progress of Bee-Keeping.

L. H. PAMMEL, JR.

Every age marks its scientific progress. In one a Michael Angelo has been produced, in another a Shakspeare, in another a Huber and a Reaumur. It was Michael Angelo who studied to get the loftiest position that could be at-tained in Greek and Roman sculpture; to Shakspeare we owe those noble and passionate thoughts to be found everywhere in his works, and still more his works are the foundation of all that which is noble and eccentric in the Engthe blind naturalist, for many valuable discoveries which he made in bee-keeping, as we also do to Reanmur, the inwentor of the thermometer. Progress is, therefore, not confined to one age or a single class of individuals, but spreads its banners far and wide, where luxury, pride and ambition reign, or where some renowned hero, his country's pride, falls a helpless victim of immortal renown. It was thus in the age of Casar, that Brutus and Socrates displayed their eloquent thoughts on science, art and politics, while Homer and Virgil were engaged in studying the natural history of the bee, and to them we owe the ear-liest tradition of anything relating to its nature. In this age literature as well as art had attained a high degree of peras at that attained a light legister of per-fection, while all the industrial purshits of man were yet in their infancy. The bees were hived in the trunks of trees, and the peasant followed the rude wooden plow. Virgil could say somewooden plow. Virgil could say something poetically of the bee, but of its natural history he was entirely ignorant. He should be excused, however, as it was a fault of the times.

as it was a raint of the times.

During the middle ages, when all Europe was in a tunult, nothing was done to develop the science of bee-keeping, as where the foundation had been haid (mostly Italy and Greece) bloodshed and terror reigned. This vast field of and terror reigned. This vast field of science laid idle until Unber thoroughly investigated each particular, and gave the world the benefit of his discoveries. Thus, it was Huber who first assumed that the queen could produce male eggs without the proper fecundation, and that the queen was fecundated in the air, where a drone could meet her. But the movable frame hive was an impossibility with him, for after repeated trials he failed to make one that would work satisfactorily. It was Dr. Dzierzon who perfected what Huber had so long planned out, and from that time until

wonderful mathematical skill, and the wonderful mathematical skill, and the naturalist has found much in the bee that is valuable for cultivation and preservation. Old notions have passed away. It used to be quite common to hear old bee-keepers say that "bees froze up solid in winter," which did not hurt them, and in which condition they required but little honey. Now the naturalist, as well as the bee-keeper, knows that the hee is a tender little greature. that the bee is a tender little creature, and deserves just as much care as he does bimself. If, therefore, he wants to reap a harvest from his pets, he must aim to keep his bees in the best conditions of life.

If Homer and Virgil were to arise from their sweet and quiet repose, they would be no more astonished to see the mighty engine with its unequalled power, that can make accurately the most delicate things with ease that no human hand or eye can excel, than to see one of our modern apiaries, where the movable frame is used; where queens are reared and comb foundation is ntilized. Wax, as we all know, is a production of the bee, thrown off apparently at will in little scales from the segments of the bee's body. A few years ago the most prudent bee-keepers thought it an impossibility for the queen to be fertilized under confinement day he knows she can be thus fertilized

The bee being the most intelligent of the insect creation, and so industrions and frugal in its work, it is no wonder that man has from times very remote until the present day, studied its natural history and peculiarities, and revered its noble use. Men of great learning and skill may aim to trace its origin or study its natural history, something of that noble insect will ever remain a mystery to mankind.

#### Top vs. Side Storing.

GREINER BROS.

We were highly entertained by the able discussions on the above subject by Messrs. Heddon and Doolittle. As they take the opposite sides of the question it gives an opportunity to profit by the argument; we have also experimented on the same question for the last 3 or 4 years, and can add a few more thoughts from our own observa-

When we commenced bee-keeping we adopted Mr. Heddon's plan; tiering we adopted Mr. Heddon's plan; tiering up, exclusively, for the production of surplus loney. Our surplus cases, or half-stories, are arranged to tier up, the top and bottom being alike accessible for bees, admitting the adjustment of any number, and are therefore virtually the same at Mr. Haldon's curring ally the same as Mr. Heddon's surplus

arrangement.
In the year of 1877 we transferred 8 colonies, and supplied 3 or 4 of these with sets of 9 four-pound glass boxes; we had, at that time, not adopted the 2-pound sections entirely, but experimented with different styles. A week mented with different styles. A week later we found these glass boxes about % finished; we raised them and adjusted one of our surplus boxes. In another week the latter was as near filled as the glass boxes were the week previous, but the boxes were not ye. finished. Of course another surplus case took the place of the first one; and this, with the 9 boxes, went up another story. By that time our hives had much the appearance of house chimneys, and we began to wish that our bees would finish some of the top commeys, and we began to wish that our bees would finish some of the top work. The next week we were puzzled; the last adjusted case was ready to be raised up again; the first one nearly, and the boxes almost finished, but none ready to be removed. In our

excitement we added another case, and had then a capacity of about 140 lbs, of surplus honey on those hives. When the season closed, nearly all this honey the season closed, nearly all this boney was finished, and we harvested from these colonies about 1,000 lbs, of comb honey, by the tiering-up plan. This we considered a success, and if Mr. Heddon can succeed in producing such amounts as he stated in the last number of April, he may well be satisfied with his plan.

The next year we began to practice artificial swarming, or, rather, divided the colonies, to prevent natural swarm-ing; we had not yet tried queen-rearing, but used capped cells for the queen-less halves. We noticed that these divided queenless colonies, while their queens were hatching and being fertilized, would store most invariably an abundance of honey in the brood-chamber, and we wished, time and again, that we had this overplus honey in sections. Our hives were arranged in such a way that six 5x5½ sections just such a way that six 5x5½ sections just fill the brood-frame (originally calculated for feeding purposes), and we conceived the idea that frames, the same width of, and filled with our sections full of each substituted for some same width of, and made with our strious full of comb, substituted for some of the brood-frames, might possibly help us out of the dilemma. The plant

tions full of comb, substituted for some of the brood-frames, might possibly help us out of the dilemma. The plan worked in many cases to a charm, and the starting point of our side-storing plan was established.

Mr. Heddon says: "To move sections from the side to the top is too much work." This we found to be true; the operation looks easier on paper than we find it to be in reality, and for this reason we have not yet practiced it very thoroughly; but what harm is there in placing, according to the size of the hive, one or more side-storing frames in the same, to be taken out again when the honey season is over? It gives the bees a chance to work at the side, if they choose to. We have taken hundreds of tinished sections from our hives in this way, which we considered an addition to our honey crop.

We can hardly agree with Mr. Heddon, to call it the wrong place; we always find the side-frames in the brood-chamber containing the most honey. Many solid side-frames of honey which we have recently taken from our perished colonies, are a proof that bees do not refuse side room for

from our perished colonies, are a proof that bees do not refuse side room for storing purposes, and we do not think that they possess the ability of discerning sections from brood-frames, but accept the former as readily as the latter, so long as they are in the same place. It seems that it is more in the immediate vicinity of the brood-nest that bees prefer, rather than the direction. The instance related above shows that they worked with the greatest rapidity in the case next to the brood-nest, less in the second, and hardly any in the third and fourth; for some of the glass boxes were never perfectly finished.

Mr. Heddon's assertion, "the well known fact that the very first place bees use in the spring, is in the top of the hive," does not indicate their objections to storing at the side. How is it, when we hive a young swarm into an empty box hive (which comes the nearest to nature's provision) that the first used is the top, and yet, when the inished, hive is filled and prepared for winter In our ling, we find, as a rule, that most of the

stores are at the sides? Is it not their natural inclination to work sidewise as well as in any other direction?

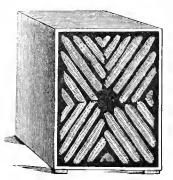

The size and shape of the hive, locality, season, etc., may have a tendency to make one or the other plan more practicable, but we are convinced that side-storing is a great advantage, and we should use some side-storing arrangement, even if we used a hive as shallow as the Langstroth.
Naples, N. Y., May 23, 1881.

For the American Bee Journal.

#### The Cause of Winter Losses of Bees.

HIRAM ROOP.

A friend wishes to know why I would rather have 100 colonies left out of 200 wintered out-of-doors, than to have 150 left out of the same number wintered in the cellar (i. e., that is the way I put it), and as I have had no reason I put it), and as I have had no reason for changing my mind, I will tell why. I had, in the fall of 1880, 156 colonies of bees in the best condition for wintering: as were all the bees in this part of Michigan. Thirty-eight of my colonies were in the winter-protector hive; the rest, 118 colonies, we put into a cellar, where I had wintered without loss during the past 10 years. As a result. during the past 10 years. As a result, I had on June 1, 1881, 19 colonies left from those wintered out-doors, and 21 left from the cellar; that I have kept alive by giving combs of brood and bees taken from the out-door colonies. Many of my friends know that this was my first severe loss as a bee-keeper, and I want to say that I am not dis-couraged, and while I do not wish to be on the contrary side, I must disagree with all that have offered theories as a cause for this mortality among our bees. When asked my opinion, I answer by asking what caused the yellow fever in

the South? the epizootic with the horse? Our bees and their honey were all right, but the weather was all wrong; i.e., atmospheric changes. One of our neighbors had, in the fall of 1871, 84 colonies of bees in box hives; the next spring all had died but one, and that one was strong and commenced swarming early. In the fall of 1880 he had 32 colonies in law hives, and lost all arring the colonies in law hives, and lost all arring the colonies. ing early. In the fall of 1880 he had 32 colonies in box hives, and lost all again, except the same old box, and that cast a large swarm on May 27, 1881; the combs in the box are built from each corner to the center (as shown in above engraving). I know of many more like instances but give this one for the benefit of that close, who think no further it of that class who think no further improvement in hires necessary Carson City, Mich., June 13, 1881.

For the American Bee Journal.

#### Experience with Comb Foundation.

JAMES S. LORD.

I have read the BEE JOURNAL for years and have noted all the articles on foundation, giving the good and bad points of all the different kinds. I tried points of an the different kinds. I then 2 kinds last year—the flat-bottom and the Root. Some of my hives take frames 10½x13 in.i.z.side, the long way up and down. I know this is the reverse of most of the frames in use, but I think in severe winters, like the past out that will winter been better than I think in severe winters, like the past one, they will winter bees better than shallow frames. I know they have with me, for I have both kinds,  $10\frac{1}{2}\times13$  and the Langstroth. I practice natural swarming and I cannot get foundation to stand the weight of a large swarm, unless it is wired, and I do not believe it can be made to stand, unless it is wired, on as deep a frame as mine. I tried 5 swarms on the Root, and it all fell down, some close to the top-bar and some an inch lower, and it nearly ruined the bees in 5 hives. I put 40 colruined the bees in 5 hives. I put 40 colonies on wired flat-bottom foundation, onles of wheel hat bottom formulation, 8 frames to the hive, and into 2 hives I put 2 heavy swarms each, and there was not a bad comb in the lot, and all were built out in a very short space of

time.
I did not see a full card of sealed brood; once in a while there was an empty cell, but not enough to make any material difference; I never saw a solid card of brood, even on natural combs, but I have seen brood in cells that the wire ran through, and I think the queen wire ran through, and I think the queen did not skip them oftener than she aid the other cells; still I think I should like foundation with a natural base better, if I could have it wired. The Given press will do that, but I must own a press because my frames are not according to the constitution of the c a regular size, and the dies must fit the trames.

I have 60 colonies of bees now on my raye of colonies of bees now on my sized frames and could not afford to change, and would not if I could. My hives are made to pack all around and over the bees in winter, and in the honey season I use side boxes, 12 onthoney season I use side boxes. If our side the frames. I get 56 4½x5½ boxes within 6 inches of the brood-frames, and I like them better than tiering up.
I do not like to run Mr. Hawley out, in the stingless bee enterprise, but I have any quantity of colonies that I will warrant not to sting.

Probably 90 per cent, of the bees in this section are dead. I have informed myself and will give the report of 8 or 10 who use box hives and single-walled hives:

No. 1, lost 20 out of 22; 2, 27 out of 29; 3, 80 out of 87; 4, 12 out of 14; 5, 7 out of 7; 6, 10 out 10; 7, 30 out of 30; 8, 60 out of 100; 9, 33 out of 36. Others have lost in about the same ratio.

I commenced the winter with 70 colonies; 10 of them in old hives that I did nies; 10 of them in old lives that 1 dd not have time to transfer, and the other 60 are in the "Genesee" hive. 1 did not pack the old coolies, and have lost 6 of them; the Genesee hives were all packed in planer shavings, and I have lost 5 of them. They had a flight on Nov. 10th, and did not have another until Feb. 10, just 3 months; this shows quite a difference in favor of the "Gen-esee hive."

Linden, N. Y.

For the American Bee Journal,

#### Are Bees a Nuisance?

J. H. MARTIN.

Mr. Heddon wishes for information about bees being a nuisance. There about bees being a nuisance. There has one case of the kind come to my knowledge. An apiarist in Vermont built up a very line apiary of black bees, and took pride in keeping it inorder, beautifying it with flowers and rose plants. He secured great yields from his 60 or 70 colonies, and was pros-

pering finely in the business.

This appary was located in a small hamlet of half a dozen houses. The nearest neighbor on the south was close nearest neighbor on the south was close to the apiary; the yard also faced the public highway. Neighbors on the south being so near the bees, members of the family were frequently stung, but our bee-keeper was indifferent to pains and swellings, and rather enjoyed the fun. There was so much complaint from this neighbor that our bee-keeper thought of the hrilliant idea of running thought of the brilliant idea of running thought of the brilliant idea of running a high board fence along the south side of his apiary, and within a toot of his neighbor's house. The idea was put into execution soon after being born, and 2 windows that were a pleasure to the feature to the family, were rendered useless and darkened by the high board fence.

The ire of the neighbor was aroused.

e knew that besides members of his family, members of other families on the north and horses on the highway had been stung. An organized effort was then made against the man with bees, and they were complained of as a

nuisance.

The selectmen of the town were called upon to investigate the matter. They came and hitched their horses upon the highway—one of the horses was stung, and the apiary was soon decided to be a nuisance, and the bee-keeper was compeiled to remove it to an orchard several rods from the high-The board fence, however, still stands.

Now, we claim that if our bee-keeper Now, we claim that it our bee-keeper had been upon friendly terms with his neighbors, and given them a pound of honey now and then to alleviate the pain, and had shown any sympathy whatever for their sufferings, his fine apiary would never have been removed; observer, and kindlyness countly have charity and kindliness would have made them friends and defenders, in-

stead of enemies.

This is the only case of bees being considered a nuisance that has come under my notice, and the bee-keeper bimself is clearly to blame.

Hartford, N. Y., June 11, 1881.

For the American Bee Journal.

#### Upward Ventilation.

F. H. MINER.

In a review of my former article on the above subject, Mr. Doohttle on page 65 of the BEE JOURNAL for March, says bees in a tree cut out the part softened by decay above and around toem, and glaze to get a good condensing surface to prevent absorption, which would deto prevent absorption, which would de-prive them of water, hasten decay, and ruin their work. He says "they go in at the top;" if so, they must be in a bad fix. All upward-ventilationsts agree they must have tight tops to maintain a breeding temperature in spring, but can breed very well in winter with a big the them, and the thermometer 30-below zero. He further says my predictions of "great losses are all groundless;" I wish it was so. True, groundless;" I wish it was so. True, they did not snother—with open tops, nobody said they would—but wore out creating heat. He calls my attention to the hollow tree. There is where I studied my lessons, and was under the impression he laid the losses to the old basswood-gum men. I have examined a great many trees, and inquired of been hunters and with very few expections. hunters, and with very few exceptions bees go in at the bottom or side; the decayed wood, kept dry by glazing, is a good non-conductor. He further says. good non-conductor. He further says, with upward ventilation the bees make

vacuum: the more heat they generate vacuum; the more heat they generate the faster it escapes, the movement be-ing determined by the difference be-tween outside and inside temperature. It is impossible to be comfortable in such a place; contraction is the resource, the increased consumption of honey and air, the sources of water, make too much, and it condenses and congeals too mear the bees, because our hives are cold, ill-shaped, too much radiating surface, and too thin. They perish in the cold season; cold and wet does it. Mr. Season; cold and wel does it. Mr. Doolittle does not believe in giving water—all right; nature does that if we do away with absorbents. He says they should not breed early, but nature takes no counsel of us; she has given instinctive foreknowledge we cannot safely interfere with. I find it difficult to confine them until pollen is plenty;

is warm, and get uneasy.

Mr. Doolittle says the majority of apiarists believe in upward ventilation:

The isomeomraging. I remember when that is encouraging. I remember when they were all that way, and I was a heretic. The writers, the masses, never adopted an error so contrary to nature. adopted an error so contrary to nature, and unknowingly took Francis Huber's advice to study nature. Burket says he has a colony which has been in a gum for 20 years, and with other old beekeepers says they are best to winter in; as they are spherical, narrow and easily warmed; the Deity sends them there for a home, and he knows almost as much as we do though we do not think so or we would not speed at the old log. gum Mr. D. speaks of a large hole near the top for the bees to go in and out, which prevented losses. Forty-one out, which prevented losses. Forty-one years ago I was green enough to try a fly-hole just under the cover. The bees made a stopper of their bodies to retain the heat for comb-building and breed.

the heat for comb-binding and breeding purposes, contracted the hole with propolis, allowed no ingress or egress, and used a fly-hole lower down.

The upward ventilation theory requires changes and attention which could not be given in a state of nature -a little water on a sponge, closing the op in the spring, etc. Thus, condition top in the spring, etc. Thus, condition must do for all seasons, and if ever practical, it is only in artificial circumpractical, it is only in artinical circumstances, while lower ventilation is adapted to all times and situations. The bees come out and go back, thus controlling the temperature at all times. Our frequent and severe losses, and the great difference in essentials between great difference in essentials between practical men, proves we have not much wisdom. I want no absorbents about my bees to hold moisture, because it will freeze and remain to keep them wet. I have tried many kinds of hives, and think the surplus water should go ant halow as in a state of nature. In out below, as in a state of nature. Un-less our teachers can tell me something better, I may go back to that old con-temptible log gum. I know they will winter there

#### Keeping Bees on Stilts.

W. G. P.

Mr. Hopeful concluded he would keep bees. He was fully persuaded in his own mind that it was the most foscinating and profitable avocation on losenating and promaine avocation on the face of the earth. Had he not looked through the "A B C of Bee-Culture," and digested several whole chapters of Cook's "Manual of Bee-Keeping," and fairly got the "Blessed Bees" by heart? Could he not expatiate upon the wanderful argonyalishments of the by heart? Councille not expande apon the wonderful accomplishments of the winged insect—the busy bee—and even soar up into the sublime heights of poetic thought as he dwelt upon their manifest agency in the affairs of na-Surely 100 colonies would just thre? Surely 100 colonies would just "set him up," because, according to John Allen, they ought to yield at least 500 lbs, per colony, and certainly after friend Hasty got his improved clover into operation, one could double that yield. Good Mrs. Hopeful mildly suggested that, though it certainly looked producing should be produced to the constraints of the constraints. with upward ventilation the bees make the circulation. Just so: where there is left; so conce knew a man who is life there is heat; hot air is light, and in the top, while the cold outside air is heavier, and flows in to supply the

informed Mrs. H. upon the subject of the off horse, and a sudden muscular bee-culture.

As in deep fervency of spirit he proceeded to enlarge upon the mysteries of scientific apiculture, dear little Mrs. Hopeful's heart also began to expand towards him, and she was heard to exclaim in an undertone, "La me, how much he does know." Yes, hee-keeping, he reasoned, was certainly his special province, for who ever heard of an individual that could "talk bees," that wasn't bound to succeed with that wasn't bound to succeed with them? True, says he, Doolittle and others have uttered cautions and ad-vised beginners to "make haste slowly." but of course they are only croaking.
"Give me the bees and I'll show em." "Give me the bees and I'll show 'em." As good lack (?) would have it, along came Tom Cheat that evening, and hearing that Mr. Hopeful had a violent attack of the bee-fever, slipped in to see him (you see friend Hopeful had fairly made his neighbor's ears buzz by his incessant talk about bees). Tom had about 40 "gums" (how contemptuously Hopeful smiled in his sleeve on hearing that hast word) and would sell them at the low price of \$6.50 each, just because he hadn't the time to spare to "tend" 'em." Furthermore, he heard Bill Slambanger remark that his (Tom's "tend" 'em." Furthermore, he heard Bill Slambanger remark that his (Tom's) bees were the "rale Itland bees." That last remark was a clincher for Hopeful; has remark was a clinener for toperin; he closed the bargain on Tom's terms, then and there. Surely being Italian bees they were a bargain. What if it did finally compel him to sell his best cow to replace this outlay? Italian bees wern't to be bought every day and bees wern't to be bought every day and money wasn't an object in comparison. Tom, being severely troubled with corns, it would, he said, greatly oblige him if neighbor Hopeful would come himself and remove the bees. Hopeful readily assenting. Tom smiled as heathen Chinese are supposed to, and jingling his cash, was off.

It was on a salubrious spring morning, not many hours after this, that our ring, not many nows after this, that our esteemed friend went after his purchase. He hitched up to the old springless farm wagon, of course, as it would hold the most. Son John accompanied him; he was anxious to get his "pets" home before they "thawed out," for it didn't require "book larning" to teach him that bees "froze up" during the him that bees "froze up" during the cool months the same as bears, etc. Arriving at Tom's he bethought himself to look at the little beauties, and be assured, to use his words, "that they were still torpidized." Sure enough, as he boldly peeped under several stands, there they were, so quiet, and still, and stiff. Why he could (he declared to John) put his hand right up beside them and not so much as feel them stirnnless it was to drop to the bottomthem and not so much as feel them stir, unless it was to drop to the bottomboard. He was delighted; he looked at still another. This was somewhat heavier. He enjoyed to fondle these "darlings," but so suddenly and very energetically he withdrew his hand, snapped his fingers, and John asserts down to this day that he uttered an exchanation that sounded very much like "golly"—anyway, he quickly remarked that he gussed he wouldn't except his properties. examine any more. Tom suggested putting an old bag over some of those that he was afraid had been awakened that he was afraid had been awakened by wood chopping in the next yard. This was very thoughtful of Tom. So they loaded them up—the whole 40—thanks to Tom's ingenuity, and drove off. John was assigned the driver's seat, while the proudfather rode astride the load to direct the movements of the precious freight. All went smoothly as need be for the first mile, though John remarked that he thought the old mill dam must have given way again as he heard such a roaring near by. is he heard such a roaring near They did not investigate, however, un til friend Hopeful ordered a halt, as he fill friend Robertal ordered a hart, as he said, "to pick out the slivers" from his nether limbs. A search revealed the fact that the so-called "gums" were yery rough on the exterior, and some of Mr. Hopeful's bees seemed intent upon examining said roughness, as they rushed excitedly up and down the same. But such tritles failed to disturb Mr.

the off horse, and a sudden muscular raising of the hinder limb, which resulted in the entire destruction of one of the "gum heads" as the lively animal's hoof dashed into it. Both horses now became remarkably animated. John had no opportunity to investigate, but he was morally certain that he was sitting upon a very rough and much splintered piece of bee-turniture, and that it felt very hot to him. At this juncture the neighbors all say our friend Hopeful was frantically waving his bandanna handkerchief around his head. It was certain, as the horses rusined frantically into the yard, he was ejaculating something like "not so rusned frantically into the yard, he was ejaculating something like "not so very torpordised, after all," "worse than hybrids," "get the hartshorn," and other like significant expressions. A future number will perhaps portray Mr. Hopeful's future progress in beeculture culture.

For the American Bee Journal.

#### Mi Lamentid Ded.

B. HIX.

It iz ezy tu report disastur, when it don't kum klose to hum. i kan talk purty freely abowt mi nabur's losses, but when litenin striks me i aint quite sow volubel. Mi bea report wood hev hin spred befoar the reders ov the Journ-NAL long agow, Butt i wanted 2 git over mi solemnity a little, and alsow 2 sea if mi losses went above a hundred pur cent., which it haint, thanks 2a warm spel. The first weak in March found me steppin' hi, and i wuz pre-pairin' an artickle fur the press, on "How 2 winter beas sucksesfully," Butt there waz a hitch in the tune, and it haz gone into the waist baskit or obit haz gone into the waist baskit or oblivion, along with mi aspirations and mi prospective humny krop. Marck 20, 1881, waz a sad da fur me, the wether waz warm and old "sol" shone mockingly down. A kold snap had intervened and i wuz onezy, fur the beas dident seam 2 take in the situation. Now and then a Backteary laden bea wood fly athwart the yard with a doleful dissentary hum that lingerd in mi ears like a funerial nell.

I notist a slight depreshion in mi feelins az i approached and lifted the kuver

I notist a slight depreshion in mi feelins az i approached and lifted the kuver ov no. 1—ded, chaff, cos, starvation. No. 2, i lift the kuver tremusly, ded, gone to the land ov shadders packed in chaff. No. 3, ded, 2 much hunney jest out of reach fur a kold snap, snaped their thread of life. No. 4, hibrids, chaff, kombs the most fowlest ever seen, Butt not ded (ded enuff 2 da), i fix em, and proseed 2 No. 5, pure itallions and ded, the sweat starts. No. 6 to No. 42, awl ded butt won and that purty week. I think of Muther Shipton's prophesy relating to the end of the world, and reflect that purhaps the awful fiatt or annihilation hez comawful fiatt or annihilation hez commenced in earnest. "And the evenin' and the mornin' waz the first da," March 21. If i rember kerect, i dident sleep a very good slumber the nite be-foar. How kan i keep this thing from my nabors? shal i keep mmm, or face the music like a man? waz the thots that drove mi sleep awa, 10 o'clock, a. m. With sett teeth and the aggony ov ni. With sett teeth and the aggony ov hopelessness pictered onto my face, i litt the kover of No. 43, a large swellin' under the quilt rivets my attention—it sturs, and presently 5 deer mice, slick and fatt, skampur awa; a hole at one end reveals their base ov supplies. No kloggin' in this hive, bottum-board clean, beas in fine kondition, sum hunney and a little bonde. What a pity i clean, beas in fine kondition, sum hun-ney and a little bride. What a pity i dident have mice enuff 2 gow round. The mice served a dubble purpose; they kept the bees dry and free from kloggin', also both beas and mice as-sisted in keepin' up the temperature. Az i sloly butt fully komprehendid the astoundin revalation that perhaps a fatt wood-chuck in a torpid state, klose to the brude-nest, seperated by a skreen division-board, waz the kee tu unlock the dark mistery ov winterin' beas, I waz overkum with joy. Sixty

the bizzy hum ov industry, i saw the price of wood-chucks advancin' and wood-chuck farmin' on a grand skale waz fully developed, and the winterin' waz runy developed, and the winderin ov bees waz no more a question than the winterin of a mule. I wanto gow onto the record az the furst man 2 utelize this quadruped by the klover field. I have nun 2 sel and the plan wont be pattented. Deer reder, mi report iz bepattented. Deer reder, mi report iz l foar you and i hope you air satisfide.

Read before the S. W. Wisconsin Convention.

#### Bee-Keeping-Will it Pay?

NEWELL FRANCE.

The idea many people have, that bees will take care of themselves, and bring the apiarist large returns for little or no labor is incorrect and a drawback to bee-keeping, as well as inducing many to engage in the work who are not adapted to it, either in natural taste or love for it, capital to work with, or a sufficient knowledge to insure success.

Ignorance of bee-culture is one, if not the greatest cause of failures. Thor-ough knowledge of the business is necessary, as well as practical application

and hard work.

Much information can be obtained by reading bee-papers and books, but act-ual practice in the apiary is just as nec-essary; in fact the successful bee-keeper must have both. He must always be willing and anxious to learn something for improvement, and if he is so, will find plenty in advance for him.

In successful bee-keeping more depends upon the bee-keeper than on the pends upon the bee-keeper than on the kind of hive, bees, or even location, although these are important. He must have enough interest to know every month the exact condition of each colony, their wants, and how to supply them at the proper time. I know not of any other out-door work that depends so much on the right thing being pends so much on the right thing being done and at the right time. pecially noticeable in the spring or harvest season, which, in this latitude, is so short, that a mistake then made may cause great failure.

He must be observing at all times; for instance, in the spring or tall, when there is nothing for the bees to gather, he hears a bee fly by with that peculiar hum of robbing—he must immediately find the cause, for if left a day or two he may find some colonies robbed of their stores, and perhaps those bees have become discouraged and left.

I have found, by experience, that activity is very important. The apiarist must move around quick, always being careful. Some people can move quick enough, but in so doing are careless. hitting things near by them, etc. This will not do, for often a jar or careless

motion causes serious work.

In obtaining hired help I have found that boys 15 to 18 years old will be as careful and very much quicker than grown persons, besides, they do not demand as high wages. Some may not see the use of being so careful. I will illustrate: I have a frame with a new comb in it, full of honey, to extract; I am a little careless and jar the comb in their it care. taking it out of the hive, or in sweeping bees off, or 1 may hold the comb a little sideways—the result is the comb is broken and of no more use, and per-haps the honey lost also. Examples of this kind very easily occur at all seasons. At some of our conventions we have been asked if we thought such have been asked if we thought such and such a person would succeed in beeculture. That, of course, neither we nor anyone else knows until they have 
tried; but if they have poor eyesight, 
or are much of a cripple, I would not 
advise them to attempt it. It takes a 
keen and quick eye as well as good use 
of hands and feet. I am not of the 
continue (which I have seen advanced) opinion (which I have seen advanced) that a person of too poor health to other kinds of labor can retire to the so-called easy work—bee-keeping—and make it a success. True, bees are interesting to study, and the Italians are interesting to study, and the Italians are interesting to study.

silent and 'grim, agin teamin' with beautiful in color, and will give pleasure, even to an invalid, but I much question the prospect of success for such to make it a specialty. With such a winter as we have just had, many beekeepers of little or much experience are disappointed, and some are discouraged, determined to hereafter buy what honey they want, as it it is cheaper for them they with as it is cheaper for them than to bother with bees all summer, and when winter comes have such losses. I admit it does look discouraging, but he that succeeds must not get discouraged if he does have some losses. See the farmer—does he quit farming because some year his crops fail, or his stock becomes diseased? No. The goes right down to the scientific analysis of the cause; finds it, and how to hereafter prevent the same failure, and, in the long run, is benefitted by

and, if the long full, is benefited by having had the failure.

So it is with the successful beekeeper. If a trying winter comes, he will, if he succeeds, do all in his power to prevent any cause of failure before experienced. He must not be easily discouraged; ever determined, success shall be his portion. Generally, one extreme follows another. We have had a tew years of easy work to succeed, but this last year has brought us the other extreme; why not look for its reother extreme; why not look for its re-action in the year approaching? All bee-keepers, however, do not keep bees to obtain their profit from the honey produced. Many keep bees to rear queens and colonies to sell. This part of bee-keeping is getting to be quite extensive, and I think many realdure extensive, and I think many tear-ize a far greater profit this way than they would by producing honey. Thus they would by producing honey. Thus our papers have many articles on Italians, claiming their superiority without practically testing, when, I think, the writer's object is to advertise himself as

an Italian breeder.

The Italian bee was first imported into America in September, 1859, and ever since importation and home-breed ing of queens has been constantly gaining, until at present the supply rather exceeds the demand, and importers are opening a new field by in-troducing other races of bees. Bees can, and have been greatly improved, but I think much is said when the object is to help to sell queens. My only objection is, it induces the beginner to place too much confidence on the supply

itealer's advice.

oth the honey producer and supply dealer are needed, and can make it a success, if prepared and determined so to do. How many kinds of occupation are there that people engage in and are successful, without first having served some time with some one of practice? The blacksmith, wagon-maker, miller, carpenter, editor, etc., had to serve considerable time in practice or prepara-ration before he was considered capa-ble of doing business for himself. Why, I ask you, is the bee business an exception? Should not the keeper of bees be schooled and given practice, just as much as the learner of any other trade? Too many are trying to the many kinds of business at once, to ever many kinds of business at once, to ever make it pay. If he is to be an apiarist, he must not let other business interfere when the bees demand attention. Again, if you keep bees can you af-ford to take a paper or not? Yes; most

torn to take a paper or not? Tes, most certainly, if you have bees enough to have honey to sell. The best bee-papers are, the BEE JOURNAL Gleanings, the Exchange, etc. The best books are, the "A B C of Bee-Culture," for beginners, and Cook's "Manual," for the most advanced and sejantific more advanced and scientific.

Read before the S. W. Wisconsin Convention.

#### Wintering Bees in a Pit.

REESE POWELL.

A dry pit is very well adapted for wintering bees, even though it be not wholly secure from frost; the temperature will be much milder and more uniform than in the open air or cellar; bees will be more secure from disturbance and will be protected from the piercing cold winds, which cause more injury than the greatest degree of cold, where the air is calm.

Universal experience teaches us that

tions of temperature, the better will they pass the winter, the less stores will they consume, and the more vigorous and numerous will they be in the spring.

The pit may be made 1 feet wide, 4 feet deep, and the length to depend on the number of colonies to be put in; the sides and top should be boarded, to prevent the loose dirt from falling in. about 6 inches of straw or should be spread on the top to absorb the moisture (before banking lock the dirt), and 2 pipes on each end, 1x6, in side measure, to give them ventilation.

If either bees or stores are lacking they should be supplied during warm weather, so that all may be quiet and bees or stores

ready for the winter long enough be-fore it becomes steadily cold. All the hives should be examined about Sep. 1, and if they have not enough bees, double them; extract all the unsealed honey, leaving about 25 lbs, of sealed honey for winter, and if most of this is gathered in June, so much the better. Last year I took 4 combs of basswood honey, containing 25 lbs. in all, and gave it back for them to winter on, and took away all the late fall honey, and they wintered splen-didly, and are now the best colonies I have; they seem to be as strong now as

Read before the N. E. Convention.

#### Requisites for Wintering Bees.

H. H. FLICK.

To a reader of our bee publications it is plain that there are many bee-keepers or persons who keep bees in summer not in winter; many others have doubtful or ill success in wintering.

I made my system of winter management public in 1873, through the Busy Bee, and have since written various es says for our conventions, upon the same subject: but in bee-culture, as in everything else, we need "precept upon says for hence my excuse for again writing upon this threadbare subject.

A theory is known to be correct, when, being put in practice, it proves true. My system is based upon cor mon sense and well known facts; is e based upon comceedingly simple and easily understood. It was proven successful for 7 succes sive winters, not having lost a single colony by this management, while colomes in the same apiary, and others in this vicinity, not cared for as described

hereafter, have perished.
Preparations for successful wintering commence in spring, as soon as oney season opens. All colonies the honey season opens. All colonies must be kept strong. A good bee-keeper will not permit his bees to be reduced in numbers, either by natural or artificial swarming; neither will be ex-tract honey from the brood apartment. This is a vital point. Early honey stored by the bees in the brood chamber is always good, and if the bees are properly managed, enough good honey will be placed in the brood frames for the bees to subsist on during the severest weather. Many bee-keepers make a mistake right here, by extracting all the good honey, and expect the bees to live on fall-gathered sweets. I never extract from the brood chamber, but keep good vigorous queens, and abundant surplus room, and I never find the queen crowded with honey, neither have I a complaint about late breeding. Frost usually kills all honey-producing flora during the latter part of September, and our bees never breed in October, yet they always winter and spring safely.

We are situated in 40° north latitude; elevation above the tide water, 2,200 feet. We are located in the valley between the Allegheny and Laurel Ridge mountains, and our winters and springs are pretty long and severe, on account

of our high latitude.

If there are any weak colonies in the fall, they must be united, and if any are short of stores, they must be provided for by giving combs from those colonies that have too much. No colony should go into winter quarters with less than 30 pounds of good honey; more will do no harm, and it must be in as compact a form as possible. have the stores for winter spread over s or 10 combs will never do, as the cluster of bees cannot change combs in

The size and shape of the frame has much to do with successful wintering; the frame I use is 13x19 inches outside the frame I use is 15x19 inches outside dimensions. By using this sized frame the bees have the sealed honey above, and rearward of the cluster, the warmest part of the hive. As the honey in the forepart of the combs is consumed, the cluster gradually masses based.

the cluster gradually moves back.

During the breeding season we use

of these frames. In the fall we contract to 5 or 6. These are placed in the r of these frames. In the ran we con-react to 5 or 6. These are placed in the centre of the stand; across the top bars I lay 3 or 4 sticks 3, in, square, and cover with a good woolen quilt. These cover with a good wooled quit. These sticks permit the bees to pass over the top bars from one comb to another. I also have passage holes 3 or 4 inches below the top bars in the combs, thus giving access to all parts of the hive

By placing the combs in the middle of the outer case, or house, an empty space is left on all sides between the brood chamber and onter case. This is filled with chaff or finely cut straw. The space above the quilt is also covered with the same material, to a depth of 17 inches. This keeps the bees warm by retaining the animal heat, guarding against sudden changes of temperature, and insensibly carrying off the vapor, exhaled by the bees. Under the roof exhaled by the bees. Under the roof at each end, I have ventilators to perat each end, I have ventuators to permit free circulation of air above the chaff to prevent moisture from collecting in the packing. Bees packed in this way need very little ventulation. In the winter of 1878-9, about ½ of our bee-houses were entirely covered

with snow for 2 or 3 weeks, the winter being a severe one, but no ill effects tollowed; swarming commenced as early as the 5th of May.

I close the entrance to about 12 inch, and the portico slides brought together within about <sup>1</sup>4 inch—the entrances not matching—one being set at the right side of the portico, and the other at the left, thus preventing cold draughts of air or snow from entering direct. This also makes it impossible for mice to enter. Whatever hive may be used, care must be exercised to exclude mice; entranee must be well guarded

against these depredators.

During the winter, on mild days, when bees fly, the entrance can be enlarged, and the bees may be assisted in arged, and the bees may be assisted in removing dead bees and litter, when long confined; this, however, is not necessary, only a help. For this pur-pose a long handled scraper, made from heavy wire, should be used. The re-fuse of the hive should be scraped into a receptacle, and carried away from the apiary. The manure heap is the best place for such filth. At other times the bees should not be disturbed, but let severely alone. The packing may remain until warm weather, according to locality, when it must be taken out clean, the colony inspected, and put in shape for its summer labors.

There are 7 fundamental principles:

1. We must have all colonies strong; 2. each must have a fertile queen; 3. plenty of good food easy of access; 4. never extract honey from brood frames; 5. a frame of the proper size and shape; 6. passage way across and through combs; ample protection against the sudden changes of temperature, whilst properly ventilated so as to insensibly carry off the moisture exhaled by the bees.

The advantages of this system are:

1. There is no trouble in carrying heavy hives to and from the cellar.

2. Bees can tly any time during the winter when the weather will permit.
3. During cold weather in spring, packed hives are warm, and bees breed much more rapidly than in any other

way.

4. The preparing and packing for winter can be done during early fall at leisure times, and when packed they need no more attention till spring except to enlarge the entrances once or twice during mild weather.

We find no moldy combs or dis-

ased bees.

6. Bees wintered in this way in pure air are strong and vigorous, breed up early, and "spring dwindling" is un-

There is satisfaction in knowing that your bees are comfortable, and by safely wintering all your colonies you find them strong when the honey season opens.

Lavansville, Pa.

#### THOMAS C. NEWMAN.

EDITOR AND PROPRIETOR,

CHICAGO, ILL., JUNE 22, 1881.

#### Special Notice.

The next number of the Weekly BEE JOURNAL completes the first six months of its existence. We are more than pleased with the manner in which it has been received, and the welcome that has been accorded to it everywhere.

Several thousands have only subscribed for six months, and their subscriptions expire with the next number. To all such we wish to make a few remarks:

By sending on their renewal at once. they will not only prevent the annoyance, to themselves, of missing the regular visits of their old friend-the Weekly BEE JOURNAL, but they will save us much trouble in taking their names off from our mailing lists, and then re-entering them within a short time. We hope all will renew at once or else send us a notice, by return mail, if they desire its visits continued.

Once in a while we receive a rather uncourteous letter because the Bee JOURNAL is discontinued when the time is out that has been paid for. We try to please all our subscribers, but it is not an easy task for us to determine who does and who does not want it so continued; so we must ask to be informed on the subject.

The following is just such a notice as we wish all would send who desire to have it continued without intermission. Then we put this mark, "||Jun 81," after the name on the wrapper label, and when so marked we do not stop sending the Journal until we receive an order from the subscriber to do so.

" Please continue my Journal right along; if I do not send the money on the day it runs out I do not want you to stop it, for I want every number as soon as it is published. I will send you the money just as soon as I can make it convenient to go to the post office to get a money order.

Now, if all who desire it so continued would drop us a postal card, or mention it when they are sending a remittance, it would save us much trouble and themselves the annoyance of having the Journal stopped.

Too Much Drone Comb. - Mr. R. P. Williams, of Goldsmith, Ind., asks the following questions:

- 1. How much drone comb should be left in the hive?
  2. Will all eggs laid in drone comb hatch drones?
- I have some very nice combs which contain all drone cells; how can f keep the drone brood out of it, or shall I cut
- 4. How many queen cells ought to be left after dividing, in the colony that
- has no queen?
  5. Is it the fault of the queen, or the bees, that there is too much drone comb? Do the bees make the comb, whether she is a drone-laying queen or not?
- 1. As little as possible, if you are running for surplus honey.
- 2. Yes.

supply its place with good worker foundation.

- 4. It matters not how many; the first queen emerging from a cell will look after the remainder.
- 5. At the time of honey-gathering, if obliged to build new combs at the outside of the brood-nest, the bees quite frequently construct it with drone cells. This is one of the forcible arguments in favor of the use of comb foundation. Of course, when bees are determined to have drone cells, they will build them, even though they have to cut away worker cells to get room to do so; but, as a rule, drone comb can be almost entirely excluded from the hive, by using good worker foundation, to be given no faster than they can work it out. If it is desirable that the queen occupy it, place it alternately in the centre of the brood-nest; if desired for honey-storing, then place at the sides of the brood-nest next the hive.

#### Law against Adulteration in Illinois.

The Legislature, just before adjourning, passed the following law against adulteration in Illinois. We hope it will not be allowed to stand, "a dead letter on the Statute Books of the State." It should be strictly enforced:

The law provides that no person shall mix, color, stain, or powder, or order or permit any person in his or her em-ploy to mix, color, stain, or powder any article of food with an ingredient or material, so as to render the article injurious to health or depreciate the value jurious to health or depreciate the value thereof, with intent that the same may be sold; and no person shall sell or offer for sale any such article so mixed, colored, stained, or powdered; that no person shall, except for the purpose of compounding in the necessary preparation of medicine, mix, color, stain, or powder, or order or permit any other person to mix, color, stain, or powder any drug or medicine with any ingredient or material so as to affect injurient. any drug or medicine with any ingredient or material so as to affect injuriously the quality or potency of such drug or medicine, with intent to sell the same, or shall sell or offer for sale any such drug or medicine so mixed, colored, stained, or powdered; that no person shall mix, color, stain, or powder any article of food, drink, or medicine or any article which enters into cine, or any article which enters into the composition of food, drink, or medicine, with any other ingredient or ma-terial, whether injurious to health or not, for the purpose of gain or prolit, or sell or offer the same for sale, or order or permit any other person to sell or of-fer for sale any article so mixed, colored, stained, or powdered, unless the same be so manufactured, used, or sold or offered for sale under its true and appropriate name, and notice that the is mixed or impure is marked. printed, or stamped upon each package roll, parcel, or vessel containing the same, so as to be and remain at all times readily visible, or unless the per-son purchasing the same is fully in-formed by the seller, of the true name and ingredients (if other than such are known by the common name thereof) of such article of food, drink, or medicine, at the time of making sale thereof or offering to sell the same; that no person shall mix oleomargarine, suine, butson snar mix oleonargarine, sume, but-terine, beef fat, lard, or any other for-eign substance, with any butter or cheese intended for human food, with-out distinctly stamping, marking, or labeling the article or package containing the same with the true and appropriate name of such article, and the percentage in which such oleomargarine or sume enters into its composition; nor shall any person sell, or offer for sale, or order or permit to be offered for sale, any such article of food into the composition of which eleomar-

hive—one at each outer side of the brood chamber; better, however, cut it up and put it in the surplus boxes, and supply its place with good worker foun. tion:

rovided, That nothing in the act shall be so construed as to prevent the use of harmless coloring matter in butter and cheese or other articles of food; that any person convicted of violating any provision of any of the foregoing sections of this act shall, for the first offense, be fined not less than \$25 nor more than \$200; for the second offense he shall be fined not less than \$100 nor more than \$200, or confined in the county jail not less than one month nor more than 6 months, or both, at the discretion of the court; and for the third and all subsequent offenses he shall be fined not less than \$500 nor more than s2,000, and impisoned in the peniten-tiary not less than one year or more than 5 years; no person shall be con-yicted under the foregoing sections of this act if he shows to the satisfaction of the court or jury that he did not know that he was violating any of the pro-visions of this act, and that he could not, with reasonable diligence, have obtained that knowledge; the State attorneys of this State are charged with the enforcement of this act, and it is hereby made their duty to appear for the people and to attend to the prosecution of all complaints under this act, in their respective counties, in all courts.

#### Methods of Using Foundation.

We frequently receive inquiries similar to the following, from parties who have been more or less annoyed with foundation breaking down, etc.:

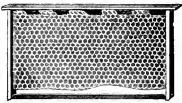

I am perplexed—almost out of humor. fastened the foundation on to the frames, as I supposed, according to law pressing down with a putty-knife), but it does not stay. As I opened the hive of a swarm two days old, the other night, I found three sheets of foundation lying on the bottom of the hive. I was vexed; resolved to go to headquarters for in-ormation. Now, will you please give a the next issue of the BEE JOURNAL formation. full directions for fastening foundation on the frames? Give full directions for handling foundation. Is it best to fill handling toundation. As to see the frames full, or will starters two or three inches wide serve to keep the combs straight? Nothing is more procombs straight? Nothing is more provoking than crooked combs in a colony of bees. I wintered in the cellar, had good luck, and bees are doing nicely now, with plenty of clover and rain. I examined a swarm one week old Saturday, that was nearly full of nice comb, honey and brood; will put on surplus sections this week.

Galva, Ill., June 13, 1881.

We can only answer the above questions by giving our way of using it, and referring to some of the methods practieed by others, but will recommend no particular plan for fastening it, for the reason that practice and painstaking has much to do with acquiring facility and perfection in anything pertaining to the internal economy of the hive, and we do not wish to provoke any discussion with those who have derived satisfaction from a plan differing wholly or in part from ours.

We use Langstroth frames with a V-shaped top-bar; the foundation is just as wide as the inside of the frame from the bottom-bar to the lower point of the top-bar, and is one inch shorter than the frame from end to end. When ready to use a set of frames, the foundation is placed on clean paper, evenly piled, with the straightest edge next the operator: now with a sharp knife make four incisions or cuts half an inch long down through the foundation to the paper, and at equal distances from each placed at each end of the pile, turn up 3. Do not, under any circumstances, garine or suine has entered, without at leave more than two drone combs in a leave more than two drones are the combs and leave more than two drones are the combs and leave more than two drones are the combs and leave more than two drones are the combs and leave more than two drones are the combs and leave more than two drones are the combs are the combs are the combs and leave more than two drones are the combs are the two end-cuts with the thumbs, and full explanation concerning the failure.

lay the sheet down with the top edge nearest you, place the frame with the lower or sharp edge fitting closely to the joints formed by alternately bending up and down the flaps, and press the foundation to the top-bar with the thumbs, drawing to you. When warm and the wax quite pliable, the work is very speedily and effectively performed -scarcely requiring more than ten minutes for a full set of frames. The foundation will reach within half an inch of each end-bar and the bottom-bar, and give ample room for the bees to pass from side to side. Of course, a greater number of cuts will do no harm except to take up more time. With good foundation we have never had any breaking down, warping, nor sagging to any appreciable extent. The engraving will give a comprehensive idea of the appearance of a sheet of foundation ready for the hive.

Many bee-keepers use a top-bar with a tongue or in-set projecting below its surface, to which they fasten the foundation by pressing with a putty-knife. Others lay the edge of the foundation along the tongue, and fasten by tacking a thin strip of wood over it. Melted beeswax and rosin is used a great deal, with which the foundation is sealed to the top-bar. Split top-bars are used by many, and possess some advantages over most other kinds. These, however, necessitate considerable labor, as the nailing down of the top-bars cannot be completed till after the insertion of the foundation.

Starters two or three inches long will not always insure straight combs, but, of course, are much better than empty frames; but with a good article, full sheets are much more satisfactory.

In hiving swarms, if very strong, we would throw them on full sheets and a full complement, to prevent concentrating too much weight on a few; but if building up, then give full sheets, in the centre of the brood-nest, only as fast as they can use it.

On page 2 of the first number of the Weekly BEE JOURNAL, "M. B." had an article on "Fertilization in Confinement," and promised a full description of the cage used, etc., during the present year. Mr. Louis Hofstatter has waited patiently, but says he has now become very anxious to hear from the experiment, and asks us to call on " M. в., to "rise and explain." He must remember, however, that so far we have had but little suitable weather for such experiments, and must wait with patience, and give time sufficient to make several experiments, for such only will be of any value to the science and art of bee-keeping. Slip-shod experiments and hasty conclusions are always deceptive and undesirable. Let all wait until the experiments are comother and the ends; with the hands pleted, and then, doubtless, all will receive the coveted information, or else a

LONDON JOURNAL OF HORT.

Capturing Bees that were lodged in Stone Walls.-Mr. Frank R. Cheshire gives the following incidents, showing how colonies in inconvenient places may be dislodged and made to enrich the apiaries of their captors:

The double wall formed part of an the double wan formed part of an old structure, and through the aperture, the result of decay, the swarm had evidently entered, and had utilized, as we afterwards found, an interspace only 4½ inches wide from front to back. A bricklayer was employed to cut out the front bricks, to lay the colony open to view, and this work acted like the hivebeating in driving, completely quieting the bees, which made no resistance to the removal of their comb. The brickthe removal of their comb. The brick-layer was not a bee-keeper, and so it soon became expedient to remove the bricks myself, litting out the honeycombs as it was possible to free them. These I found about 3 feet 6 inches deep, and supported at intervals by cross bricks, but unfortunately, as we came upon the brood-combs, the queen retreated, with the greater number of bees, into the recess beyond reach. All the brood combs he withing trimping the brood-combs, by cutting, trimming, and fixing into frames, were made ready for the hive, but the inhabitants, except the very young, flew from them and returned to the wall. The queen was not with us, while nearly all the bees were with her, and quite inaccessible, unless so much of the wall was to be removed as to endanger its safety. In the dilemma we fixed the frames with their brood-combs as nearly as possible in true position, and in the spot the brood had previously occupied, nailing up over all a large gardener's mat.

So soon as quietude was restored, the bees, with their queen, returned to feed and warm their young. The next morn-ing the mat was lifted with as little disturbance as possible. The insects were discovered closely clustered, putting their plundered house in order. The hive to receive them stood against the wall just under their old entrance. Frame after frame was lifted down, the queen, in due course, making her descent with the rest. The few bees that scent with the rest. The few bees that took wing soon learned the position of their comrades, and the colony was established in its new quarters with but very little loss, and yielded its owner a fine super at the close of the summer. The main point of interest rests in the manner of capturing the queen by restoring for a time the combs, to which she will infallibly return, when their second movement is too rapidly and quietly accomplished to give her a chance of cluding us. their comrades, and the colony was eschance of eluding us.

But to our second case. The 3 or 4 colonies in the roof of Much Hadam Church, the descendants doubtless of one, had behaved so badly that further forbearance was impossible. A swarm was sent out on the morning of a confirmation, and audaciously entering the church window, clustered on the ornament not far from the pulpit, and one reckless bee from this cluster commitreckless bee from this cluster commit-ted the sad indiscretion of stinging a bishop. This sealed their doom, and not long after ladders were raised, and your humble servant was peering down between the slates, as the saucy insects were traveling in and out through 4 or 5 openings. The master builder in at-tendance came to give directions, but a great of wind, common to such altitudes gust of wind, common to such altitudes, nearly carried away his hat. His rapid movements in preventing this catastrophe produced a worse, for 5 or 6 bees, which regarded this quickness as a menace, took aim at his uncovered

pedient previously explained. While the queen and retinue were returning to their old quarters, so as to make their final dislodgement easy, the exthen than dislogement easy, the extractor was set to work upon the comb honey, and soon 60 lbs. of splendid honey was freed from wax and pollen. After the final removal of the bees the following morning, the hollow in which this colony had existed for several years was, by my order, filled with coke previously saturated in carbolic acid. This last substance emits an odor so disgusting to the genus Apis, that no fresh swarm is likely to choose this spot as a dwelling place.

#### MISCELLANEOUS.

Comb Foundation for Surplus Honey. -Mr. Dougherty, in the Indiana Favmer, remarks as follows:

The merits and demerits of the use of foundation for surplus honey has been under discussion since its first introduction, and although at first there was good grounds against its use, with the improvements of the last few years. it has become a success, and with one or two exceptions, is used extensively by most of our practical bee-keepers. We have experimented extensively in its use, and do not hesitate to recommend it for use in the surplus boxes, not alone a strip in the top of the section as a starter, but that the sections be filled quite full, giving the bees a good start, insuring straight combs, and in much better shape than where the bees are allowed to build the comb at

A French paper relates that at a village near Florenville (Luxembourg) a gentleman, walking along beside a wood, saw some bees swarming on a straggling branch of an oak tree. He went to fetch a hive, and returned, with a wood-cutter named Guiot, who climbed the tree, and sitting astride of the branch, cut off the extremity of it upon which the swarm hung. An un-expected result followed: instead of falling to the ground, the swarm disraining to the ground, the swarm dispersed, and, raising like a whirlwind, settled on the head of the unlucky Guiot, who was still sitting on the branch, 45 feet from the ground. The bystanders shuddered. Surely, they thought, he will be seized with giddiness, and tortured by a thousand stings, he must fall to the ground. But Guiot. he must fall to the ground. But Guiot called up all his strength of mind, and remained until the swarm had formed 2 long wreathes hanging from his temples, and waving as he moved; then half blinded by the insects, which also covered his face and body, he contrived to descend from his elevated position, taking the greatest care not to irritate this living mantle. When he arrived on terra firma a hive was placed on his shoulder, but 3 hours elapsed before the bees would take possession of their new When this happy change was effected the poor wood-cutter's wild de-light testified to the intensity of the anxiety and discomfort he had endured.

The Season in England.—The editor of the British Bee Journal remarks as follows on the honey season in England:

If the past month of May has not been all that could be desired, it has, on the whole, been a charming one and a vast improvement on many in preceding years. The usual "break" oc-curred in the middle of it, but did not continue as long as former experiences led us to expect, and, excepting that the nights have been cold, the bees the nights have been cold, the bees have been doing well. Swarming is late, which perhaps may be accounted for by the excessive labor of the bees in honey gathering, many of our hives being less populous in the third than in being less populous in the third than in the first week, a glut trom the orchards being available before they had made sufficient headway in the brood-nest, and the loss of life by overwork great menace, took aim at his incovered scalp and caused him to retire discomfitted. A practical breach was soon made, and then pailful after pailful of honey-comb, which at length fairly filled a large saucer bath, was the first instalment of the booty. The broodsmitted and had to be gained by the expectation of the combined and had to be gained by the expectation of the combined and had to be gained by the expectation of the combined and had to be gained by the expectation of the combined and had to be gained by the expectation of the combined and had to be gained by the expectation of the combined and had to be gained by the expectation of the combined and had to be gained by the expectation of the combined and had to be gained by the expectation of the combined and had to be gained by the expectation of the combined and had to be gained by the expectation of the combined and had to be gained by the expectation of the combined and had to be gained by the expectation of the combined and had to be gained by the expectation of the combined and had to be gained by the expectation of the combined and had to be gained by the expectation of the combined and had the loss of life by overwork great in proportion. In gardens where no bees are kept there is the usual combined and the first plant that the early fruits are dropping off, and the frosty nights and blight are being available before they had not be provided and the loss of life by overwork great in proportion. In gardens where no bees are kept there is the usual combined and the loss of life by overwork great in proportion. In gardens where no bees are kept there is the usual combined and the loss of life by overwork great in proportion. In gardens where no bees are kept there is the usual combined and the loss of life by overwork great in proportion. In gardens where no bees are kept there is the usual combined and the loss of life by overwork great in proportion. In gardens where no bees are kept there is the usual combined and the loss of life by overwork great

While others are described as "shy," Our turning gooseberries hang "like ropes of on-make jons," the blossoms having had ample fertilization—a fact well worthy of careful attention by those who grow fruit for profit.

> Bee-Keeping in Texas. — The Land Register, Boerne, Texas, remarks as follows:

> Bee-keeping, from a very small beginning, is receiving considerable at-tention in Kendall county. That the business is a profitable one all agree who have given it attention. The rewho have given it attention. The re-turns are very large in proportion to the outlay of capital and time; the seasons and wild profusion of honey plants are all that is necessary to insure success to those bee-keepers who are pre-pared by needful industry and intelligence to make the most of the busi-As an illustration of what can ness. be done with bees in this country, Mr. Moore, of Llano county, took in one season, from one hive, 230 lbs. of honey, which, at 20 cents per lb., would net \$46 on an investment of less than \$5.

> Extracted vs. Comb Honey .- As to which kind is the most profitable to produce, Mr. Dougherty, in the Indiana Farmer, remarks as follows, and at the same time indorses the views of the BEE JOURNAL. He says:

> As to which kind will pay the best depends upon how it is to be sold, wholesale or retail, distance to market, etc. You can produce 1/3 more, good well ripened extracted, than you can of comb ripened extracted, than you can of comb honey, and when you have a good home market, at retail, extracted honey will bring within a few cents as much per pound as comb honey. Where honey bring within a few cents as much per pound as comb honey. Where honey has to be shipped long distances, ex-tracted honey will undoubtedly pay the best. The freight is cheaper. The loss from breakage and leakage is much less. Extracted honey is growing in favor rapidly, and in the near future comb honey will be in little demand. In creating a home demand it is well to In creating a home demand it is well to produce both kinds, and as the trade increases supply that which gives the best satisfaction. In producing extracted honey caution is necessary in not extracting unripe honey and in extracting so much as to rob the bees of necessary stores. Some bee-keepers regular extracting the honey as fact as practice extracting the honey as fast as it is gathered, but honey in this condition lacks the fine flavor that belongs to a good article of extracted honey, and is liable to ferment and sour. None but a thoroughly good article should be produced and placed on the market, as the price will depend upon the quality you offer. You should only produce extracted honey that is equal to the very lest article of comb honey. It is little trouble to secure a crop of but honey, when the extractor is judiciously used, during an ordinary honey yield, whereas at times it is almost impossible to make the bees work in the surplus

> Marketing .- In a short time the honey crop for 1881 will be ready to put upon the market. Particular attention is invited to several good articles on the subject of marketing in the most desirable and profitable manner, which have lately appeared in the Weekly BEE JOURNAL. The Grange Bulletin remarks that "for small retail packages, tin pails with close-fitting covers are the best. Purchased by the gross or in quantities of 1,000 or more, the price is so inconsiderable that no consumer will object to paying what they eost in addition to the price of the honey, for they are so " ' handy to have in the house," that not one housewife in a hundred would wish to return the

Sometimes a noble failure serves the world as faithfully as a distinguished success.—Dryden.

The Clovers.—Yes, Syrian is the word, if only for the sake of euphony. "Holy" is too Oriental, and seems half Bees are doing well here, since we had a shower or two. White clover is very abundant, but in front of my window is a meadow of mixed white and red clovers and there are 5 or 6 Italians on clovers and there are 5 or 6 Italians on the red clover to-day to one bee of any kind upon the others. Lately I visited Mr. Jesse Ridings, of Whitehall, Ill., who had a field of nixed red, white, and alsike clovers, and there were 20 Italians on the alsike to one on any other bloom. He had also a patch of thrifty mehiot, sown last year all my black queens but one; have bred Italians, and have them laying instead of the blacks.

WM, CAMM. stead of the blacks. Wm. Cz Murrayville, Ill., June 6, 1881.

The Prospects in California.—Some time ago I wrote a letter to the BEE JOURNAL, stating how good the prospect was for surplus honey. Now the thing is changed. A month ago some of my neighbors told me that the bees were killing their drones. Having but were killing their drones. Having but few drones, 1 had no surplus and my bees were leaving them alone, but now I observe occasionally a drone being lugged off. Many of my bees have stopped breeding, and commenced again within a few days. Very late frosts have killed what bloom we had, and now the bearbush or hawberry is and now the bearbush or hawberry, is commencing to bloom and honey commence to broom and noney is coming in, and queens laying again. I have obtained but little surplus and very little comb honey, equalizing most of my colonies. I increased from 58 to of my colonies. I increased from 58 to 81 strong colonies, but unless more honey is gathered, 1 shall have to feed back and rear queens in the fall. Queen-rearing, for the present, is useless, un-less one wants them to starve and get less one wants them to starve and get the bees to robbing. All my colonies are full of bees, but they have very lit-tle honey, and only a little brood. One colony had a good proportion of brood in 6 out of 10 combs, and good sage honey to live on through the drouth, which will be on us after the bearbush is through blooming. I notice a great many dead bees about the bush while many dead bees about the bush while in bloom; it appears that the bees gorge themselves and are too weak to take their load home; the bush is swarming with bees during the bloom. What colonies survive the drouth, soon fill up with fall honey, from the golden rod and decaying fruit. Bees do not destroy fruit, but save the juices after birds and yellow-jackets have punctured it. I have watched and seen them leave the santa rosa bloom because they could not bite through the base of the flower, where the honey is. The tube flower, where the honey is. The tube being long only humming birds can sip the honey. By pulling the tube and sucking it one can taste the honey. The locust in this vicinity was a failure, giving no bloom to speak of.

J. D. ENAS. Napa, Cal.

Encouraging.—Bees are doing finely, swarming, filling sections and rearing swarming, filling sections and rearing brood. I got through the winter with 13, bought 10 in Alabama, and had be large swarms. The fields, road sides and commons are white with bloom. I have 3 acres of alsike clover near my bees; they worked on the alsike about a week before they did on the white clover. Basswood will have a very heavy bloom the bulgary interfered. heavy bloom; the buds are just formed.

J. II. THORNBURG.

Manchester, Ind., June 10, 1881.

Testing Cyprian Queens.—Will some breeder of Cyprian queens inform me how I can tell whether my Cyprian queens have mated with Cyprian or Italian droper where all many control in the control of the con ian drones, where all are reared in one yard? I have 43 colonies of fine Italians; 32 are storing surplus now. The Weekly BEE JOURNAL is indispensable to any *live* bee-keeper.

S. E. O'NEEL.

Dupont, Ind., June 14, 1881.

Bee Stings.—I am an attentive reader of the Weekly BEE JOURNAL, and as long as I have a colony of bees, I should be sorry to have to do without it. I am very much interested about bees, but am rather afraid that nature did not intend me for a bee-keeper, for it gives me so much inconvenience when I am me so much inconvenience when I am stung. There seems less difficulty in protecting the face by means of a veil than in knowing the best way to protect the hands. I fancied myself safe till yesterday, by wearing a rather thick pair of brown kid gloves, but in handless the face in the face of t dling the frames without having pre-viously smoked the bees, I was stung on one of my fingers, from which my whole hand is still quite swollen and whole hand is still quite swollen and painful. For some time the inflammation extended all the way up my arm. Perhaps you will say if I am so susceptible to the poison of the sting I had better keep clear of bees. Prof. Cook says that people soon become inoculated and feel every sting less, but I shrink from the idea of that process. Would you advise me to get a pair of rubber gloves? I have seen it recommended to wear white cotton gloves, but should think they would be no betbut should think they would be no betone colony; lost 2 last winter; packed one in chaff and the other in shavings.

II. F. BULLER.
Campbellford, Ont., June 11, 1881.

[Rubber gloves are better than kid, because it is more difficult for a bee sting to go through them. It would be more pleasant, as well as safer, to smoke the bees if they are so cross, and thus prevent them from attacking you .-- ED.]

The Weather, Cause of Losses, etc.-Are the fates combined against us poor fellows, that are trying to cultivate the sweets of nature? It appears as 11 something that is beyond the power of something that is beyond the power of mortals, is trying the endurance of us poor bee-keepers; the elements, at least, are not propitious for the replen-ishing of our monuments of departed sweetness—rain, rain, thunder and lightning and rain, with a little sun oc casionally, just for an aggravation, that we may know that there is one. The white clover is just in its splendor, large and full, and plenteons, but the rains descend and the floods come, and our bees stay, like sensible beings, in out of the wet, getting ready for a grand rush bye-and-bye—a sort of spitting on the hands, like, waiting for the word go—when the weather makers say "now," and I wish they would soon, go—when the weather makers say "now," and I wish they would soon, for my hives are running over with bees, gathering a little honey, just enough to keep soul and body together, a sort of a hand-to-mouth living; but I suppose it is the best they can do, considering how Prof. Vennor and the rest of our weather-makers are running things, and, as Novice says, I don't understand it. By-the-way, what new idea is he going to advance this year? Almost everyone will have some new idea to advance as to the fearful mortality among the bees, but how many will indea to advance as to the learth mortality among the bees, but how many will profit by their past experience? and among us all, who has the right way to winter bees? and unless we judge by their success can we take their way as being the right one? I never wintered being the right one? I hever wintered bees any better than last winter. From Nov. 15 until April 17 they had no flight, and yet 1 only lost 4 from 51, that 1 put up right, and 30f those starved, through my own neglect. I had 6 that I took extra care to have in a correct condiextra care to have in a correct condi-tion, according to authorities, young bees, extra good queens, good scaled honey, and a plenty of it, 3 packed in 6 inches of chaff on the 6 sides, and 3 with the same amount of dry pine saw-dust on 5 sides, and a 6 inch thick blanket of chaff on top, and they all went over the bridge together, for chaff or dust did not save them not a one or dust did not save them, not a one. This spring I found the combs moldy and bees mostly on the bottom of the and bees mostly on the bottom of the hives, with honey in store—so I think I have exploded to my satisfaction, at least, that out-door chaff-packing is chaff, as far as the successful wintering bees is concerned, and is not the correct way to do. Our friend, Lowmas-ter, of Belle Vernon, Ohio, appears jubilant about having a swarm of bees the 29th of May, and gives his opinion rans; of course I depend on them for

40th parallel. You know it is not always safe to laugh as hard as you ways sare to laugh as hard as you can at the first story, for something may come funnier. Well, I had a strong new swarm on the 31st, but that does not beat his in time, although I am almost ti<sub>2</sub>, further north; but I had one the 25th, another the 27th, and have had several since, although his was a Singley swarm (they are considered). and several since, atthough his was a Sunday swarm (they are considered a little extra, you know, for then you have an excuse to stay home from church). Mine were 2 and 4 days earlier. Nearly all the bees have died the past winter in this county, within a radius of 12 miles, that I know of. Of 460 colonies, now less than 70 are alive, aside from my own, of which 1 lost 4 out of a lot of 51. F. W. Charman.

Morrison, Ill., June II, 1881.

Wintering on Cider.—The fall of 1880 came, but no honey crop; there were plenty of cider-mills, fruit-driers, vineprenty of cider-mills, fruit-driers, vine-yards, etc., all around here, and the bees stored a goodly amount of "choice wines and liquors," and were well tixed for a winter's debauch. Winter caught for a winter's debauch. Winter caught me with 5 colonies (1 black and 4 Italians). The blacks and one colony of Italians had about 7 or 8 pounds of honey, including their non-temperance drinks, each. I packed them all in chaff and made my second trial at wintering bees. About the middle of January was consequence of their intensive was consequence of their intensive. nary, as a consequence of their intemperate habits they all had the dysentery. By the middle of February the blacks had reaped the reward of inebriety, and gone down to a drunkard's grave. They left behind them only empty combs and bloated carcasses. Toward the last of March the bees had then first chance for a flight since November, and 4 colonies only took advantage of the "let up" in the weather. The colony that went into winter quarters with 7 lbs., now had 3 lbs. I do not think that many cellars will cause the nees to winter on less than 4 lbs. The mortality of bees in this county has been very great, and I find myself (notwithstanding Heft my bees packed in chaff on the summer stands) one of the losers, both among cellar and chaff advocates. I would say to Mr. Fownly, that he may, if it will benefit anyone, inform his correspondent that I apply the chaff above, below and on I apply the chaft above, below and on all sides, whole and unadulterated and that it will not cause dysentery, if the apiarist will only keep it dry, and if any of his friends will drop into my modest apiary, I will show them a hive that will, every time, winter the bees out-of-doors as well as they will winter in a cellar.

F. L. DRESSER.
Hillsdale Mich. June 12 183. Hillsdale, Mich., June 13, 1881.

Swarming.-1 have wintered 7 coloswarming.—I have wintered 7 colonies in chaff hives (Langstroth), without loss, while so many have lost all their bees.—I purchased 15 colonies of blacks in March, transferred them early m April to Langstroth lives, making my number 22, all in good condition for business. As 1 preferred natural swarming to dividing, I at once clipped one wing of all the queens; I purchased a lot of Dunham foundation, gave one a not of Dinnam foundation, gave one frame of it to each colony, every 5 days, until every hive was full. I arranged all my hives in a hexagonal figure, consisting of 44 hives. My first swarm issued May 18; I was ready with cage in hand; the queen was about the last to leave the hive. I picked her from of feave the live. I picked her from off the sawdust, put her in the cage, put a hive filled with foundation in place of the old one, placed the queen in front of the new hive; soon the bees missed their mother, and came back to look for her. The hive was black with bees, and I let the queen out of the cage and all was over. I have now 43 colonies, all having swarmed but one from which I removed the queen, in order to get cells, in order to Italianize as I go along; and this is the way I did it: Allowing 16 days for a queen to hatch, my queens hatched June 1, at which time my bees had swarmed; as last as they swarmed I cut out all the black cells and introduced an Italian cell; by June 2 all my Italians were hatched. I purchased a the tested Italian queen, and all the queens were from her, and they are beauties. The 7 I wintered were Ital-

that it cannot be beaten North of the 400 the drones. With my honey knife as 400 parallel. You know it is not alsharp as I could get it I went to my black snarp as recondiget it I went to my black colonies every 6 days and clipped the heads of all the drones that were capped. By repeating the process above stated I have not a black drone in my apiary, and none very close to it. and my young queens stand a good chance for a pure impregnation. In all the swarming I lost only one queen, which I failed to catch on coming out, but she flew to the hive, just in front of but she flew to the live, just in front or one that had swarmed the day previous; I gave the new swarm a cell instead of the old queen. There is one great trouble with swarming as above men-tioned; the bees on returning would try and get in any hive they could, until I was compelled to close all the entrances when a swarm issued. Has any one had similar troubles with swarms?

Poseyville, Ind. J. F. Kight.

Winter and Spring.—The long, cold winter has passed away, and with it most of our bees. I commenced the winter with 23 colonies; I intended to pack them in straw and chaff, but was unavoidably prevented. I left 15 of the heaviest out without protection, except a bank on the north that broke the force of the wind, and during part of the time they were under the snow; S of the lightest I buried, in a pit out of of the lightest I buried in a pit out of the reach of frost; of these 5 came out with five bees in them, but 2 were very weak, so that I united them with one of weak, so that I united them with one of the others, one I have lost since from queenlessness; out of the 81 have but 2 good colonies left. Of the other 45 I have 5 good colonies left; one cast a good swarm on the 5th, which makes 8 colonies, at present, in good condition. The loss of bees was heavy here, the past winter, but the spring has been past winter, but the spring has been very favorable for what came through to build up, and they are generally in good condition now. Bees are getting some honey from white clover, but we have never got any surplus from that source yet. The prospect for basswood is good, of which we have an abundance. As to the guise of our disabundanee. As to the cause of our disabundance. As to the cause of our ois-asters in wintering I cannot indorse Mr. Heddon's theory. Mr. Doolittle ex-presses my views, exactly. I like the Weekly BEE JOURNAL, and intend to renew, so as not to miss a number.

J. G. Purvis. Hartford, Iowa, June 13, 1881.

White Clover Short.—Bees are building up very slowly. Whate clover is not more than half a crop, so far, owing to severe spring drouth. We have had line rains during the past few days, and I hope tor a good crop of honey. I am much pleased with the JOURNAL; wish you and it success.

G. W. JENKINS.

New Liberty, Ky., June 9, 1881.

Spring Dwindling.—My loss of 9 out spring Dwinding.—My loss of 9 out of 18 colonies occurred during the first part of April—the worst time for bees 1 ever saw—they are now in good condition. My best Italian colony supplied 2 full frames of capped brood to help build up those weak. I have had a large natural swarm, and now have 18 two-lb. natural swarm, and now have is two-to-boxes nearly filled with honey. White clover is abundant. There is at least 1,000 acres to every colony of bees near here.

Philip P. Nelson.

Manteno, Ill., Jane 10, 1881.

Grafting Wax.—Can any of the readers of the Bee Journal give a receipt for grafting wax, that the bees will not gnaw? My orchard surrounds my apiary, and the bees trouble it very much in this way. I would like a receipt that is not composed in part of beeswax, if any such is known.

Glensdale, N. Y. N. F. Case.

Good Prospect for Honey .- Basswood is full of buds, and there is plenty of honey in all the flowers. My first swarm came out on June 6: I have 30 colonies, and 2 young queens laying. colonies, and 2 young queens laying. I bought 10 colonies for \$50. Some of them had brood in every comb. The cause of bees dying last winter was dampness, cold, long continement, breeding too soon in winter quarters, and being put out too early.

EAVETTE LEE FAVETTE LEE.

Cokato, Minn., June 11, 1881.

Do Bees ever get to be a Nuisance?— In your No. 23 Mr. Heddon asks for intorination relative to the above subject. Our Iowa "code" defines a "nuisance" Our Iowa "code" defines a "nuisance" to be "whatever is injurious to health, or indecent or offensive to the senses, or an obstruction to the free use of property so as essentially to interfere with the comfortable enjoyment of life and property," and when found to be a nuisance under the above definition may be enjoined or abated. Under the last clause of the section above, anoted may be enjoined or abated. Under the last clause of the section above quoted it would seem that bees might, at times, be included. If my neighbor owns and operates a sugar refinery, and I keep adjacent thereto a large apiary, to his annoyance, discomfort or disadvantage, I do not see why the bees could not be annoyance, discomfort of disadvantage, I do not see why the bees could not be declared a nuisance just as a stinking hog pen, kept within easy range of his olfactory nerves, could. I do not know of a case where the question of damages by bees has arisen in our courts, of a case where the question of camages by bees has arisen in our courts, but I do not see why they should not be controlled to the extent of not interfering with our neighbors' rights, as well as any other class of property. While we are supposed to have a right to life, liberty, and the pursuit of happiness in our own chosen vocation, and the enjoyment of property, we are not to deprive another of the same right. Our individual rights ought to be subservient to the public good, and if we cannot pursue an occupation without injury to our fellow citizens, we ought to choose some other business. If beekeepers would also keep the Golden Rule in their hearts, and when so unfortunately located as to cause annoyfortunately located as to cause annoyance or discomfort to their neighbors, whose occupations attract the bees, if they would endeavor to do right, very little complaint would be made. EUGENE SECOR.

Forest City, Iowa, May 13, 1881.

Died of Dysentery.—I lost about 80 per cent, of my bees. I had them packed on their summer stands; they were confined too long and died with dysentery. They are doing well now; beginning to swarm and working in dysentery. They are doing not beginning to swarm and working in sections. I wish the BEE JOURNAL HIRAM J. WARD.

May 8, 1881.

#### CLUBBING LIST.

We supply the Weekly American Bee Journal and any of the following periodicals, for 1881, at the prices quoted in the last column of figures. The first column gives the regular price of both:

The Weekly Bee Journal (T. G. Newman) \$2 00 and Gleanings in Bee-Culture (A.I. Kingo) \$3 00. 2 75 Bee-Keepers' Magazine (A.I. Kingo) \$3 00. 2 75 Bee-Keepers' Exchange (J.H. Nellis), \$2 75. 2 50 The 4 above-named papers. 475. 3 75 Bee-Keepers' Instructor (W.Thomas) \$2 50. 2 35 Bee-Keepers' Ginde (A.G. Hill). \$2 50. 2 35 The 6 above-named papers. 575. 5 00 For Semi-monthly Bee Journal, \$1.00 less. For Monthly Bee Journal, \$1.50 less.

Local Convention Directory.

Time and Place of Meeting. 1881. Time and Place of Intering.
Sept. — National, at Lexington, Ky.
—Kentucky State, at Louisville, Ky.
Oct. 11, 12—Northern Michigan, at Maple Rapids.
12—Ky. State, in Exposition B'd'g, Louisville, Ky.
W. Williamson, Sec., Lexington, Ky.
27—Western Mich., at Berlin, Mich.
Wm. M. S. Dodge, Coopersville, Sec.

In order to have this Table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

#### Honey and Beeswax Market.

CHICAGO.

11ONEY—The market is pientifully supplied with honey, and sales are slow at weak, easy prices. Quotable at 16c418c, for strictly choice white comb in 1 and 2 lb boxes; at 10c42c, for common dark-colored and broken lots. Extracted, 7%c949c.
BEESWAX.—Choice yellow, 26c23c; dark, 15@17.

#### NEW YORK.

HONEY.—Beat white comb honey, small neat ackages, 14a/7c.; dark 11a/12; large boxes 2c. less.— /nite extracted, %ulbc.; dark, 7a/8c. BEESWAX.—Prime quality, 20a/25c.

#### CINCINNATI.

lloney.—The market for extracted clover honey sood, at 8@10c. Comb honey is of slow sale at lcc. or the best.
BEESWAX-18@22c. C. F. MUTH.

#### SAN FRANCISCO.

SAN FRANCISCO.

HONEY.—A few cases of new, both extracted and comb, have arrived—not enough to attract anyone but a retail buyer. Large offerings woul not be apt to solicit much attention from canners just now, as they are busily engaged on fruits. Stocka of old extracted are firmly neld.

We quote white comb, 12614c; dark to good, 96 ltc. Extracted, choice to extra white, 867c.; dark and candied, 565½c. BEESWAX—21925c., STEARNS & SMITH, 423 Front Street. San Francisco, Cal., June 9, 1881.

#### SPECIAL NOTICES.

Single copies of the Journal are sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

When changing a postoflice address, mention the old address as well as the new one.

The Volume of the Bee Journal for 1880, bound in stiff paper covers, will be sent by mail, for \$1.50.

We have prepared Ribbon Badges for bee-keepers, on which are printed a large bee in gold. Price 10 cents each, or \$8.00 per hundred.

Notices and advertisements intended for the Weekly BEE JOURNAL must reach this office by Friday of the week previous.

Many Lose Their Beauty from the Balsam supplies necessary nourishment, prevents falling and grayness and is an elegant dressing.

Constitutions and By-Laws for local Associations \$2 per 100. The name of the Association printed in the blanks for 50 cents extra.

We can supply but a few more of the back numbers to new subscribers. If any want them, they must be sent for

Instead of sending silver money in letters, procure 1, 2 or 3 cent stamps. We can use them, and it is safer to send such than silver.

Sample copies of the Weekly BEE JOURNAL will be sent free to any names that may be sent in. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

The date following the name on the wrapper label of this paper indicates the time to which you have paid. In making remittances, always send by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, and local checks, are not taken by the banks in this city except at a discount of 25c., to pay expense of collecting them.

PREMIUMS.—For a club of 2, weekly we will give a copy of "Bee-Culture;" for a club of 5, weekly, we will give a copy of "Cook's Manual," bound in cloth; for a club of 6, we give a copy of the Journal for a year free. Do not forget that it will pay to devote a few hours to the Bur Laurnar. hours to the BEE JOURNAL.

At the Chicago meeting of the National Society we were requested to get photographs of the leading apiarists, to sell to those who wanted them. We can now supply the following at 25 cents each: Dzierzon, the Baron of Berlepsch, and Langstroth. The likeness of Mr. Langstroth we have copied, is one furnished by his daughter, who says, "it is the only one ever taken when he was in good health and spirits." We are glad to be able to secure one of such a satisfactory nature.

It would save us much trouble, if all would save us much trouble, it all would be particular to give their P.O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name. Many others having no Postoffice, County or State. Also, if you live near one postoffice and get your main at another, be sure to give the address we have on our list. dress we have on our list.

An Old Lady writes us: "I am 65 years old and was feeble and nervous all the time, when I bought a bottle of Parker's Ginger Tonte. I have used a Parker's Ginger Tonic. I have used a little more than one bottle and feel as at 30, and am sure that hundreds need just such medicine." See advertise-

# 15 DOLLARS WORTH FOR \$1.

We will send the ten books described below, by mail, post-paid to any address, on receipt of \$1.

and for twenty-five cents extra, sent at the same time, will include one year's subscription to
FARM AND FIRESIDE, the leading agricultural and home journal of the world.

PARTICULAR NOTICE.—We reserve the right 'to withdr withis Dollar Cifer at any time, there ere suscerbe at once if you want these TEN BOOKS FOR ONE DOLLAR, and tell all your friends we have made the grandestoffer of the century.

# The Bee-Keeper's Guide; Given's Foundation Press.

#### MANUAL OF THE APIARY, By A. J. COOK,

Professor of Entomology in the Michigan State Agri-cultural College.

#### 320 Pages; 133 Fine Hustrations.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value — E.Ap(culture, Paris.

1 think Cook's Manual is the best of our American works,—LEWIS T. COLIV.

It appears to have cut the ground from under future book makers,—British Bee Journal.

Is a masterly production, and one that no beekeeper, however limited his means, can afford to do without,—Nebraska Farmer.

Is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without.—Nibraska Farmer.

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the aphary.—J. P. WEST.

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—E. H. WYNKOOP.

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret having purchased.—Michigan Farmer.

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Herald, Monticello, Ill.

My success has been so great as to almost astonish missit in necessity. Prof. Cook's Manual is an exhaustive work.—Herald, Monticello, Ill.

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—W.M. VAN ANTWERP, M. D.

This book is promounced by the press and leading business to be excluding in Europe or America; a scientific work on modern bee management that every experienced bee-man will well me, and it is essential to every amateur in bee-culture. It is handsomely printed, nearly bound and is a credit to the West.—Western Agriculturist.

This work is undoubtedly the most complete manual for the instruction of hee-keepers which has ever been published. It gives a full crylanation regarding the care and management of the aparty. There is no subject relating to the culture of bees left intouched, and in the compilation of the work Prof Cook has had the advantage of all the previous knowlede of apairists which he uses admirably to promote and misk popular this most interesting of all occupations.—American Inventor. It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-risers.—Ky. Lies Nock Record.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The ric

richest reward awaits its unifior.—A. E. WENZEL.
It is a credit to the author as well the publisher.
I have never yet met with a work, either French
or foreign, which I like so much.—I Abber Dr
Bots, editor of the Balletin D' Apiculteur, France.
It not only gives the natural history of these industrous insects, but also a thorough, practical,
and clearly expressed series of directions for their
management; also a botanical description of honey
producing plants, and an extended account of the
enemies of bees.—Democrat, Puliski, N. Y.

enemies of nees,—Democrat, Puliski, N. Y. We have perused with great pleasure this rade mecun of the bee-keeper. It is replete with the best information on everything belonging to aprailine. To all taking an interest in this subject, we say, obtain this valuable work, read it carrilly, and practice as advised.—Agriculturist, Quebec, Canada.

If may safely be represented.

bec. Canada.

It may surfely be pronounced the most complete and comprehensive of the several minuals which and comprehensive of the several minuals which the several minuals which are several minus which the several minus which the several minus which the several minus which is a pairries. The studies of the structure of the bee, the different varieties, the various bee products, and following these the points of management, extending to the smallest details, are all of high and practical value. Prof. Cook has presented the very latest phases of progressive bee keeping, and writes of the themes discussed in the light of his own experience. Pacific Rural Press.

Of the many excellent works which we have ex-

of the many excellent works which we have examined on bee-culture, we consider Prot. Cook's the most valuable for the study of those who contemplate going into the business or are already keeping bees. If thoroughly studied, and its teachings conformed to, by the apiarist, who exercises a reasonable degree of common sense, he or she cannot fail to achieve at least a reasonable degree of success. The author of resses himself to the work with a degree of enthusiasm which carries the reader along with him to the end.—Kansas Farmer.

#### The Cause of Bee Dysentery.

C. J. ROBINSON.

The length of time during which bees The length of time during which bees can bear confinement without inconvenience, depends greatly on circumstances. They may endure it 4 months or more, wholly uninjured, or they may be ruinously affected, if shut in only a few days—according to the nature of the food and the amount consumed, the dry or damp state of the air they respire, or the degree of cold to which they are exposed. When they are kept quiet in a uniformly moderate temperaquiet in a uniformly moderate temperature, the consumption of food and consequent accumulation of excrement will be small, and prolonged contine-will not discommode them. But when the honey they consume in the winter is thin and watery, and has remained unsealed in the cells, the consumption will be greater, the accumulation of excrement more rapid, and its retention more difficult. And if the quality of honey is unsuitable the bees feed on pollen (all stores of farina ought to be taken from colonies before going into long confinement), dysentery is the inevitable result. So, also, where the colony is subjected to frequent disturbance, rousing and exciting the bees, or the rousing and exciting the bees, or the changes of temperature are frequent and great, or the general temperature in which they are kept is very high or

simply been at fault, permitting involuntary evacuations.

It has been supposed that from atmos-

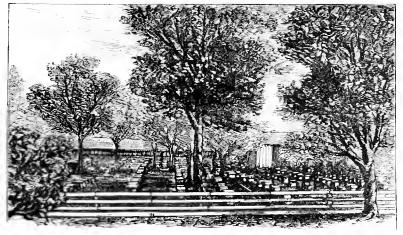

It has been supposed that from a thospheric causes dysentery sometimes assumes an epidemic character, affecting the apiaries in a wide range of country. Such was the case in Lusati, Germany, in 1840, when more than 3-5 of all the colonies there were destroyed. Ehrenful was led the destroyed. colonies there were destroyed. Ehrenfels recorded the destruction of an entire apiary, consisting of more than 300 colonies, by dysentery, resulting from the consumption of unsealed viseid honey, gathered from pine or fir trees. This contained only a small proportion of saccharine matter, in a large mass of crude and indigestible substance. Poor honey, with bee-bread, produces no injury, if consumed when the bees can fly freely, because they are then able to evacuate their excrement, but confinement while they are restricted to such diet, proves disastrous. Pure honey seems to be "the staff of life" for bees and their larve. Pollen, if they have it, forms a useful condiment for both mature bees and larve, but tire apiary, consisting of more than 300

but if you introduce pollen plentifully, they become filled, and if you let them have a flight they drop large, colored

discharges.

The disease called May sickness is not dysentery, but constipation, though it also results, in some cases, from the consumption of bad honey. Fecal matter accumulates in the intestines and ter accumulates in the intestines and rectum, accompanied by an inability to evacuate, resulting from the sluggish condition of the viscera. Breeding bees appear to be particularly liable to this disease. We find them leaving their hives and crawling about on the ground, unable to fly, and with the abdomen inordinately distended. It rarely happens that any considerable number are thus affected at one time, though some are found, every season, in colonies that are populous and have much brood.

It is sometimes thought to be caused among the breeding bees or nurses, by excessive consumption of honey and pollen, and prolonged through voluntary confinement.

Apiary of Mr. J. H. Robertson, Pewamo, Michigan.

both can do without it. They are certainly wrong who say that pollen is indispensable to the raising of young dispensable to the raising of young bees, and that it is consumed exclusively by the larve. Abundant brood has been raised by experiment while they were shut up on new combs, and fed on refined sugar syrup, when they could not get a grain of pollen from any source. That bees consume new pollen source. That bees consume new pollen greedily in the spring, as an acceptable change from their old stores, is proved by its cathartic affect on them, as they soil their hives and combs badly for a

For the American Bee Journal.

#### Wintering of Bees in Canada.

P. P. N. E. PELISSIER.

On Nov. 2, 1880, I put 12 colonies in a dry, sandy cellar. On March 8, although the weather was rather cold, I put them out and they had a good cleansing flight. In the evening I put them back in the cellar, where they remained very quiet until 1 took them out for good, April 20, when one of the colonies was queenless, and the other bees robbed it. In the evening of the 23d I removed it to the stand of a very strong colony. soil their hives and combs badly for a few days after an abundant yield of early pollen, when they are smoked or moisture in the hive.

Exposure to cold and hunger will be followed by dysentery, and if, immediately after gorging themselves with honey, bees be placed in a temperature of 50° to 55°, they will certainly be subject to dysentery within 24 hours. It is difficult to say whether this results from an infection of the intestinal canal, or whether the instinct of the bees has

queenless colony a frame of brood from queenless colony a frame of brood from my Palestine colony, with what bees were adhering to it. These holy bees, who had perhaps helped the robbers, now took possession of the hive, drove out the robbers, including the natural owners of the hive, and at last that handful of Palestine bees remained in possession of the hive. On the after-noon of the 25th I transferred these plucky little fellows to another hive, be-cause their number was too small to constitute a colony. constitute a colony.

1 also wintered 3 colonies on the sum-

also wintered 3 colonies on the summer stands; they came out all right, but the strongest colony starved during a cold spell from the 28th of April to May 8; they had a lot of young bees, eggs and brood in all stages. I transferred the capped brood to another hive

and it was saved.

The hives that I put in the cellar are The hives that I put in the cellar are 2 story, made of humber 5-16 of an inch thick, 8 frames in the lower story and 7 in the upper one; the frames are 10 inches high and 15 inches long inside; the cap is 12<sup>1</sup>4 inches deep, and completely covers the upper story and laps over the lower one. I can secure more honey with bees in this hive than any style I know of. By removing frames of sealed brood, and the outside frames which are generally partly filled with of sealed brood, and the outside frames which are generally partly filled with house to the upper story, it leaves plenty of room for the queen to deposit eggs, and I believe it stimulates the bees to greater exertion, for as quick as the bees hatch they fill the cells with honey. I never extract until the combs are at leaves? Sould least  $^2{}_3$  sealed.

The winter hives are made of  $^7{}_8$  inch

lumber throughout; there is one inch space between the double floor, sides space between the double floor, sides and caps, which is filled with the best out chaff; the front and rear, in addition to the space filled with chaff, have a division board  $\Omega_2$  inches from the inner wall, which forms a chamber to receive a frame, where bees will store surplus honey very readily. The division boards at the front and rear are the supports for II other frames, which run supports for 11 other frames, which run from front to rear; all of these frames are 12 inches deep and 15 inches long; 13 frames in each hive, 11 one way, and

In the fall, by taking out the front and back frame, it leaves a dead-air space of 134 inches front and rear, and by taking out a few frames from each side and inserting division boards, it

side and inserting division boards, it leaves a dead-air space all around.

For 2 years I wintered 7 colonies without further protection, and without loss, except what dropped on the snow when they flew out. Last fall 1 put a chaff cushion on the top of the frames, and a board inclined over the door. and a board inclined over the door, which I covered with straw, to prevent of the straw from the entrance, but the straw from the cold did not abate from Oct. 20 to March 7. On March 8 t took off the straw from the entrance, but the

This year promises to be better for honey than last; although we are get-ting considerable rain there is a fair flow of honey; in a few days we shall have hundreds of acres of red raspberries in bloom. One of my colonies has already stored 53 lbs. of honey, which consider excellent for the Province of

Quehec.
Over 50 per cent, of the bees in Ottawa Valley will never buzz again; not tawa vancy will never ouzz again; not one bee-keeper in a hundred is up to the times, simply because they do not read the BEE JOURNAL. Long life to it and to its editor.

Pelissier, Quebec, June 3, 1881.

For the American Ree Journal.

#### The Prospect for Honey and Prices.

J. H. MARTIN.

Let us look the facts squarely in the face and we will find that the tendency will be toward lower prices. In 1880 the bee-keepers of our country had full apiaries, and every hive was teening with workers, but our honey yield was only a third of a crop, on account of the only a finite of a country, on account of the unfavorable weather for honey produc-tion. We had many predictions that the price of honey would advance, but when the market opened in the fall the quotations remained about the same, with little, if any, improvement over the previous year, when we had an abundant yield.

abundant yield.

The same predictions are made again because over 50 per cent, of the bees are dead. There might be some basis for a hopeful view if the honey crop should be short, but every indication points to an abundant yield. It would, therefore, have been necessary to have lost over <sup>9</sup><sub>3</sub> of the bees to make any difference in the price of honey. If the loss had been 75 per cent, all over the United States there might be a slight prospect of States there might be a slight prospect of better prices, for then our glucose friends. would have to pay a little more for our honey in order to get enough to adulter-ate. We never saw the prospects for honey better than at present; our fields honey better than at present; our helds are white with clover, and our strongest colonies are filling their surplus combs quite rapidly. Basswood, in a few weeks, will fill the air with fragrance. Young trees on our "Linden avenue" that have been set out 7 years are laden with bids. If the weather is favorable nothing can prevent there being as much if not more honey int. being as much, if not more honey put upon the market than in 1880. Therefore I can see no prospect of better prices. Hartford, N. Y., June 14, 1881.

| Nevertheless we can see no reason for changing our opinion expressed on page 172.—Ep.]

For the American Ree Journal.

#### Dysentery as a Bee-Disease.

WARREN PERCE.

ont honey-board or chaff-cushion above them, but having an empty rack for sections making an open air space of 1,600 cubic inches over the bees, and protected by the ordinary Langstroth S-inch cap. They came through far the best of any I had, never having a symptom of dysentery. I attribute the whole difference in the wintering of the two to upward ventilation; the first had none, the last most ample.

Two other bee-keepers in this vicinity report cases like the last named, where the honey-boards were left off and the bees had no protection over-

where the honey-boards were left off and the bees had no protection overhead but the empty cap, and the colonies are the best they have this spring. Another had a piece of common sheeting, which the bees had cut full of holes, laid on in place of a honey-board, and still another hive which stood on a hillside was so low that water would run in at the rear, across the bottomboard and out at the front, when a thaw occurred, and yet, as I believe, owing occurred, and yet, as I believe, owing to no honey-board, but a case in its place full of empty sections, that colony had no dysentery, but was in good con-dition, except one or two moldy combs. I could name other similar cases, but there are sufficient. Will not others these are sufficient. Will not others who can furnish any evidence either for or against this theory of the cause or a factor in the cause of this malady do so, as in this way much good may

Garretsville, O., June 16, 1881.

From the Home Journal.

#### Transferring Bees from Box Hives.

G. W. DEMAREE.

Transferring bees from box hives and bee gnms is an operation well understood by skillful bee-keepers, and should be understood by those who only keep few colonies, and give the subject but fitle study. Anything that is worth little study. Anything that is doing at all should be well done.

The old plan of "driving bees" from one hive to another, when a change is desirable for any cause, forcing them to desert their young (the most valuable part of the colony), is not only barbar-ous, but is attended with much uncerous, our is attended with much incertainty. If the queen chances to go with the hees, and the honey season is favorable, all may work well. But if the queen is contrary and refuses to leave with the home refuses to leave with the bees, as is very frequently the case, the new colony will be left queen-less and without eggs or larvay from less and without eggs or larve from which to rear a successor, and the ex-periment will be a failure. These dan-gers are avoided by transferring the combs containing all the eggs, larva-and sealed brood with the mature bees. If the queen should be lost in the operation, the colony is in precisely the same condition they would be in if a swarm had issued in the natural way from their home.

from their home.

Transferring bees is a very simple operation after you get the hang of it. Of course there are many methods of proceeding, every one of which has its advocates. Without giving the several methods, all of which will generally give success, I will describe the operation just as I perform it with universal success. The tools necessary are a good bee smoker, hatchet, and a thin, strong cold chisel, a long, thin-bladed knife, a ball of wrapping twine (such as is used by hardware men), and After a careful perusal of the various reports and theories presented in the BEE JOUENAL, and a study of conditions and results in my own apiary, and those of my neighbors. I fail to find any evidence supporting the theory that the trouble is caused by "bacteria," and none to support the starvation theory advanced by an able apiarist.

For the purpose of drawing out a further discussion of the subject, and, if possible, acquiring additional knowledge on this important question. I will offer a few facts which have come under my now postervation.

In the fall of 1880 I had about 40 colonies, but owing to protracted illness, they were not properly prepared for winder, and only 5 survived. Two of the 40 I wish to notice. The first was a superior of the first was a superior of the subject and the result of the acquiring additional knowledge on this important question. I will not only 5 survived. Two of the 40 I wish to notice. The first was a superior of the first was a superior of the subject and the colonies, but only 5 survived. Two of the 40 I wish to notice. The first was a local matter of the first was a local matter of the first was a local matter of the subject and the report of the other, for 15 or 20 minutes—when the first was a local matter of the first was a local matter of the subject and the result of the first was a local matter of the liver on the floor of my cellar, I and the none of my bees died in winter, and one to support the startion theory, and then return to each of the liver of the local was not been one on the floor of my cellar, I then the first was a local matter of the local matter of the local of the local matter of the local matter of the local matter of the way of and then return to the doing the matter of the local matter of the

nies on May 12; on May 141 destroyed capped queen cells in 4 more; the other colonies had queen cells containing agreement cells containing leaving 30 to 40 lbs. of good sealed honey in the hive. It was not starvational to keep only a pure race of Palestine on June 41 began to rear Palestine queens. I have now a fine lot of drones (from imported queens) flying, but I did not want to rear queens before this month.

This year promises to be better for This year promises to be a choice clover honey. They died from thoney. They died from the worst case of dysentery lever saw, they died from the worst case of dysentery lever saw, they died from the worst case of dysentery lever saw, with the cold chose cut the nails and the comb so that it will just fill the comb is son, and through carelessness left without a dight.

The other, scantily supplied with stores, mainly gathered late in the seafunction above them, but having an empty rack for sections making an open air space of 1,600 cubic inches over the bees, and protected by the ordinary Langstroth to the frame; hang the frame in the collose from one side of the hive, and the worst case of dysentery lever saw, with the cold chosel cut the nails and the comb so that it will just fill the comb so that it will the comb so that it will just fill the comb so that it will just fill the frame on it and cut the comb so that it will just fill the frame on it and the comb so that it will just fill the comb so that it will the comb so that it will the comb so that it will just fill the frame on it and the comb so that it wil to the frame; hang the frame in the new hive, and proceed in this way till all the worker combs that are fit for use have been transferred to the frames. The combs containing brood should be placed in the center of the hive, all toplaced in the center of the hive, all to-gether. If there are not enough good combs to fill the hive, fill with empty frames. Now brush all the young bees that may be sticking to the old hive and refuse combs into the new hive, and cover the frames with a quilt or honey-board. Then remove the hox from the old stand, and put the new hive in its place and proceed to thive. hive in its place, and proceed to "hive" the bees from the box into the new hive just as you would do if hiving a new swarm that had issued in the usual way, and the work is done. I transfer guite a number of colonies every spring in this way, and have never made a single failure.

#### Wintering Bees in Minnesota.

WM. FRITZE.

In the question drawer of the North Eastern Convention, as given in the BEE JOURNAL of March 2, 1881, I no-tice the following question:

Will it pay to construct an inner box just large enough to hold combs to winjust large enough to hold combs to winter 5. Langstroth or 5. Quinby frames, that will set in the main hive, the object being to carry just what is needed to the cellar, instead of the main hive; they can also be used for nucleus hives in summer? No.

I should say yes; but how are we to do it in the Langstroth bive, unless it is 18x20 inches inside, and that will be considered too large, by many, but it is none too large to hold 3 pecks of bees. I think a peck of bees with 7 or 8 frames of brood is a good colony. I use the Langstroth frame as well as one 9x13 inches; the hive to hold the latter frame is 17 inches from front to rear, 95 inches from side to side, and 11 inches deep: is 17 inches from front to rear, 958 inches from side to side, and 14 inches deep; for extracting I use it 2 stories high, and it takes 24 frames crosswise, 12 below and 12 above. For this hive I have a nucleus hive, to winter in the cellar, and must say I like it. The nucleus hive is 958 inches from front to rear, 712 inches from side to side, and 14 inches deep. This hive can be put into the main hive in early spring, and in the fall, when it is time to put them into the cellar, I take it out and can get away with it nicely. This nucleus hive holds 5 frames, and it is very seldom that I cannot get them on these 5 frames, when I put them in the cellar; they when I put them in the cellar; they will winter well, and need no flight in 6 will winter well, and need no flight in 6 months, till pollen is plenty. They generally cover these 5 frames in the spring, and are ready for business. They also winter well in the Langstroth hive (I use both side by side), providing a good colony is put on 4 Langstroth frames, they will, once in a while, cluster outside on the entrance, and that is just what I like. I do not mean to say

and sometimes  $\theta_2$  months, without a tlight.

My bees never breed in winter, but when I put them out in May they have a little brood, so they are about 8 months without raising much brood, and still they do well. Some say:

"Feed your bees in September; if they rear brood they will build up strong for winter. My experience is opposed to this plan. If the bees are rearing brood in August or September I let them alone, and if they are not strong enough for wintering. I unite them with weak of the said in they are not strong enough for wintering. I unite them with weak ones. If they have a young queen, in October, and cover 2 Langstroth frames of sealed honey, they are good enough for me, and will cover these two frames in May and give as much honey as any others, but no increase.

Duluth, Minn.

For the American Bee Journal.

#### Dysentery Once More-Its Cause.

E. B. SOUTHWICK, M. D.

Some time ago, when traveling in a strange country, I put up for the night at a small town, and learning that there vas a physician there that doctored as I was a physician there that doctored as I did, I called on him and found him sick "even unto death," as he supposed. The doctors had said he could not live until morning, the family had become resigned, the minister had made his last prayer with him, and everything was arranged for his thal departure before the dawn of another day. I asked to examine him, to which they consented, and after doing so and asking a few questions, I told him that without sented, and after doing so and asking a few questions, I told him that without a murder or an accident he could not die before morning; and what was more, he was not really sick; that there was no disease about him. He inquired where I was from; I named the college that I graduated at. He had confidence in their teachings, and asked my advice. I told him when hed-time came to go to bed, have his family do the same, and extinguish the lights as though there had never been any sickness in the house, and rest until morning and he would feel like a new man. He asked me to call in the morning before I left; I did so. He was sitting up eating his I did so. He was sitting up eating his breakfast and said he followed my advice to the letter, and he really felt like a new man. The doctors, as I learned vice to the letter, and in recognizing a new man. The doctors as I learned afterward, laughed at my presumption, but the man recovered. Now we have bee-doctors from the North, South, East and West who know all about this dysentery; though they disagree with each other, they will all agree in laughing at my prosumption. ing at my presimption.
I think my statement of April 7th was

I think my statement of April 7th was not properly understood. The bees did come out, or how could they spot the hive on the outside? The rain destroyed the honey in the flowers, but did not prevent their coming out. The other swarms made at the same time, that had warms made at the same time, that had honey, did not have the dysentery. When I gave honey to those that did have it, they did not fly out any more than before, but they recovered from the than before, but they recovered from the dysentery. I looked for the cause, found it (no honey), gave them the remedy, and they recovered. But if it was a flight they wanted, I did wrong; I should have taken out the bees, frames and all, carried them a little way off, and shook and brushed the bees until I made them fly, and then return the bees to the hive; but I did not do that way.

were closed up 3 days and 4 nights. Being a novelty there, they were handled in all shapes to get a sight of the queen and the yellow stripes on the bees. and the yellow stripes on the be They were near the organ stand, who music and tumult was the order of the day. They showed no signs of dysentery, though worrying through the day Bees are confined and trans to get out. Bees are comment and transported hundreds of miles without producing dysentery. But I do not wish to write of what does not produce the disease, but what my own observation convinces me does produce it.

In looking over my bees and cleaning out the hives. I found every dead colony without honey. My hives are so arranged that when well packed the bees can go to any part, as they pass through the center of the combs. I found that those bees that were on the bottom and contered between and henging to the scattered between and hanging to the combs, not in them, were less in bulk than those found in the cells. I also noticed that the amount of filth on the combs and hive was always in proportion to the amount of bees out of the cells. That was so regularly the rule that when I opened a hive I could easily that when repended a live recondensity tell if I was going to have a long job there to get the bees out of the combs, as the bees in the combs were always so crowded with their feees that it was not crowded with their feees that it was not only a slow, but a very nasty job. And here let me tell how I did it. I would turn the top-bar down and rap on the side of it, when most of the bees would come out or protrude so I could pull them out with my lingers. My conclusion from the above is this, that the bees not in the cells are those that die first, and before they die they crawl around discharge their feces on the around, discharge their feces on the combs or hive, and thus are less bloated by them. In some hives I found the bees all huddled together in among the bees an induced together in among the combs, and just here the cells were tilled with bees. In this case the hives and combs would be clean, and I concluded that at the time of their death, and before, it was so very cold they could not move. In these the bodies were alike tilled with feed parter.

filled with fecal matter. I will give my version of the cases mentioned in the BEE JOURNAL in criticising my belief, and for which the editor has my thanks, for I deem it a kindness in a man to attempt to con-vince me if he thinks I am wrong, and which me is the thinks I am wrong, and a great favor if he gives me real reasons why I am wrong. Bees die with plenty of honey in the hive. This was partly answered in my last article, but I will say that those stupid bees that have not life enough to work their way down into the cluster starve, and before they die they crawl over the combs and discharge they crawfover the combs and discharge their feces; the next under them will do the same, and the last will be found in the combs over which the bees had concentrated, and still there may be plenty of honey that these nearly dead bees have crawled over and besineared. Again, bees that have the dysentery are cured by a flight out-of-doors or in the house. If a colony has been in so long that some of the most stupid bees have died with dysentery, there will be many more that are too stupid to work their way to the uncapped honey, but if the way to the uncapped honey, but if the whole colony can be effectually stirred up, either by an out-door or in-door flight, it will give those half-starved bees a chance to get at the honey and be restored, and all will have an equal chance again, as when first put up in the fall. Again, bees that have been confined for shipment, either queens or colonies die with or have the dysentery. colonies, die with or have the dysentery. The first thing the bees of a colony do when disturbed is not to fill themselves as claimed by some, but to rush out and defend themselves; they will fill themselves when subdued. Now, I believe some bees when confined will commence to worry and try to get out, and continue to do so until they die, and these will not touch food until they die some will worry themselves to death before starvation produces dysentery, others do not, but have the dysentery, daub up their hives or cage, then die.

Dr. Howard, in his article of the 24th Dr. Howard, in his article of the 24th of April, says that the dysentery my bees had was caused by confinement. Now, if one of my horses should die in the field on a pleasant, clear day, and somebody in Boston that knew nothing of the case should write me that the horse was struck by lightning I should

not believe it, neither will I believe that confinement caused the dysentery in my bees, for confinement was as far from them as lightning is from us in a pleas-ant day. The Doctor speaks of those stupid bees. If he is a practising phy-sician, he knows that it is a common thing for a revival to come just before death, in which the patient will be quite death, in which the patient will be quite strong, and then sink away and die; this may be the case with the bees. The Doctor's experience and mine with starved and dysentery bees are exactly the opposite, but as this is not the first time doctors have disagreed, we will agree to disagree. But who shall decide? agree to disagree. But who shall decide? Your own experience, reason and knowledge of facts; and remember that one known fact is worth more than the opinion of all the doctors in the world. I notice that Messrs. Doolittle and Heddon are discussing the subject, and I high, they are both more suggestial.

I think they are both more successful in destroying each other's theory than in establishing their own. But this is always the case where both are wrong. I have as much confidence in safely wintering bees as I ever had; but well packed in such a bive as mine, with plenty of honey, will stand even such winters as the past. I believe mine would have been all right if there had been honey.
One case more and I will stop:

one case more and I will stop: In taking off the top cushions to see which bees were dead and which were not, on opening one hive I thought all were dead, but my son, who was with me, said he thought he saw some stir. We separated the combs and found some bees that could move just enough to separated the comins and found some bees that could move just enough to show they were not entirely dead. I told him I would sweeten their last mo-ments; covered them up, went to the house and melted some sugar in honey and water, cooled it to blood heat, and turned in among the bees and on the frames about a feacupfull, and covered frames about a feacupfull, and covered up the hive. At night I looked at them again and found they had licked it all up clean, and they looked up at me and said just as plain as bees could say anything, "Have you any more of that stuff? if you have, bring it on." I fed them that way three times a day until I could safely clean out the hive and put in combs of honey. They had the dysentery, were cured with honey, did not fly, and are now illling up with brood as fast as any. fast as any.

I have three rules for wintering, folow them and you are safe: 1. The colony should be fair-sized, healthy, and not very old: 2. They should have all the good healthy food they need, and not any more; 3. They should be so protected as to be at all times comfortable. Follow these rules and bid detiance

to dysentery and spring dwindling. Mendon, Mich., May 9, 1881.

(We have carefully perused the above ably written article, but can find nothing to substantiate the Doctor's theory Aside from the cases we have heretofore cited, we could easily refer to scores of others which have convinced us that, as a rule at least starvation is not the prime cause of dysentery.—Ed.]

For the American Bee Journal.

#### Bee-Keeping in Mississippi.

O. M. BLANTON.

I closed the season of 1880 with 401 colonies, left on the summer stands, after a most discouraging crop of honey; amounting only to about 14. I was discouraged and did not give the weaker colonies the necessary attention, and the result was a loss of about 50 colonies from starvation.

After uniting the weak and queenless ones, I commenced the spring with 340 colonies, in excellent condition. All the combs of the dead bees I used for storing surplus honey. I shipped Mr. Muth 25 colonies, which left me 215 to commence with. I use the Langstroth hive, so arranged as to use either 3 section

To save my extra combs from the To save my extra combs from the moths, I commenced quite a number of my hives, with the Langstroth frames in the upper story, which has paid me well in extracted honey. Brood was stored in some, but they were useful in building up others. I have now obtained 2,000 lbs, of extracted and 200 lbs of camb hence.

s, of comb honey. The season has been very encouraging until within the last 10 days, when heavy rains with low temperature pre-

heavy rains with low temperature prevented the secretion of nectar. I have all my colonies this year located in one apiary, and will test, to that number, the question of overstocking.

We have the white clover still in full bloom, which will continue until July. The "swamp woodbine," which yields an immense amount of honey, is just commencing. There is scarcely a tree an immense amount of noney, is just commencing. There is scarcely a tree or plant here but what yields more or less; even the bloom of the cottonwood trees were swarming with bees, but in

There is no necessity of preparing bees here for winter, except to furnish them with a sufficient amount of honey. Packed with chaff or hulls of cotton seed is advantageous for brood-rearing. I prefer 10 frames in the brood-chamber, as they can all be occupied by the ber, as they can all be occupied by the queen, by the use of the extractor and judicious spreading. With separators I have failed. I approve of Mr. Heddon's views in regard to them. I never use foundation more than 3% of an inch wide, extending the entire length of the top bar, and seldom have over 3 per cent. of comb unfit to pack in shipping cases. ping cases

Our greatest enemies are the red beemartin (*Tunagra œstiva*), the king-bird, or Pitcherry of the West Indies, and

Next to California, the alluvial lands of the Mississippi River will produce the greatest amount of honey, which is merely a question of time. Bee-keeping here is barely in its infancy.
Greenville, Miss., June 6, 1881.

#### Missouri Convention.

The Missouri State Bee-Keepers' Association met on the call of Mr. P. P. Collier, Vice-President of the North American Bee-Keepers' Society, and American Bee-Keepers' Society, and organized by electing Dr. F. A. Grove, of Kirksville, temporary chairman, and Wm. Doughas, of Andrain County, Secretary. A motion was made and carried that the permanent organization be deferred until Friday morning, to accommonate some expected visitors.

The next thing in order was the reports from the bees.

Wm. C. Hamilton, of Audrian, reported 87 in the fall, 54 in the spring, lost 33, increased 3.

lost 33, increased 3.

Judge S. M. Edwards reported 16 in the fall, 12 in the spring, loss 4.

P. P. Collier reported 9 in the fall, 8 in the spring, loss 1.

Dr. F. A. Grove reported 31 in the fall, 16 in the spring, loss 15.

Dr. E.C. L. Larch, of Ashland, reported 110 in the fall, 109 in the spring, loss 1.

W. A. Douglas reported 2 in the fall, 2 in the spring, no loss.

2 in the spring, no loss.

After a general talk on the various causes of mortality during the last 2 years, the Convention adjourned until Friday, June 3, at 10 a.m.

On Friday morning the Convention convened, and on motion P. P. Collier was elected President of the Missouri was elected Freshlent of the Missouri Bee-Keepers' Society; Dr. F. A. Grove, of Kirksville, Secretary; Jno. B. Sny-der, Treasurer; and Dr. George Ham-ilton, of Callaway, Corresponding Secre-

—J. S. Duncan, Browning.
—A. L. Seaval, Kansas City.
The Fresident will appoint VicePresidents for other counties.
The Committee reported a constituion and by-laws which were adouted.

tion and by-laws, which were adopted, giving as the name, "Missouri Bee Keepers' Association."

On motion the next meeting of the Association will be held at such time

Association will be held at such time and place as the President may, after consulting the bee-keepers of the State, think best to suitall parties concerned.

On motion, Dr. J. W. Greene, of Chillicothe, was elected a delegate to the National Association, with P. P. Collier and Paul Dunken as alternates.

A communication from Dr. E. C. L. Larch, on "Queen-Rearing," was read and ordered placed on tile. Also one on "In-and-in-Breeding," by P. P. Collier. On motion, it was agreed that the President and Secretary assign members various subjects for discussion at the next meeting.

On motion, the proceedings of this meeting be published in the BEE JOUR-

neeting be published in the BEE JOCK-NAL, and the Bee and Agricultural papers of the State.

On motion, the Society adjourned to meet at the time and place hereafter designated.

P. P. COLLIER, Pres.
F. A. GROVE, Sec.

The Northern Michigan Bee-Keepers' Association will hold its fourth Annual Convention at Maple Rapids, Clinton Co., Mich., October 11 and 12, David Eishelman. Pres.

O. R. GOODNO, Sec., Carson City, Mich. . . . . . .

#### CLUBBING LIST.

We supply the Weekly American Bee Journal and any of the following periodicals, for 1881, at the prices quoted in the last column of figures. The first column gives the regular price of both :

Publishers'Price. Club. The Weekly Bee Journal (T. G. Newman) ...\$2 00 and Gleanings in Bee-Culture (A.I.Root) 3 00. 2 75 Bee-Keepers' Magazine (A.J.King). 3 00. 2 60 

Bee-Keepers' Instructor (W.Thomas) 2/50... 2/35 

Bee-Culture (T.G.Newmnn)..... For Semi-monthly Bee Journal, \$1.00 less.

For Monthly Bee Journal, \$1.50 less.

#### Local Convention Directory.

Time and Place of Meeting. Sept.— National, at Lexington, Ky.
—Kentneky State, at Louisville, Ky.
Oct, 11, 12—Northern Michigan, at Maple Rapids,

HONEY.—The market for extracted clover honey good, at Scalec. Comb honey is of slow sale at lice. or the best. BEESWAX-18@22c.

#### SAN FRANCISCO.

SAN FRANCISCO.

HONEY.—Receipts this month have been exceedingly light, we might say magnifeant, verifying reports regarding a light crop. During the first three weeks of June last year about 1,500 cases were received. The market is firm, with no demand for new at this moment. There is a market difference between prices just now obtainable and the prices at which stocks are held, although a few buyers are hidding better prices on old lots. For one strught lot of old extracted 7½c, has been offered, and for the same set is staked. BEESWAX 250cHe.

We quote white come to extra white, 765c; dark and candied, sacte. BEESWAX 250cHe.

STEARN & SMITH, 423 Front Street.

San Francisco, Cal., June 18, 1881.

#### THOMAS C. NEWMAN.

EDITOR AND PROPRIETOR.

CHICAGO, HLL., JUNE 29, 1881.

#### The Care of Comb Honey.

Mr. John Crawford asks the following questions: "Will you, through the BEE JOURNAL, inform me how to take care of comb honey? What kind of a house, temperature, light or dark, dry or moist, should be used?

The following is good advice on the subject from one of our most successful comb honey producers: "Filled sections or boxes that have been removed from the hives, should be examined every few days. If the combs show signs of worms, the honey must be fumigated with sulphur. Care must be taken not to give them too much, or it will discolor the honey, giving it a greenish east. The amount used will depend, of course, on the size of the room or box you are using. It requires but very little of the fumes of sulphur to destroy life either animal or vegetable. Fumigation will not destroy the eggs, so it may be necessary to give them a second dose, after all the eggs have had time to hatch. By close watching you will be able to discover the worms before they have done any material damage. They are very small at first, but you will notice their presence by seeing a small thread-like streak of a mealy looking substance on the cappings or around the edge of the combs in the partly filled cells. Comb honey should be kept in a warm, dark place. It should never be allowed to stand where the sun will shine directly on the combs. especially when behind glass. The cappings will soften in a very few moments and settle down on the honey, giving it a dark appearance. The object should be to keep the honey as white and clean as possible all the time. Comb honey will bring 2 or 3 cents more per pound, when nice and white, than that of the same quality in soiled or discolored packages.'

This number of the Weekly BEE Journal completes the first six months of its existence. We are more than pleased with the manner in which it has been received, and the welcome everywhere accorded to it.

Several thousands have only subscribed for six months, and their subscriptions expire with this number. To all such we desire to remark that by sending on their renewal at ouce. they will not only prevent the annoyance, to themselves, of missing the regular visits of their old friend-the Weekly BEE JOURNAL, but they will save us much trouble in taking their names off from our mailing lists, and then re-entering them within a short time. We hope all will renew at once or else send us a notice, by return mail, if they desire its visits continued.

We have received from Saalfield's Music Store, 839 Broadway, N. Y., the monthly "Ten Cent Library of Music," containing 16 pages of the most popular music for 10 cents. It is astonishingly cheap, for the music is first-class.

We have received the following letters and articles clipped from Texas papers. They will explain themselves as fast as read:

DEAR EDITOR: The following article was sent me from Texas, taken from a paper of that State, on the subject of Perhaps you can give the people thern Texas some information of Southern on bee-raising, by making up an article from this little jocose piece for your JOURNAL. PORTER II. SNOW.

#### Bee-Culture in Texas.

The culture of honey making bees is a new industry which has sprung into prominence in Texas within the last few years. The magnificent bottoms of the Brazos and Colorado rivers, earpeted with thousands of wild flowers, afford magnificent ranges for the honey hee, and several farmers in that section of the State, realizing this fact, have secured swarms of wild bees and, domesticating them, made money by the experiment. Quite a number of enterprising men have given it their sole attention, finding the industry vastly more profitable than cotton-raising. To make a success out of the business a person must have a talent for domes. a person must have a talent for domesticating wild bees.

The wild bee is a small black institution, but fearfully loud, and, being chivalrous to a fault, he tilts at every enivarious to a raint, he this at every one who intrudes upon his domain. The fellow who struck Billy Patterson, hit quick and hard, but Billy seye never did look as bad as that of the man who has been boxing with a wild bee. has been boxing with a wind bee. The statement that they never sting but once, is false, as hundreds of persons who have enjoyed the fun of cutting down a bee tree will testify. The black down a bee tree will testify. The black bee skims along the surface of the ground feeding on the blossoms, but always with his rudder end in first-rate shooting order, and if there is a Sunday school picnic in the neighborhood, he will be there to participate and help on the fun. There is, no doubt, a great deal of money to be made by shipping thousands of gallons of honey to a mar thousands of gamons of noney to a market every year, but there is but little solid comfort in raising wild bees, whose only aim in life is to put a head on every mortal they get a chance at.

Mr. M. M. Camp, of Navasota, Texas, sends us the following article, also cut from a Texas paper, and adds: "Please publish and comment upon the writer's ignorance)." Here is the article:

THE BLACK BEE DEFENDED-ANTECE: DENTS AND HABITS OF THE BUSY LITTLE WORKER.

Seeing an article, some time since, eaded "Bee-Culture in Texas," I wish to defend the little black bee, which the

writer so abused.

The black bee is a native of Africa. The first discovery made of the black bee was in the year 1342. In May, 1410, The first discovery made of the mark bee was in the year 1342. In May, 1410, a small hive left the southern coast of Africa, and struck a due course for Cuba. In the same year, 1410, in the month of November, a hive of bees was found in the mountains of Cuba. was found in the mountains of Cuba. In the year 1572 the black bee was very numerous in Cuba. The next year, 1573, they nearly all emigrated in the direction of North America. The first black bee that was ever seen in America was in the swamps of Lousiana, in the year 1575. This is fair proof that this was the same bee that left Cuba. For there were several bives found in one for there were several hives found in one

Right here was the first instance we Right here was the first instance we have of the black bee being handled. He fought desperately for a few years, but careful handling proved a perfect success. From that time up to the present time the black bee has been a favorite with bee-raisers.

1 find, by experience, the black bee is worth more than any other bee. They can make more honey than any other bee, and at the same time can live on 1<sub>3</sub> less than any other bee. They are line workers, protect their hives better, and live longer. In fact, they can live and thrive where other bees will starve

them.

They will live through the winter on They will live through the winter on most anything. I feed on boiled corn, potatoes, bread, mush, turnips, pumpkins, slops from the dairy, dried apples or peaches boiled down, or old wet brown sugar mixed with dough. Anything of the above kind will keep the black bee through the winter. I have seen my loop 5 wiles from bonne, they seen my bees 5 miles from home; they are not afraid to leave home like most bees. My bees seem to know me; they will fondle around me when I am about them.

I have now on my premises 385 hives fine condition. I have got them so in fine condition. I have got them so completely under my control that all I have to do is to make gums or hives and set them up above the hives, so when a new hive comes out they go into when a new live comes out they go into a new box, gum or hive, as you are a mind to call them. Will anybody show me any other bee that will do as much? I have been handling the black bee for nearly 50 years, and I find them to pay better than any others. The black bee has, on an average, 365 bees to the hive. Each bee will make, on an average, a half nound of honey a year. So a man half pound of honey a year. So a man ean tell what he is doing. You can take at least 1/2 from them, then they will have plenty to keep through the winter. JAMES BRAKEN, M. D. winter.

Mr. J. W. Henderson also sends the same extract, and remarks as follows:

Just think of it! Prof. Cook, in his Manual" (of which we think so much) says that it takes from twenty to forty thousand bees to make a good colony—but this "M. D." asserts that it only takes 365 bees to make a good colony of his magnificent "black "stock. Let us send for Mr. Frank Benton; it is no use to try anywhere in the world to find such bees as this "M. D." has.

We thank our friends for sending us these extracts. Now that we have a flourishing Bee-Keepers' Association in Texas there is a fine opportunity to improve the Italian bees which we already have. Such progressive apiarists as Judge Andrews, Dr. Howard, Mr. M. M. Camp or Mr. F. F. Collins, will do well with the Italians, so that they may have the world."

"Just think of it"-" each bee will

thirty thousand pounds of honey from each hive!

The Doctor says he has 385 hiveswith this improved stock, and a yield of say 25,000 lbs. per colony, the Doctor millions of lbs. each year, without counting on increase, for "a man can tell what he is doing," when each bee makes a half pound of honey each year!" Prodigious results! astounding revelation!! marvelous race of

extensive practice that an "M. D." of to lay eggs; but these will always desuch erudition must command, the Doctor will soon be a millionaire, for of combs or cells they may be deposited that amount of honey alone would in. Even the eggs laid by fertile workbring a million of dollars each year! Oh! "there's millions in it-millions in but we are not fully convinced that these

Unfortunately, our "M. D." has placed the date (1410) when his favorite stock of bees were introduced into this country before America was discovered! Columbus did not land till Oct., 1492.

His race of bees must be hogs—for he to death. If my bees (the black bee, for I would not have any other kind) says he feeds them with "boiled corn, continued visits.

Black Bees and Bee-Culture in Texas. happen to be robbed too close, I feed potatoes, bread, mush, turnips, pumpkins, slops from the dairy, dried apples and peaches boiled down, or old wet brown sugar mixed with dough." Either the Doctor is writing about some kind of hogs or he is a lunatic!

Again, he says he "makes hives and sets them up above the hives so that when a new hive comes out they go into a new hire or box." What supremely ridiculous nonsense! In the "backwoods" they sometimes get things very much mixed-something like that!

A hive is a box or house where a colony of bees reside; the stand is the place where the hive is located: the family of bees is, when organized, a colony; the bees leaving the colony with a queen to form increase, is a swarm.

One man will say that he has had to feed his stands (the frame that supports the box or hive); another that his hives (or boxes) flew away to the woods! How funny it would be to see boxes flying through the air!

Another that a new hire (or box) came out of his old gum, and settled up in the top of a tree!

Another that his stands (the framework or ground under the hive) all died last winter!

How necessary it is to use proper terms in order to be correctly understood by the common reader. The Doetor's foolish use of terms should convince all of the desirability of using correct names for everything appertaining to the apiary!

We lately heard of a man ordering sash" from a supply dealer when he wanted frames: another ordered frames when he wanted section boxes, etc. Calling things by wrong names leads to endless trouble and vexation.

Test of Purity for Honey .- Mr. H. to get some of the unrivalled stock of Richey, Sing Sing, N. Y., says he has "James Braken, M. D.," and cross them made further tests with the receipt that we published some months ago, and now 40,000 or more bees to the colony, and says: "I know I have struck the keywith this "cross" they can easily "beat note. This test will not color syrup made from corn, potatoes, grapes, or any other glucose syrup, but will color make, on an average, a half pound of honey. Some kinds of honey will turn honey every year—so a man can tell darker than others, owing to the bloom what he is doing." says the Doctor! darker than others, owing to the bloom from which it is gathered." This is the "Just think of it!"-with 40,000 to recipe: "I teaspoonful of honey put 60,000 bees in a colony we shall have the | into a wine-glass, with about the same magnificent yield of from twenty to quantity of water to dissolve it; then put in a few drops of tincture of iron. This turns pure honey black."

Parthenogenesis.-W. B. makes the following inquiry: "Will the drones will have a honey crop of nearly ten from a pure Italian queen be influenced if she is mated with a black drone? Please answer in the Bee Journal." No; they will not. Huber, Dzierzon, Langstroth, Cook, Quinby, and, in fact, nearly all the learned modern bee authorities are united in this opinion. It is not even necessary that a queen With such bees, and the additional should mate with a drone to enable her velope into drones, no matter what kind ers, when hatched at all, are drones; latter have power to properly impregnate a queen.

> With this number several thousands of subscriptions expire, and we hope all will renew at once or else send us notice by return mail if they desire its

Lendon, Lake Village, Ark., propounds the following questions:

1. How can I find the queen? I often look through the hive 3 or 4 times, and

do not find her.
2. How can I prevent the moths de-

stroying my empty combs?

3. From the following description can 3. From the following description can you give me the name of the bees? They are very small—one-third smaller than the black bees—with one broad yellow band just back of the thorax, the yellow baind just back of the thorax, the balance of the body is of a dull red color. They have worked remarkably well, filling their hives three times while my blacks and Italians filled but twice; they are very cross; the queens are short and plump, and very prolific, keeping the lower story of a 10-frame Langstroth hive full of brood. I bought them from a bee-keeper that wished to quit the business. Each of them cast a swarm, which are doing well. I do not think I ever saw more bees in a hive than are in my old eolonies now, after swarming. I think they are a distinct race. I have looked carefully among my other bees, and can find none of these mixed in with them.

1. Move the hive a little to one side and place a duplicate on the stand, now carefully scan each comb and place in the duplicate, and the probabilities are that you will discover her; if not, transfer the combs back, looking earefully as you proceed.

2. Give them the sulphur treatment recommended on page 204, this number, in the article entitled "The care of comb honey.

3. We cannot name them; but think you are wrong in supposing them a distinct race.

We have received the Annual Catalogue of the Miehigan State Agricultural College, which shows a very satisfactory condition of the affairs of the College. Among the means of illustrating the various studies, it mentions " An apiary, with specimens of Italian and Syrian bees, various styles of hives and honey extractors, and other approved apparatus; also noted honey plants-shrubs, trees and herbs." Such a College should be in every State, to aid progressive and scientific work.

The Northwestern Illinois and Southwestern Wisconsin Bee-Keepers' Association will hold its next meeting Aug. 30, at Rock City. Stephenson Co., IR. JONATHAN STEWART, Sec.

#### MISCELLANEOUS.

Seasonable Advice.-Mrs. L. Harrison, in the Prairie Farmer, gives the following seasonable advice:

There is a magnificent bloom of white clover (Trifolium repens) in central Illinois, and, judging from the reports from different sections, must be general throughout the country. It is essential for the production of honey that sential for the production of noney that there should be abundant bloom of the same kind at one time, yet a flow of nectar does not always follow these re-quisites. Nature's laboratory must be in right condition to secrete sweetness from the flowers, or the honey crop will from the flowers, or the honey crop will be a failure. During the blooming of white clover, if a balmy south wind blows, following a hot night, we may al-most with certainty expect a big yield of honey while these electric conditions continue. Since the advent of June the weather has been cold and wet, so that the production of honey from white clover has been meager. Occasionally

Strange Bees, etc. — Mr. W. G. Me shine very hot, bees would do a good shine very hot, bees would do a good business. Those who have their "dishes right side up" when the flow of nectar omes will catch an abundance that are full and running over with bees re the ones that will "make hay while the sun shines.

A large increase in the number of colonies, and a big yield of surplus cannot be obtained at the same time. If those bec-keepers who let their colonies mies swarm naturally will put back all swarms that issue but the first, their apiary will then be in tine condition to store surplus. The second swarm that issues is accompanied by a virgin queen, and if the queen cells are all removed from the old colony, and it returned, it will remain, as it then has no means of

Many bees died last winter leaving hives full of comb, and if after-swarms are put into these, they will make good colonies before winter. By feeding at colonies before winter. By feeding at night, and also during cold and wet weather, the number of bees can be greatly increased.

Increase by Division. -- An exchange gives the following advice concerning the increase of colonies by dividing:

Dividing bees when properly done is a much better plan for increase than to allow them to swarm naturally. But improperly done, has been the ruination of many an apiary, for it seems almost impossible to convince some people that the state of the st ple that success depends on the strength the colonies and not numbers. better plan is to wait until the bees are making preparations to cast a swarm, and then they can be divided with ben-efit. When you find they are making ready or have queen cells capped, then divide. Take a frame of honey, bees, brood, and the queen, hang in an empty hive, fill up with frames of comb or foundation. Move the old hive to a new location, placing the new hive containing the queen on the old stand, and the work is done. Nearly all of the old bees and those in the fields at work will return to the old stand, which now contains the new hive, and make quite a colony. The young hatching bees will eolony. colony. The young naturning becomes soon fill up the old hive. The empty place from which you removed the frame of broad and the queen should be filled with a frame of comb or foundation, for if an empty frame be hung in place the bees will till it with drone comb. This work should be done in the middle of the day when the larger part of the bees are in the fields. Nothing can be done for 7 or 8 days with the old him. By that they take will have old hive. By that time they will have capped the queen cells; if the cells were capped at the time of dividing they will need looking after sooner ing they will need looking after sooner than this. The queen will batch in 15 days from an egg. When the young queens are ready to hatch, all queen cells should be removed but one; those removed can be used in nuclei previously prepared or be given to colonies divided a few days in advance of the hatching queens. If no other colonies are ready to divide, make nuclei by taking 2 or 3 frames of brood and bees from presserous colonies and to them give rosperous colonies and to them give the hatching cells. The nuclei should be made the day previous, as they will then more readily accept the cells. Young queens will hatch and become fertile while occupying these nucleus colonies, and can then be built up from other colonies or be given to divided swarms, keeping the old colony together and at work until the young queens are ready.

Success is the reward of eternal Do not neglect colonies vigilance. the combs are being built straight in the frames. See that the hives are level from side to side. Should you find that they are running the combs to one side push them back into place, if not too far gone. Otherwise cut them loose and fasten in place with sticks, in the manner of transferred combs. combs are very tender, and when filled with honey and brood are easily broken. Handle them carefully, but be sure to have them straight in the frames.—Indiana Farmer.

Curiosities of Red Clover,--Mr. C. Aldrich, in the Hamilton Freeman, gives the following curious facts on this important plant. The tardy germination of many kinds of field and flower seeds. is of frequent occurrence, and does much to perpetuate the most obnoxious weeds:

In 1879 our crops of red clover (Trifoinn protense) were very luxuriant. After the haying season it made a second growth, little inferior to the first, and the seeds of this "aftermath" fully ripened. But to the surprise of all the farmers hereabouts, the following spring (1880) found the clover dead—completely killed out! Of course this was very much of a discouragement to many of us who had just begun the cultivation of this excellent fodder plant. The causes of this mortality in the clover seemed to me to be that, after a most vigorous summer growth, we had an autumn of drouth, followed by a dry cold winter, but with little snow. This state of things killed out clover, without doubt. We all thought, however, that the seeds would germinate in the spring and make us another set of plants. But this did not occur, and in many meadows where the clover was many meadows where the clover was very profuse and thick there were bare patches of ground all summer long. During the spring of 1880 the supply of moisture was rather limited, while the summer and early autumn was unusually dry. To the surprise of most people now—after the seeds have haid root the summer and most people now—after the seeds have laid upon the ground two winters and one summer—they have germinated, and promise to make our meadows as luxurient with clover as they were in 1879 and previous years! The little plants have sprung up by millions, so thickly, in fact, that not one in a score can live. "The littest will survive," and not only heartifully illustrate the and not only beautifully illustrate the great doctrine of "natural selection. but, what is of much more practical moment, will gladden the hearts of our farmers, who were greatly disappointed in the spring of 1880, to find that their would never wake up from its winter sleep.

The Honey Crop.—The Indiana Farmer remarks that "with the use of the many improvements in bee-keeping within the last few years the honey crops of this country may be increased ten fold. And yet none need fear overproduction. Honey has become a sta-ple. The home demand and consumption is on the increase largely every year. The exportation of honey to for-eign countries has become a success, and American honey is in good demand at paying prices. The California honey crop will be quite small this year, while last season's crop is all consumed, The prospects are favorable for good prices and steady demand for all the prices and steady demand for honey that we can possibly get.

Bee-Keeping in Georgia.-Mr. Bled-Mississippi, in speaking of the soe, of Mississippi, in speaking of the different sized frames, etc., gives my ideas exactly. Most of us in the South are unable to purchase hives, etc., but are unable to purchase fives, etc., but must make them, and to make a substantial  $11^5_8 \text{x91}_8^1$  in, frame is much more likely than one  $17^7_8 \text{x91}_8$ . You must remember our boys in ante-bellum days learned no trade as a general thing, and did not learn to work. I mean, of course, those owning slaves, and we have had to scuffle around considerably to do as well as we have, and you might consider us prodigies if we could make and use tools well now, having never been accustomed to it in our younger days. I wish we might have been let days. I wish we hight have been let down easily instead of jerking the props from under, so suddenly. But we are all natural philosophers, and make the best of things as we find them, taking things easy. And "if we cannot be easy we are as easy as we can be." Again, my experience in leaving be. Again, my experience in leaving on the eap during winter is like that of

Bledsoe, I had a fine Italian queen, purchased of Dr. J. P. H. Brown, of Augusta, that I would probably have lost, as the bottom combs molded and moved everything up into the and saved her little family, and they have built more comb and stored more have built more comb and stored more honey than any I have this season, and are still in it. Industry is gradually spreading over our section, and many are inquiring about the improved sys-tem of bee-keeping, and making prep-arations to give their bees better quar-ters than the old box gum. Many will neglect to attend to them, I know, and but few will realize any considerable but few will realize any considerable profit from their keeping. But bees pay well here, even in the old gum, if we could keep them from dying out, from over swarming, loss of queens, etc. 1 sell, here at home, extracted 8½ cents, comb 12½ cents. I have to compete with the box gum men, and as they will sell at any price—7 cents is what they get for comb honey now—1 think I am doing pretty well to get 12½ cts. I am not offering any more comb, however. It pays me well on the investment at 12½ cents, as I have a good location. ment at 1223 eents, as 1 have a good lo-cation for bees, and only keep as many as 1 can attend without interfering with the work of the farm. I caught the "idea" from your issue of June 1; had it already from the pen of Mr. Doolittle in the JOURNAL for 1880, but had negleeted to remember. I am well pleased with the JOURNAL in any shape, but would prefer it something like the Bee JOURNAL for 1880. Capt. Milt. McCoy and Dr. Bragden, Chillicothe, Ohio, made us a tour of inspection a few weeks since, and have induced some to try clover. If successful it will revolutionize fewing mad her breaking. ize farming and bee-keeping. J. B. Russell.

Culhbert, Ga., June 20, 1881.

Bee Stings.—I have found the immediate application of common salt to the place stung to be very effective in neutralizing the poison, and allaying the pain, both in my own case and in others to whom I have given the remedy, so that I feel no inconvenience. Lusii ally earry a lump of salt, and place it near for immediate use. Perhaps it may not prove as efficient in giving relief to others, but it is a convenient remedy when effective. My bees were late in getting down to their work, but they are doing well now. I have had no swarms yet, and very little indica-tions of any preparations that way, but tions of any preparations that way, but yesterday I found them preparing queen cells and hatching drones. One swarm became queenless, and I found a queen capped in a frame well filled with capped brood, and placed it with them, but they tore down the cell. I then found a frame containing capped and uncapped brood and eggs in nearly every cell and placed that with them; yesterday I found them constructing a queen cell—how it will come out I cannot tell. I have given them several frames of brood from hives that could spare them. They are storing honey freely.

1. B. WALKER. St. Johns, Mich., June 22, 1881.

Good Prospect for Honey .my bees (23 colonies) last winter; over  $\hat{z}_3$  of all the bees in this locality died; but I am commencing again. doing well now on clover; the prospect is tine for a good crop of honey.

T. P. Barnum.

Carlton, Mich., June 23, 1881.

The True Cause of Winter Losses of Bees.—It is amusing to hear the reasons given by bee-keepers of the different eauses of bees dying in winter—some giving one reason and some another. In my opinion, nine-tenths of all the bees that died last winter died from being confined so long without a chance to fly. I am more than pleased with the Weekly Bee Journal—cannot wait for a monthly in these times.

F. L. Merrick.
Kankakee, Dl., June 23, 1881.

Bees Doing Well,-The loss of bees last winter was fearful in this locality. They are doing well now, gathering honey fast, and swarming freely.

A. STEWART. Rock City, Ill., June 24, 1881.

The Honey Yield .- Our honey crop is being cut short by reason of the unfavorable weather—cold and stormy. The orable weather—cold and stormy. The first swarming occurred here on the 10th and 11th inst., which is earlier than usual. During the last 2 weeks it has rained much of the time, with some hail, cold nights, and no warm days. The locust is going out of bloom, and the yield from that source has been very scant. The yield of honey from the berry bloom was very limited. The white clover has been in bloom? weeks white clover has been in bloom 2 weeks, but it does not yield much nectar; consequently the honey season will be of short duration. We can now only depend on the clover, while yet it continues, and basswood and buckwheat. At present the outlook bodes a short supply of honey. I have just received from Mr. C. H. Lake photographs of his bee hive in working order. The hive is dehive in working order. The hive is designed to prove a life-saving tenement for bees wintered on the summer stands. It is a Langstroth hive, having dead-air chambers on all sides and bottom. Dead-air chambers are away ahead of any sort of packing as a protection against the vicissitudes of irregular temperature. C. J. Robinson. Richford, N. Y., June 18, 1881.

Sour Honey not good for Winter Food.

—Out of 45 colonies of black bees last
November I had but 15 very weak ones
on May I, which are now getting in
working order. My hives are one foot
square inside, and 22 inches long; I use
division boards, and winter on the summer stands without protection, except
blankets. I attribute the loss to a poor
season last year when they gathered blankets. I attribute the loss to a poor season last year, when they gathered some sour, unhealthy honey; there was some uncapped honey in the lower part of the frames last fall, and some of it is there this spring; the capped honey is all gone.

F. BAKER.

The Mark Might Impact 1881 all gone. F. Holly, Mich., June 20, 1881.

Fertile Workers,—Is there such a thing as a fertile worker—a bee with the pre-requisites to lay eggs, carry pollen and store honey? Please answer in the BEE JOURNAL.
Shellrock, Iowa, June 20, 1881.

[Yes, there are fertile workers. We have had two sent us which were captured in the act of depositing eggs. They were dead when received, but from their physical structure we would imagine they were possessed of all the instincts and attributes of the ordinary worker bees.—Ed.]

Bees building up now.—About 75 per cent. of the bees in Jersey county died last winter. Those that lived through last winter. are doing well, building up, and gathering honey very fast. I have been ering honey very fast. I have been considerably interested in reading the JOURNAL, to see in what hive bees have wintered on the summer stands best, as that is the hive we want in this latitude. Armstsong's Centennial hive has been the best here, some losing all their bees in the other hives and saving most of them in the Armstrong. The Weekly BEE JOURNAL is just what we want; I do not see how we could have want; I do not see how we could have done without it so long. Monthlies are in style no longer. H. D. EDWARDS. Delhi, Ills., June 21, 1881.

Wintered Well.-Bees in this section wintered well; they are generally kept in cellars. I put 43 colonies in the cel-In cellars. I put 43 colomes in the cellar, one died in the cellar and 3 after I put them out; 3 were queenless and one was robbed. One man put 70 in a cellar and set them all out alive; and cellar and set them all out anve; and another put 38 in a cellar and all came out alive. I have had 17 swarms; my bees have not commenced to work in boxes yet. It has been too cold and dry for honey here. I cannot do without the BEE JOURNAL as long as I keep bees.

E. F. TAYLOR.

Canton, N. Y., June 20, 1881.

Good Honey Yield.—Our bees are storing honey very fast. It has been a poor year for swarms, but, so far, the bees have stored 60 lbs. of box honey per hive, which we consider good.

BRAY & SEACORD.
Warthan, Cal., June 11, 1881.

tood Yield of Honey Expected.—The loss of bees is great in this county, as well as elsewhere; a few have wintered without loss, on the summer stands, packed with chaff. I have 30 weak colonies out of 50 last fall. They are filling up fast now, and the season bids fair to be a good one. We have hed plenty of be a good one. We have had plenty of rain lately. W. H. S. GROUT. Kennedy, N. Y., June 16, 1881.

Bees in Muskoka, Canada.—I commenced last spring with one colony of bees, very weak, and increased to 2, by natural swarming in August. The swarm did not gather quite enough for wintering, so I fed granulated sugar syrup, as directed by Mr. D. A. Jones; syrup, as directed by Mr. D. A. Jones; I packed them in chaff and straw about the 1st of Nov., on the summer stands, 18 inches all around the hives, with the upper story filled with chaff; they had no flight from Nov. 5 till March 15; it was very cold at times, twice it was down to 40° below zero; the old colony showed signs of dysentery. I think, from having an excess of pallen: the showed signs of dysentery, I think, from having an excess of pollen; the swarm fed with sugar syrup showed very little dysentery, in fact, it came out as strong as the parent colony. About 30 per cent. of the bees have died in this district; ½ in bee-houses and ½ on summer stands. Can a weak colony of Italians be safely united with hybrids for wintering? The frame I use measures 11½ inches wide by 13½ inches deep, 10 frames to a hive, with a half story for surplus. The Weekly BEE JOURNAL has become a necessity with us.

ROBERT II. SMITH.
Falkenburg, Ont., June 15, 1881. Falkenburg, Ont., June 15, 1881.

[Yes; you can safely unite hybrids and Italians for wintering.—Ed.1

Wintered on Summer Stands.—I wintered 16 colonies on the summer stands with a loss of one up to April 7; after that I lost 3 more which had queens but no brood and one had no honey until I supplied it with some reserved frames of capped honey. My bees have not done very well this spring on account of the cold wet weather, but now they are working nicely. Since reading in the Bee Journal for June 15 of the proposed change of size of the pages for next year, 1, for one, will say that I shall be much better pleased with it, and you may consider me a subscriber for 1882. F. H. SEARES. Girard, Pa., June 19, 1881.

Bees in the Highway, etc., a Nnisance.

A man kept a colony of bees by the fence of a public highway; mischievous and ugly boys stoned the bees until ous and ugly boys stoned the bees until they caught the malady and immedi-ately took possession of the highway, and warned people very quietly for sev-eral days not to pass that way. My brother, not knowing of the blockade, undertook to return home that way from town; the insulted bees halted him and stung him and his horse; the borse unset the carriage and demolished him and stung him and his horse; the horse upset the carriage and demolished things generally. The overseer of high-ways ordered the bees removed, and was coolly told to do it himself. That was coolly told to do it himself. That night a load of straw was seen approaching the innocents; a bonfire lit up the firmament; in the morning a black and charred spot told where a "black and cruel deed" had been done by one that believed that bees in the highway were a nuisance. Neighbor S., living in an old house, had a large swarm of little, black, sharp-pointed bees move in and locate in about the center of the house, between the floor and ceiling; the floor being open and the ceiling cracked, the coolly told to do it himself. being open and the ceiling cracked, the bees left the clusters in all directions; the 2 families quarreled. Mr. S. de-clared a war of extermination; the bees accepted the challenge. Mr. S. murdered them by the thousands without mercy, with fire and sword, brimstone and smoke. The bees used their spear and bag of poison until they blackened and closed the eyes of Mr. S. and drove him and his wife and children into a little corner bed-room that hanvened to be been proof.

as they could occupy, but the slaughter had been too great; before they could rear their brood (21 days) they dwindled to a mere handful and perished, and neighbor S., after a week's confinement, declared bees to be a nuisance. I have 29 colonies of bees, doing well. I lost 7 colonies last winter out of 35; 2 or 3 were queenless; the mice killed I. or 3 were queenless; the mice killed 1, and 2 or 3 died of dysentery; 5 or 6 and 2 or 3 died of dysentery; 5 or 6 were sick and weak after 6 month's confinement, and one had a drone-laying queen. I had a nice swarm come to me about a week ago. Bees are swarming earlier than usual; nearly all my bees are storing in section boxes.

ALYAH REYNOLDS.

Oneida, Ill., June 11, 1881.

Old Queens. -Old combs can be nicely

cleaned by pouring water over them and throwing it out with the extractor; pare off the moldy part with a knife. I have hived 5 swarms this week on old combs treated thus, and bees go to work immediately, carrying out the soured pollen in bulk, and dragging out the dried dead bees in a hurry. Of the 5 swarms, only 1 queen could fly; is it a sign of old queens, or what is the cause?

Peter James.

PETER JAMES. Waveland, Ind., June 18, 1881.

[Frequently queens that have been pushed to their utmost ability in breeding, become too enfeebled to fly at the first attempt. Yours may, however, have been incapacitated from old age or defective wings.—ED.]

Swarming.—My bees commenced to swarm on May 20, and by June 1 I had 20 swarms; by June 19 1 had 26 more, and have only lost 3 of them; one hung out all night and went off in the morning; another did not cluster and went off before all left the hive, and nearly off before all left the hive, and nearly half of them returned to the hive (an unusual occurrence); the other became mixed up with another swarm, and when hived they could not all get in and that swarm left. We have a fair crop of honey from the basswood, but have had too much rain. I had 40 colonies of bees to commence with; I have sold 5 and have 85 left. There is a good prospect for honey. sold 5 and move prospect for honey.

John Boerstler.

Gilead, Ill., June 22, 1881.

A Chapter of Experience.—I bought my first colony of Italian bees of Mr. Heddon in 1879. They were of the dark, leather-colored variety. Since then I have bonght queens and bees of Roop, Valentine, and others, but the finest queen I ever saw I got from D. A. Pike. I reared queens from her and they were as handsome and light colored as their mother; the drones were large and almost as yellow as the workers, and the oneens are very proworkers, and the queens are very pro-lific. I bought 5 colonies of Italian bees of H. A. Burch & Co., in 1880; they arrived about a month later than they were to have been sent; 2 were hybrids and 3 black. I have since Italianized them, as I want nothing but pure stock in my apiary. With the Weekly BEE JOURNAL I am well pleased.

D. P. CAMPBELL.
Park Hill Out

Park Hill, Ont.

Upper Ventilation.—Out of my 50 colonies last fall only 7 lived through; 8 that were packed all died. Those that lived and were in the best condition had lived and were in the best condition non upper and lower ventilation and were all on the summer stands. M. had 16, in box and cottage hives; all died. T. H. had 13, in box hives; all living; a strong one had a bole in the top, with an empty hive on for surplus. H. has a many transfer fall. strong one had a hole in the top, with an empty hive on for surplus. It. has 7 alive; he only had a few last fall (I do not know how many). His hives stand on nails or blocks and have holes in the head (with caps) for passages. None of these bees were packed—all remained on the summer stands except the 8 I packed which died. I believe in upper ventilation; bees cannot get apough air through wicking only for a dren into a little corner bed-room that the 8 I packed which died. I believe happened to be bee-proof. After 2 or 3 in upper ventilation; bees cannot get days of fearful carnage they sent for the bee tamer. I found about 2 quarts of bees clustered on 2 small pieces of comb, ready and willing for war. I treated them kindly, gave them all the honey they wanted, invited them into a nice house with a smany hexagon rooms in the spring which was on the product of the provided distribution. The stream of the

with room enough for a full grown rabbit to enter with ease; the top was an old barrel head, laid on in two pieces, an old barrel head, laid on in two pieces, lacking nearly an inch of meeting, with a rough board over the space. Besides this, between the head and hive, for 14 of the way around, was nearly 34 inches space between. The mercury last winter was 120 below zero here, and the above is what I call upper and lower ventilation. I transferred the bees from the box hive (which was about 3 feet high and 11 inches square) about from the box five (which was about a feet high and 11 inches square) about swarming time. I had only 2 frames of brood 12 inches square and was a medium colony, showing that the queen was not worth much. There was no appearance of dysentery and but little honey.

Big River Mills, Mo., June 13, 1881.

Good, for a Beginner.—In April, 1879, I bought one colony of Italians from G. M. Hawley, and increased to 2; in 1880 I increased to 4; wintered on the summer stands, packed all with straw, expert in the stands. cept in front, where I hung a piece of rag carpet. They all came out good and strong in the spring. I have increased to s this summer. Prosperity to the Weekly BEE JOURNAL.
G. W. GORUM.
Bennet, Neb., June 19, 1881.

The Enlargement of the Bee Journal. -Dear Editor: I am exceedingly glad that you will make the improvements and enlarge the Bee Journal giad that you will make the improvements and enlarge the Bee Journal next year. It is very gratifying to know that this year's experiment of publishing a Weekly Bee Journal has been sufficiently encouraging to you to give us so long in advance the promise of doubling the number of pages and improving the size of the leaves, so as to be more convenient for binding and preserving. Though I have been very much pleased with its weekly visits, I must say that I have not quite liked the inconvenient size of the pages; but as I felt sure you would improve that as fast as you felt warranted in doing so, I have not said anything about the inconvenient shape, and hall with joy the promise of the improved Bee Journal for ISS2. You can count on me for a subscriber, for I must have it as long as I keep bees.

JOSHUA HILLS.
Granby, Minn., June 29, 1881. 1 keep bees. Joshua I Granby, Minn., June 20, 1881.

Cellar Ventilation, etc.—My loss in wintering was 1 out of 7. They were packed in tiers 2 hives deep and about 6 inches apart, with straw between them and about 3 feet of straw at the back. They were facing the south. There is They were facing the south. There is a good prospect for a fine linden harvest in this locality, 1. What is the best plan for ventilating a cellar, size 12x20 feet? 2. The little black ants are crawling all through my hives; how can I keep them out?

A they Hill Loya Loya 14 1881 Arbor Hill, Iowa, June 14, 1881.

[Run a 6-inch drain-pipe from the the outside into the cellar. This should, if possible, run through the earth outside and make the connection with the cellar near the bottom. Another pipe should connect the cellar with a chimey-tlue or stove-pipe. These pipes should both be arranged with dampers, so the temperature of the cellar can be regulated.

2. Various methods have been suggested, but we know of nothing more effectual than to put the hives on stands having legs, and let these rest in vessels (fruit cans with the covers trimmed off will answer) partly filled with crude petroleum or diluted sulphuric acid.—ED.1

The Clover, etc.—There is very little The Clover, etc.—There is very little honey from white clover as yet, although the bloom is magnificent; it is too cool and wet. Basswood is in bloom; nearly half of the buds are open. Although there were hardly enough bees left for seed, in this locality, we have heard of several runaway swarms. One clustered on the lamp-post at the corner of one of the principal streets. Bee-hunters that had marked colonies in trees last fall, and did not take them up because they and did not take them up because they had so little honey, report them dead this spring.

MRS. L. HARRISON. this spring. Mrs. L. H Peoria, Ill., June 22, 1881.

#### SPECIAL NOTICES.

Single copies of the JOURNAL are

sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

When changing a postoffice address, mention the old address as well as the new one.

The Volume of the Bee Journal for 1880, bound in stiff paper covers, will be sent by mail, for \$1.50.

🖲 We have prepared Ribbon Badges for bee-keepers, on which are printed a large bee in gold. Price 10 cents each, or \$8.00 per hundred.

Notices and advertisements intended for the Weekly Bee Journal must reach this office by Friday of the week previous.

Many Lose Their Beauty from the many Lose Their Beamy from the hair falling or fading. Parker's Hair Balsam supplies necessary nourishment, prevents falling and grayness and is an elegant dressing.

Constitutions and By-Laws for local Associations \$2 per 100. The name of the Association printed in the blanks for 50 goats extend

We can supply but a few more of the back numbers to new subscribers. If any want them, they must be sent for

Instead of sending silver money in letters, procure 1, 2 or 3 cent stamps. We can use them, and it is safer to send such than silver.

Sample copies of the Weekly BEE JOURNAL will be sent free to any names that may be sent in. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this collect. names to this office.

The date following the name on the wrapper label of this paper indicates the time to which you have paid. In making remittances, always send by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, and local checks, are not taken by the banks in this city except at a discount of 25c., to pay expense of collecting them.

Premiums.—For a club of 2, weekly Premiums.—For a club of 2, weekly we will give a copy of "Bee-Culture;" for a club of 5, weekly, we will give a copy of "Cook's Manual," bound in cloth; for a club of 6, we give a copy of the Journal, for a year free. Do not forget that it will pay to devote a few hours to the Bee Journal.

😭 At the Chicago meeting of the National Society we were requested to get photographs of the leading apiarists, to sell to those who wanted them. We can now supply the following at 25 cents each: Dzierzon, the Baron of Berlepsch, and Langstroth. The likeness of Mr. Langstroth we have copied, is one furnished by his daughter, who says furnished by his daughter, who says, "it is the only one ever taken when he was in good health and spirits." We are glad to be able to secure one of such a satisfactory nature.

to lt would save us much trouble, if We It would save us much trouble, if all would be particular to give their P.O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name. Many others having no Postoffice, County or State. Also, if you live near one postoffice and get your main at another, be sure to give the address we have on our list. dress we have on our list.

An Old Lady writes us: "I am 65 years old and was feeble and nervous all the time, when I bought a bottle of Parker's Ginger Tonic. I have used a little more than one bottle and feel as at 30, and am sure that hundreds need just such medicine." See advertisement

LIFE and ADVENTURES of ROBINSON CRUSOE.
This well-known book may be ranked as the most popular standard juvenile book ever printed. Our edition is complete, and contains the wonderful adventures of a cast-away upon a desert island. Complete in one vol. Fully illustrated.

THE PILGRIMS PROGRESS
From this world to that which is to come. This remarkable book, as every one knows, was written under the similitude of a dream, by John Rocker the public religious writer in the More of the met to the public religious writer in the More of the met to the public religious writer in the More of the met to the public religious writer in the More of the met to the public religious writer in the More of the met to the met to

island. Complete in one vol. Fully illustrated. THE PILGRIMS PROGRESS
From this world to that which is to come. This remarkable book, as every one knows, was written under the similitude of a dream, by John Ennyan, the most popular religious writer in the English language; and perhaps more copies have been sold than any other book except the Bible. Our edition is complete and unabridged, with appropriate illustrations.

propriate illustrations.
GULLIVER'S TRAVELS.

GULLIVER'S THAVELS.

This book tells of the supposed travels and surprising adventures of Lemiel Gulliver into several remote regions of the world, where he met with a race of people no larger than your hand. Also his wonderful exploits among gunts. Complete in one volume. Finely illustrated.

THE ARABIAN NIGHTS' ENTERTAINMENTS.

Illustrated with numerous wand engraines do.

HE ARABIAN NIGHTS ENTERTAINMENTS.

Illustrated with numerous wood engravings, descriptive of those many strange and singular stories which the legend says the Sultaness of Peesis related to the Sultan night after night, in order to prolong her life, and tous finally won his affections and delivered the many virgins, who but for her would have been sacrificed to his unjust resentment.

SAVED AT LAST FROM AMONG THE MORMONS Every man and woman in the land should read this story which is bounded upon facts, and gives an insight into the low estate of woman under

BREAD AND CHEESE AND KISSES.

READ AND CHEESE AND KISSES.

By B. L. Farjeon. A very popular Christmas story after the style of Dickens; abounds in excellent and novel features; is chiefly remarkable for its admirable picture of country life, giving the history of a very happy and contented voing couple who thought no lot in life too lowly for the pure enjoyment of Bread and Cheese and Kisses. Complete in one volume, with illustrations.

A history and description of noble deeds, present-ing correct and heautifut models of noble life to awaken the impulse to imitate what we admire. By the recorded actions of the great and good we regulate our own course, and steer, star-guided, over life's trackless ocean. Complete in one volume, with illustrations.

I over life's trackless ocean.

The usual price of these books bound in cloth is \$1.00 to \$3.00 each. We propose to bind them in heavy paper or thin eard board, and send them by mail and prepay the postage, for 25 cents each. They comprise a wide range and striking diversity of the most brilliant and pleasing productions of the most noted and popular authors, and include books of travels, adventures, fiction and humor, so that all tasts will be suited. We propose to call it the FARM AND FIRESIDE LIBRARY, and say one obtaining these ten looks will possess a bitpary of ten of the most popular books ever published. We have not room to give a full description of each book, but all will be delighted wbo obtain these noted books at so low a price.

THE HOOKS will be the latest and most complete editions, and will contain many illustrations, one alone requiring thirty-nine pictures to complete it.

THE PAGES are about 5½ by 8 inches—the most convenient size for reading and preservation.

THE TYPE is Minion, easy on the eyes. THE PAPER is beavy and of a beautiful white color.

THE FIRST BOOK. Robinson Crusoe, was ready about April 1st. One of the others will follow

containing a great number of pictures.

NEW FARM AND FIRESIDE COOK SOOK.

BESTCOOK BOOK EVER PUBLISHED. Contains about 1,000 Recipes. It is just the book that every wife and housekeeper needs. It tells how to cook all kinds of bread, cakes and meats; it tells how to make all kinds of soup; it gives recipes for cooking fish, oysters, poultry and game; it tells how to select the best poultry, fish, meats, etc.; it gives the best methods of preparing sauces and salads and all kinds of vegetables for the table; and tells the housekeeper all she needs to know shout bread, bisenits, rolls, puddings, pies, custards, creams, cookies, tea, coftee, chorolate, home-made candles, antidote for poison, cooking for the sick, and many other useful things.

ESOP'S FABLES.

The rabies of, Esopus, an apt representative of the great so cal and intellectual movement of the ave which he adorned. Born a slave, he forced nia way by his mother-wit into the courts of princes. He knew that to be tolerated in courts he must speak to please, and he gave lessons both to prince and people by recitals of fables, which were very popular in Athens during the most brilliant period of its literary history; and he who had not Æsop's Fables at his finger's ends was looked upon as an illiterate dunce by Athenian gentlemen. In one vol. Very profusely illustrated.

NOBLE DEEDS OF MEN AND WOMEN.

DESCRIPTION, -Sec. 4. township 7, south range 7 west, Franklin county. Florida, standard about 50 miles south of the Georgia line, 25 miles west of the city of Tallahasse, the capital of the State, and about 25 miles northeast of the city of Apalachicola, a seaport on the Gulf of Mexico, and within 2 sections (5 and 6) of the Apalachicola river; the soil is a rich, sandy loam, covered with timber.

It was conveyed on bec. 3lst, 1875, by Col. Alexander McDonald, who owned 8 sections, including the above, to J. M. Murphy, for \$3,300, and on Sept. 5th. 1877, by him conveyed to the undersigned for \$5,000. The title is perfect, and it is unmembered, as shown by an abstract from the tecords of the county, dip and the receipts are in a labagain for cash, or trade to the standard of the county for a small farm, or other desirable property. An offer for it is respectfully solicited. Address,

THOMAS G. NEWMAN.

the Amary, enlarged and elegantly illustrated. the Aparry, enlarged and elegantly illustrated. The list edition of 3,000 copies was exhausted in about 1s months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various

manipulations necessary in the apiary. This work is a masterly production, and one that This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and the resulting little extension. interesting and thoroughly practical.

> -:0:-Read the following opinions of the Book;

All agree that it is the work of a master and of real value.—L'Apiculture, Paris.

1 think Cook's Mannal is the best of our American works.—LEWIS T. COLDY.

It appears to have cut the ground from under tuture book makers.—British Bre Journal.

tuture book makers.—British Bee Journal.

Is a masterly production, and one that no beekeeper, however limited his means, can afford to
do without.—Nebraska Farmer.

Prof. Cook's valuable Manual has been my conspant guide in my operations and successful management of the aplary.—J. P. WEST.

agement of the apiary.—J. P. WEST.

I have derived more practical knowledge from
Prof. Cook's New Mannal of the Apiary than from
any other book.—E. H. WYNKOOP.

This book is just what everyone interested in
bees ought to bave, and which, no one who obtains
it, will over regret have upichased.—Mich. Far.
To all who wish to engage in bee-culture, a
mannal is a necessity. Prof. Cook's Manual is an
exhaustive work.—Herald, Monticello, Ill.

My success has been so great as to almost astonish myself, and much of it is due to the clear, distinterested information contained in Cook's Mannal—WM, VAN ANTWERP, M. D.

interested intermitation contained in Cook's Manial—WM. VAN ANTWERP, M. D.

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welcome, and it is essential to every amateur in bee-culture. It is handsomely printed, nearly bound, and is a credit to the West.—Western Agriculturist.

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. Thore is no subject relating to the culture of bees left intouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowlede of apiarists, which he uses admirably to promote and make popular this most interesting of all occupations.—American Inventor. It is the latest book on the bee, and treats of both the bee and haves, with their implements. It is of value to all bee-raisers—Ky Live Stock Record.

With Cook's Manual Lom more than pleased, it is fully up with the times in every particular. The richest reward awaits its author.—A. E. WENZEL.

It is a credit to the author as well the publisher. I have never yet met with a work, either French or toreign, which I like so much—I/ABBE DT BOIS, editor of the Bulletin D' Apiculteur, France.

It not only gives the natural history of these industrious insects, but also a thorough, practical, practical practic

Bots, editor of the Bulletin D'Apiculteur, France, It not only gives the natural history of these in-dustrions insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended necount of the enemies of bees.—Democrat, Pulaski, N. Y.

producing plants, and an extended necount of the enomes of bees. Pemocrat, Pulaski, N. Y.

We have perused with grout pleusure this voide mecans of the lose-keeper. It is replete with the best information on everything with the production of the lose-keeper. It is replete with the best information on everything to this subject, we say, obtain this valued work, read it carefully and practice as advised.—Agriculturist, Quebec.

It may safely be pronounced the most complete and comprehensive of the several manuals which have recently appeared on the subject of these with the prints of the production of the subject of the sunding of management, extending to the smallest details are all of tigh and practical value. Prof. Cook has presented the latest phases of progressive bee-keeping, and writes of the themes discussed in the light of his own experience.—Pacific Rural.

Of the many excellent works which we have examined on bee-culture, we consider Prof. Cook's the most valuable for the study of those who contemplate going into the business or are already keeping bees. It Boronghly studied, and its teachings conformed to, by the apiarist, who exercises a reasonable degree of common sonse, the or she cannot find to achieve at least a reasonable degree of success. The author ad tresses himself to the work with a degree of enhusiason which carries the same high rank, that is accorded in terminal the same high rank, that is accorded in terminal the same high rank, that is accorded in terminal.

the reader with him to the end. Kinisas Firmur, Cook's Maninat of the Aprary holds in America the same high rank, that is accorded in Germany to the hook of which Dzierzon is the author; the only difference being that Prof. Cook's Manina combines the profoundness of the German pastor with the superfority of the practical American He refers in several instances to Darwin; and does not belong to that class which hates everything that is foreign, for he speaks of German marilists with great reverence. German Freidenker Milwankee, Wis.

My Management of Bees.

P. LOUCKS.

I have handled bees some 18 or 20 years on a small scale, but have not made bee-keeping my entire business until this year. I have read 3 editions of Quinby's bee book, several of the

ing here I wanted either blacks or pure Italians (no hybrids for me), and as the country was stocked with the black or brown bee, I concluded they were good enough for me, considered in the light of former experience.

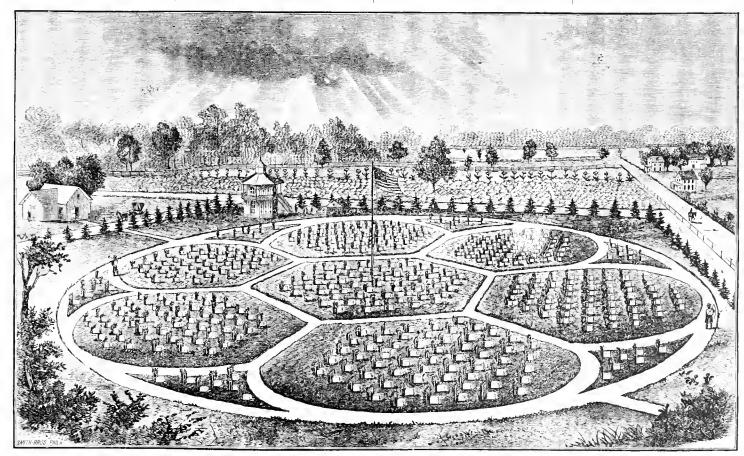

For a hive, I wanted something cheap, simple, and practical, so concluded to adopt the following: inside measure 14½x18x10 inches, holding 10 frames, a little shorter than the Quiuby frame (because I did not have the exact dimensions), bottom-board nailed on, and projecting 2 inches in front; the honey-board is made of ½-inch lumber, with six 1½ inch holes. I put a moulding all around ½ inch below the top of the hive for the cap to rest

crawl from the ground to the entrance without difficulty. The upper story is made the same as the lower story, ex-cept minus the bottom-board and the

entrances.

The main part of my stock, to start with, I transferred from bee-trees. In 1879 and 1880 I transferred and worked some bees on shares; but now I have all the bees of my own that I want to all the bees of my own that I want to handle. I had my leg broken the 12th of March, so cannot give my bees the attention necessary to get the most out of them. I have my brother-in-law doing the best he can, but he is a raw hand at the business. Swarming season is at hand. The doctor says he will have me out on crutches the last

contine them to the hive 24 hours. I rear as good queens in this way as I can wish for. When I remove the queen to a new colony I replace her with a sealed queen cell, if such are at hand. I thus keep them occupied reuring queens and building comb, and in the fall or latter part of the honey season they generally furnish some surplus honey. At the end of the season after taking out all the queens but one, I remove the partition boards and let them unite, making a good colony. Last fall I left 2 queens in one such nucleus hive, after taking out one queen and removing one division-board; in January took away the queen from the double confine them to the hive 24 hours. took away the queen from the double

A Picturesque Apiary, Designed by Mr. A. I. Root, of Medina, Ohio.

bee periodicals, etc., so I have had the-ory and practical experience.

I first made box hives as recom-mended by Quinby; after a few years I transferred to the Langstroth trame, using hives of different patterns— Novice's simplicity, A. H. Hart's complicated patent hive, and a hive of my own make, with loose bottom-board, honey-board, and cap to cover boxes, but no portico.

boxes, but no portico.

I also caught the Italian bee fever,

which lasted for several years.
On selling out to move to California 1 had one pure Italian colony out of 23; the rest were hybrids. This experience was in Outagamie County, Wis. When I commenced bee-keep-

on; cap 8 inches high. For entrances I cut out of the front end 2 places at the bottom, \( \frac{3}{8}\)x 3 inches, and bore a stand, I take 6-inch fencing, cut two pieces 16 and two 20 inches long, nailing the short pieces against the ends of the long ones. I slip the front end thickness of the bottom-board of the hive, the back end I raise one inch or more to give the required pitch forward when the hive is placed on the stand, so the bottom of the hive rests, on the side pieces. The front end of the stand serves to keep the hive from sliding forward, also to enable the bees that fall short of the each apartment the same way, then the live is placed on the stand, so the bottom of the hive rests on the stand, so the bottom of the hive rests the stand serves to keep the hive from sliding forward, also to enable the each apartment the same way, then the live is placed in the bees from one or two more combs, the stand serves to keep the hive from sliding forward, also to enable the each apartment the same way, then the live is placed in the bees from one or two more combs, the same way, then the live is placed in the first of next; then intending to remove the other division-board, but did not get around to do it for about 2 weeks, when I found and one side, to accommodate and one side, to accommodate and one side, to accommodate to accommodate they had reared a good-looking queen. So I left her, to see what she would amount to. I examined then one week. Feb. 27 I failed to discover any week. Feb. 27 I failed to discover any legs, but she must have commenced to law they had reared a good-looking queen. So I left her, to see what she would and an one they had reared a good-looking queen. So I left her, to see what she would and one side, to accommodate to look and a few legs, but she must have commenced to law week. Feb. 27 I failed to discover any legs, but she must have commenced to law week. Feb. 27 I failed to discover any legs, but she must have commenced to law week. Feb. 27 I failed to discover any legs, bu

to "spread" herself, to see what a queen hatched in January and fertilized in February will be able to do.

1 divide for increase, making one colony from 5 old ones as often as I think advisable. I never saw queens "spread" themselves before like some

"spread" themselves before like some of mine did last year in April, and in May nearly every cell in the lower story, and the greater share of the second story was filled with brood, and the third story with honey.

About 35 feet from where I lie in front of a window, there are 3 colonies of bees, the weather being warm enough to raise the window I have a good view of them. They are going in and out so fast and eager that one might think they had found a white clover patch. I was in hopes of being able to hand in a report next November that would astonish the "natives," ber that would astonish the "natives," but a broken leg, no hives to speak of or lumber to make any on hand, on account of looking up and moving to account of looking up and moving to a new range, obliged to move on ac-count of our health, have disappointed me. Let me say to Mr. Hohenshell that if he wants to shake his boots off he can come and take the place I am now on. I do not mean to say but he can find some other range where it is healthy.

I am experimenting with bees in several localities this year, having 9 colonies in the Sierra foot-hills, 9 more on the San Joaquin river, the balance I am moving some 20 miles down King's river, where they claim to have good health. Now, for the benefit of those who doubt my statements, I will say that I keep an exact account of all I do, and can vouch for what

For the American Bee Journal.

#### When are Bees a Nuisance?

JAMES HEDDON.

I must, through the BEE JOURNAL, thank a host of bee-keeping friends who have, in private communications, answered my question as to whether answered my question as to whether bees are a missance, and under what conditions? From a host of evidence and opinions of able thinkers. I have made up my mind in regard to the matter. "If bees are kept and treated in such manner that they fly at and sting people or animals then they become a nuisance, from their location." come a nuisance, from their location. This was the decision of Gen. May, City Attorney for Kalamazoo, I am informed.

In my own case, the bees were kept In my own case, the bees were kept as follows: From 100 to 200 colonies were located upon two city lots, forming a square eight rods each way. This square was surrounded by a picket fence; the apiary was surrounded by a six-foot, tight, board fence, all within the outer fence, besides buildings and apple trees on nearly all sides. During my 13 years' stay here not a creature has ever received a sting, except where a bee has been stepped on or pinched by children or others. A very few (perhaps 4 to 6) cases of this kind have happened, and some of these half a mile away. This, however, was not the principal grievance; the main complaints were: "The bees get into my pump," into my well," into my cistern," into my tub," etc. Notwithstanding we have used every method we could devise or hear of to water our bees in the yard, more or loss would visit some more. as follows: From 100 to 200 colonies hear of to water our bees in the yard, more or less would visit some mossy buckets and pumps. Another trouble: two or three times some clothes hung out to dry just when the bees took an

bees in tubs, cisterns and wells, and I am so isolated from the powerful bees in tubs, cisterns and wells, and move my appary thereto, some of my supposed friends drew up and circulated a petition asking the Aldermen to exclude bees from the corporate limits of the city of Dowagiac. Not a man in the place, except myself, had a bee or was likely to have one, judging the future by the past. A majority of my nearest neighbors refused to signit, Misrepresentations were made to induce them to sign it (if I have to induce them to sign it (if I have been rightly informed), but without avail. Such a foolish ordinance would have been largely a "corner" on the lmsiness for me, as nineteen-twentithis of all possible opposition in the field would have been cut off. But that did not change wrong to right. I asked the Aldermen to investigate the asked the Antermen to investigate the matter and then decide. They did so, and decided to throw that petition in the "waste-basket." or to table it, which is practically the same thing.

Soon after I obtained a piece of ground to suit me, near the water, and away from houses (except one, the inhabitants of which invited me to bring the bees there, having had some little chance to know something about bees), and that ground is within the corporation limits, and "upon that rock" I propose to "stand," petition or no petition. We have a City Board who are not unwise enough to pass such an ordinance, and no City Board has the power to expel bees from its limits, any more than the raising of onions or cabbage. When they are so kept as to become a misance as aforesaid, they

can order that misance as atoresaid, they can order that misance abated.

As it was to our interest to move our bees away from our supply houses, where our honey and wax works are where our noney and wax works are kept, and we suffer the only real an-noyance, we felt that a disposition to throw oil upon the troubled waters and have good will and peace with all men, was the truly wise and moral course. We adopted it, and moved 120 course. We adopted it, and moved 120 colonies during their work on white clover, and as we only moved them less than a mile, what do you think the result was? Well, we made one strong colony with a comb of brood, a queen cell, and what bees returned.

Now in regard to the ideas of Wr.

Now, in regard to the ideas of Mr. Martin, as given on page 194 of the Weekly BEE JOURNAL for June 22d, I think they are widely open to comment. First, allow me say, that to those neighbors into whose yards I had to go to recover swarms, and where I would sometimes injure the garden plants, we always presented honey to ten-fold the amount of injury. As Mr. Martin says, this present made non-petitioners of them. There is no doubt that if I had extended the donation line far and wide enough to have taken in these petitioners, all would have been peace. But if the damage nave been peace. But it the damage from these pump, eistern and well-loving bees can be appeased with a few combs of honey, should we be obliged to give them to opulent people, when we have people in our midst whose little children are hungry for deserved sweets that their parents cannot afford sweets that their parents cannot afford to buy, perhaps because they are cheated out of their just earnings by cheated out of their just earnings by those more opulent and influential petitioners. Our machine shops are allowed to whistle and rattle, because they are a business blessing; our sawmill proprietor is allowed to fill the roadside for many rods with logs, because he is doing business; the city gravels the road to a grist-milt, because the mill is a blessing to the business interests of the city. Now, should a business which employs two to four men, brings in from the labyrinths of nature from \$1,000 to \$2,000 yearly (thus making two blades of grass grow where but one grew before), rest upon ont to dry just when the bees took an opening light in the spring, were spotted by them. Our own never happening to be out at the right time to get specked, we did not know of the annoyance to others till years afterward, or we would have cheerfully paid the cost of re-washing. Notwithstanding the first two years we kept a large not a word was heard about their fuxures, and who have had educational and observational advantages troubling any one.

Well, just as I had sold the lots containing the bees and was negotiating (trying to obtain a clear title) down by the river, where I would lose no more

(who can send a petition smack into a waste basket). I guess I will continue my former way of selecting donees.

Dowagiac, Mich., June 14, 1881.

For the American Bee Journal.

#### Progressive Bee-Culture.

C. J. ROBINSON.

Wintering and winter management of bees seems to be the theme of corof bees seems to be the theme of correspondents of late. On page 42, of the current vol., Mr. Miner informs the readers of the BEE JOURNAL that "upward ventilation" has been the destroyer. Mr. Miner's idea is that bees must have a free circulation of air to generate heat. However, he concedes that he realized the six from the page of the six from the page of the six from the second of the six from the page of the six from the second of the secon sults when he excluded the air from his 4s colonies by "covering them with snow in the coldest weather." His two modes of wintering are as opposite as science and quackery. But the nub of Mr. M's article is the discovery that an inch of open space between the lower end of a box hive and its bottom-board, all around, would not lose as much heat as a ½ inch hole at the top. Mr. M. says that his box hives were one foot square; then if there was an open space at the bottom of one inch all around, the opening was equal to 48 square inches. Now, ignoring science, if he will open at the base of his sitting-room in a cold day an opening of 48 square inches, and try the effect produced by the rushing in of cold air for a time, and then close the opening at the base and open a ½-inch hole in the ceiling overhead, he might be inclined to change that opinion.

The little learning that 1 have acquired and the experience 1 have had with been during that 2 country.

with bees, during half a century, qualifies me to say how bees can be wintered reasonably successful, and I fear the problem involved in a scientitle winter management of bees is

afar off

The "chaff hive" men, like Mr. Mi-ner, "found perfection" and exclaimed Eureka; but dire destruction still follows each successive winter. The hire cannot obtain honey, nor regulate the climate! Were it not for the devhive cannot our and the climate! Were it not for the devastation of bees during the inhospitable reign of winter and spring, this land would, indeed, flow with milk and honey. Will such a happy fruithe destiny of our race? and honey. Will such a happy fru tion ever be the destiny of our race

tion ever be the destiny of our race? There has been rapid progress in the science of apiculture since the advent of the American Bee Journal. At that period, bee-culture was at a low ebb everywhere, except in some parts of Germany. Then no discussions were had, pro or con on any subject or new idea or theory held with ject, or new idea or theory held, with pect, or new idea or theory near. With perhaps a few exceptions. There were but few correspondents to the Bee Journal, and all had their say, which was taken for granted as revealed truths, like the writings of King James translators. The American ican bee-keeping fraternity and the public generally owe a colossal debt of gratitude to the lamented Samuel Wagner, a German by birth, who was JOURNAL, as well as its present able editor. Conceived in a laudable desire to do good, conducted with a view to the promotion of general prosperity, dedicated to the interests of a hitherto neglected industry, the American Bee Journal established as an experiment has become a "fixed fact," commanding universal admiration, and this pioneer Journal, by unflagging industry, has now reared 17 monuments upon the broad area of

prejudice, and even now—now, when the land is illumed by many others— that same torch (but in other hands) is burning and blazing with a pure and brilliant flame

I am not to flatter nor to treat with contempt, nor to be personal in my writings. I commenced this communication with a view of adding my mite to the subject of winter management, but I have wandered, in memory of my ideal friend and in-structor of former days, but I will now close, hoping to recur to the subject of wintering in a future article.
Richford, N. Y.

For the American Bee Journal.

#### Black agin Italian.

LUKE TWIST.

[Bein' a artical which proves that the Bl cks is superior.

I am an ole man, nigh onto three score nor ten, and mi flaxen lox is thickly spangled with threads, uv silver, and all no this, mi well spent life hez ben passed amung them bizy inhez ben passed amung them bizy insex, bez. Sum no the earliest things that i kin remember is plain round these noise hives, or bein' lulled tu sleep by there sweet music, or dancin' a jig tu the merry hum uv there tierless wings. I never hed much book larnin, thank the Lord, and heve never ben tu skule only 6 weaks in my life, and as I heve not burdened mi mind with seeth passensied trush as gogwith sech nonsensical trash as gog-rafy and rithmetic, yeu see me able tu stand forth and not only cope with. but everlastin'ly demolish the so-called sientific bee-keapers, and, ez a consequence uv not idlin' awa mi time in skule, to be bloated out with bookharnin and self-consete (for yeu will finde humility to be wun uv mi greatest characteristix), i heve ben able to est characteristix), i heve ben able to divote a larg portion uv mi time to practical experimints fer the improovement uv the humpy be, and after yeres uv patient trials and tests, i am forced tu the conclusion thet the black be, in the good ole-fassioned box hives, is the best. I will neaw proceed tu give yeu the menes by which I prooved the Italian uv no good.

I seen a advertisement fer italian beg so i sent a dollar tu jorgee for a

bez, so i sent a dollar tu jorgee for a be, fer 1 hed heerd thet wun be put in the hive wood make 'em all italians. Yeu ma be surprised thet I kin efford tu pay a dollar fer jest wun be, but, yeu sea, I don't spare no panes or muny fer tu make mi experements on-tirelie fre frum fault, and I thaut ez long ez l wuz goin' tu git wun I mite ez wal git a good wun. After a while the bez cum; they wuz tu kinds on um. I didn't no which was the italeans and which wuzn't, so I thaut i'd put um both in, tho wun on um didn't

eans and which wuzn't, so t thaut i'd put um both in, tho wun on um didn't look ez ef he cood fli for greens; it wuz about twice ez long ez the rest and hed wings about half ez long.

I kept em kooped up in that ere little koop untill nite after dark; it was moonlite. Then I quietly snook up tu the hive and opened wun end av the koop and let um run in. I got up in the mornin' expectin' tu find a lot uv them little lazy yaller humbugs crawlin' round; but what du yeu think! not a sine of a yaller wun wuz they! all as black az a republican's harte. I looked round and there they wuz aul heeped un dead on the ground. Neaw ef i'd ben predjudiced agin the italian bes, or didn't heve mi subject thoraly distilled intu me, i'd got mad and nocked over the hive and raised the deuce; but I didn't, I jist thaut tu miself, "neaw I no all there is tu no abaut bez, and they can't no body

whereas I didn't sea tu moths lain' in front of the black beas hive aul summer, them italians hedn't ben thare a weke before i seen 8 in frunt uv them. How is thet fer hi? Tell me that black bez is trubled moar with moths than italians be. Tha wuz purty gentle until after tha swarmed, and then tle until after tha swarmed, and then tha wnz az cross az the dickens. Tha woodn't no moar let me cum nere the hive than a hive my blacks wood let me take hunny awa frum my when tha wnz alive. Tank about italians bein' gentle! And then a nuther thing, ef i ever go tu strain hunny ont-doors them pesky italians is allers round stickin' there tungs inter me; or if iset eny frute out doors to dri it is jist coverd with bez, and these bez is allers italians and new what moar is allers italians, and neaw what moar kin yeu sa agin bez than this: full of moths, cross, and trublesum? Didn't i git moar hunny frum them than i did frum the rest? Yes, I did; but what does that amount to? Don't yeu ever git moar frum wun hive than

yeu du frum a nuther?
And now, Mr. Editor, i wish I hed time tu extend this instructive artical, fer i no that yeu wood rather heve ar-ticals frum wun uv the feu old bekeapers like me than the trash which at present fills year colums; but, you must no, men uv mi ability heve all must no, men uv mi ability heve all there time took up with 1ther matters, and tis with the greatest unconvenyence that i take time tu pen this artical, and on conclusion I wood say wan ward tu the supply dealers. I suppose you will be awful hot at me fer spoilin year trade in italian bezout I don't fele a bit sorry fer ye, and if I hed time turite on the superiority. if I hed time turite on the superiority uv box hives I'd brak ye up in that

wa, tu.

1t, Mr. Editor, yeu wood like mi fotograph tu sell with those uv uther renouned be-keapers, I can supply yeu with a negative.
Hillsdale, Mich., May, 1880.

For the American Bee Journal.

#### Bee Items from Eminence, Ky.

W. T. STEWART.

As reports are now in order I will as leports are now in order I win give in mine, and as I am one of the successful ones as far as wintering bees the past severe winter goes, I shall attempt to give a few items as to my method of bee-keeping,

I put 74 colonies into winter quarters, and in April I had 69, a loss of 5 colonies; 3 were queenless in April, and 1 doubled them up with others; cause of death starvation. All were wintered on the summer stands, packed in fine bay, dry sand, or chaff and sweepings from a flour-mill floor. and sweepings from a flour-fill floor. Those that wintered best were in Hiram Roop's winter protector (of Carson City, Mich.); 40 of them were Roop's, and 20 Langstroth's; none died in the Roop hive. A description of it will be found in a back volume of the Reg. Laurence and in this of it will be found in a back volume of the Bee Journal and in this year's Gleanings. I made them from the description in the Journal. After trying all hives fairly and without prejudice, giving all the same attention, in the same yard, and under the same circumstances, I have adopted Hiram Roop's. I do not know Mr. Roop nor have I hives to sell, or axe to grind in any way, but I do know that Roop's winter protective hive is the very best that I have ever tried for summer or winter: the frames are for summer or winter: the frames are 10 inches square in the clear, 12 frames in the brood-chamber in summer and as few as possible in winter.

as few as possible in winter.

I use in each hive a feeder of my own make, that is in the brood-chanber all the year round; it is simply a trough under the top-bar of one of the brood-frames, the length and width of the frame and 2 inches deep; it helds one wint the balance of the

sugar the very coldest time we had, and never disturbed any bees; it

is suitable for any hive.
I make all my fixtures for the apiary myself and save many dollars by it: I made my own extractor, of a molassees barrel, an apple peeler for the gearing, and the wire bottoms of 2 triumph hives for comb baskets, and it worked all right; it cost me \$1.25

complete.

I get extra pasturage for my bees by saving all the seed that I can get from the Simpson honey plant, which is the the Simpson honey plant, which is the best plant I ever saw; motherwort is the next best; catnip and melilot are good, too. I save all the seed from these 4 plants that I can get, and every time I go out in the vicinity I take my pocket of the seeds mixed, and drop some of them in every available spot, and some come up; the Simpson honey plant, comes up in the Simpson honey plant comes up in the spring only; the others will come in the fall or spring either, and I im-prove my location all the time. It is but little trouble if we have the will to do it, and don't cost anything.

1 put my honey up in the best shape for market, nicely labeled, and 1 sold every pound last year for 20 tents per lb. in my own town; while some were offering it at 12½ to 15 ets, mine would sell first at 20 ets., because it was attractive. Mr. Drane and myself are informing people in these parts how to get up and buy honey, and we are get-ting people's eyes open on the subject. ting people's eyes open on the subject. The season for surplus here is nearly closed and we have but little honey; it is a long way behind last season. No honey and but few swarms, is the order of the day here. Will not Mr. Heddon's doctrine about "bacteria" have a tendency to injure the sale of honey? Some may conclude that if honey will kill bees that it is not healthy for man, and will not use it; Mr. Heddon is right in most things. Mr. Heddon is right in most things, but I wish he could drop that notion until he can prove it. Mr. Doolittle's until he can prove it. Mr. Doolittle's writings have benefitted me a great deal; his head is level on hives; I know by my own experience. Eminence' Ky., June 27, 1881.

#### The Honey Season in Georgia.

A. F. MOON.

The present season, this far, has been more favorable, both in the pro-duction of honey and swarming, than for several years; however, the swarming has not been so great, except in some localities. The principal cause of this was that in some parts the honey-dew was so great that the bees filled up the hives with it, and the queens were deprived of the amount of space necessary to deposit eggs sufficient to keep the colonies strong and throw off swarms. In some localities bees have not swarmed at all, but have stored large quantities of surplus. Had the extractor been used freely, a much better yield could have been obmuch better yield could have been ontained. I have examined several colonies, and find them filled below, almost crowding the queen out. This could only happen when honey-dew was so plentiful. The honey gathered is of superior quality, more so than usual, being a light straw-color instead of a with real country and the color in the color of of a wine-color, as it sometimes is, and is very thick and finely flavored. The is very tinck and intely flavored. The main honey season is about over until the fall honey crop sets in, which is usually in August, or the latter part of it, and the month of September. I have had good strong swarms come off the last of August and the first of September and Old in interest of September and Old in interest. the last of August and the first of sep-tember, and fill their hives with plenty for winter. This, however, is an ex-ception, not the rule. But little or no buckwheat is sowed

here in comparison with the North. am sure that it would almost astonish width of the frame and 2 inches deep; it holds one pint; the balance of the frame is filled with brood and honey; it has a hole through the top-bar and quilt to pour in syrup, with vacant space under the top-bar for bees to go in and out. I fed some colonies during all the past cold winter every week, and they are as good as the best top day. I fed them warm syrup of A

whole season, but it does not allord the amount of honey here it does in the North. This grain requires a peculiar atmosphere. Wherever winter fruit does well I have observed more buckwheat grown, and it secretes much

more honey.

I see by the Bee Journal that therestill exists a difference of opinion regarding the great mortality of bees. Some attribute it to one thing and some to another. Lintend to test the matter, or, rather, have some experi-ments made. I propose to send to three or four editors of bee papers each a swarm of bees from the Sumy South; they will be in old box hives, rather open, but good and strong; these hives open, but good and strong; these hives to set upon their summer stands, unprotected from the cold weather. By this method we may learn where the disease rests—whether in the food gathered or in the cold weather. I think they will stand the test; at least, we can know whether cold weather kills them.

The Weekly BEE JOURNAL comes to hand regular as cheek-work and

to hand regular as clock-work, and does not seem to be much exhausted. Its smiling pages are read with pleas ure. Long may it continue a regular missionary to all parts of the world. To-day 1 received 3 bee papers from the old country. The bee-keepers there, as well as here, are doing a good work.

Rome, Ga., June 21, 1881.

For the American Bee Journal.

#### Honey Bloom in California.

J. D. ENAS.

The young queen I mentioned in the BEE JOURNAL of Feb. 9, did not lay or have any brood until January 10. clipped her wing to keep her from leaving, in case she was so inclined. was not aware that I had any drones at that time, but on Feb. 19 she had yeral combs with good worker brood. I think she is pure; her workers are hatching and look fine. I had several young queens at the same time; they are doing well. I helped the bees out in the spring by uncapping my dark pale honey from golden rod (it has a fine flavor but is too dark to sell), and fine flavor but is too dark to sell), and feeding it to them in the comb between the wet spells. My Italians fly between showers, and very often get caught. They appear to be heavily haden, and we frequently see them alighting to rest. They are very quiet, and but seldom trouble either human henors or stock though at times the beings or stock though at times the air seems full of them. I wish to make a few corrections in

my last article, which says my hives "have no portico, but the front projects." It should be, the top projects jects." It should be, the top projects at the front, which partly shades the entrance. For "on the 15th I took away 20 frames" read I took away the 7 empty frames. Instead of "maganita" read mauzanita.

The mauzanita is regarded here as

a good honey producer. I have watched it closely and fail to perceive that it shows itself that way. I have seen but few bees on it at any time. and those appear to get pollen. The hills have been covered with its bloom, but there appears to have been very little stored in the hives. I have seen wasps and humble bees on it, but if there is as much honey in the bloom as many persons about here seem to think, bees ought not to starve every winter far it generally blooms about winter, for it generally blooms about Nov. 1. The willows look different, when fine enough to fly anyone can see swarms of bees on the bloom. The idea here, too, is that the chemisal furnishes honey. When it is in bloom the hills look to be covered with snow, but the bees only occasionally visit it.

We have a bush that bears clusters of red berries in the fall; it is called here bear bush, as the bears eat the berries; while in bloom the bees appear to get intoxicated over it. I have pear to get intoxicated over it. I have seen, in a cluster of flowers as large as my hands, 50 hees, all busy and peaceful. If the evenings are cool many get belated and stay all night, and thousands of old and young bees

whole season, but it does not afford the can be seen on the ground under its branches, apparently dead. When the bloom of it is over, then look out for robbing Napa, Cal.

For the American Bee Journal.

#### Fastening Comb Foundation.

J. F. KIGHT.

I notice in almost every number of the BEE JOURNAL anarticle in regard to fastening comb foundation. As there seems to be a great many ways there seems to be a great many ways of fastening it, I will give mine, which is as easy and rapid as any one need wish for. My frames are Langstroth, some with tongues and some with v-shaped top pieces. Having the wires all in (of which, by-the-way, 5 is all that are necessary) get a board just to fit the inside of your frame, then a pail of water to wet the board to keep the way from sticking to it them a 1the wax from sticking to it, then a 1 cent piece fastened to a handle and a groove cut around it with a file, or what is simpler still, a shoe buttoner with a notch cut in the heel of it, now with a notch cut in the heel of it, now place 5 or 6 pieces of foundation, with about half an inch in the suushine (for more will get too warm) and you are ready for business. Place your board across your lap (after you have wet it), and if you have a little 4 or 5-year old girl let her hand you foundation, and place more in the sun as you work them; they will do it as well as you can, and delight in it, too; place the edge that is warm next to the top-bar of the frame and with your thumb or thumbs press tightly; now turn it over, and with your cent or buttoner run on each wire from top or buttoner run on each wire from top or buttoner run on each wire trom top to bottom, and it is done. In this way my little 4-year old girl and 1 fastened 50 in 30 minutes. I have nearly 300 worked out, and not one sagged or fell

down. Now for the sections, cut your starters just the size you want them, lay them handy, to your left, for instance, and your sections inverted lying just before you, now get a chisel anywhere from 1 to 4 inches wide, and put it in the fire about 20 seconds and you are ready for work. If you are quick-motioned you can fasten about 12 before your chisel is too cold; place your starter where you want it, press the edge of it with the chisel, now invertagain and straighten the starter, and again and straighten the starter, and when cold it will stick like a leach.

If any reader of the BEE JOURNAL desires to fasten foundation, give the above a trial and he will be surprised at the rapidity. I would rather miss my dinner when hungry than to miss one number of the BEE JOURNAL.
Poseyville, Ind., June 27, 1881.

#### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

CHICAGO.

HONEY—There is no new comb honey in market.
We quote extracted, 7% off loc.
BEESWAX—Choice yellow, 18@22c; dark, 15@17.

NEW YORK.

HONEY-White extracted, 166 10c.; dark, 768 × c BEESWAX.-Prime quality, 20623c.

CINCINNATI.

HONEY.—The market for extracted clover oney is good, at Sig 10c.
BEESWAX—18@22c. C. F. MUTH.

SAN FRANCISCO.

HONEY—A lot of 1,216 cases and 3 bbls was forwarded this week on a wheat ship to Great Britain, the honey in cases being in Lauey packages and shipped by a prominent packing firm. The visible supply of old is light and firmly held. Quotations are entirely nominal. For some old extracted an advance on quotations is asked, but there are no buyers at our extreme figures, except in a retail

Way. We quote white comb, 120014c.; dark to go. d. 900 II. Byracted, choice to extra white, 708.c.; dark and candied, 500c. BEESWAX—250g25c.

STEARNS & SMITH, 423 Front Street. San Francisco, Cal., June 25, 1881.

The Northwestern Bee-Keepers' The Northwestern Bee-Keepers Association will meet in Chicago, on Tuesday and Wednesday. October 25 and 26. All bee-keepers are cordially invited to attend. It is desired to make this one of the most interesting conventions ever held in the United States. C. C. Miller, M. D., Pres. C. C. COFFINBERRY, Sec.

THOMAS G. NEWMAN,

EDITOR AND PROPRIETOR, 974 WEST MADISON ST., CHICAGO, ILL

TERMS OF SUBSCRIPTION:

WEEKLY - (52 numbers) \$2 a year, in advance. Three or Six Months at the same rate. SEMI-MONTHLY—The first and third numbers of each month, at \$1.00 a year, in advance.

MONTHLY - The first number of each month, at 50 cents a year, in advance.

Any person sending a club of six is entitled to an extra copy (like the club) sent to any address desired. Sample copies furnished free. 17 Rem by money-order, registered letter, express or bank truft on Checago or New York, payable to our order. Such only are ut our risk. Checks on local banks cost us 25 cents for collecting.

Free of postage in the United States or Canada. Postnge to Europe 50 cents extra.

Entered at Chicago post office as second class matter.

CHICAGO, HLL., JULY 6, 1881.

#### "The Coming Bee."

We cannot refrain from giving the following letter from Mr. J. S. Tadlock, Kingsbury, Texas, a prominent place in our columns, and hope all progressive apiarists will give the proposition the consideration its importance de-

I had 22 colonies this spring to commence with, but had to use all except one in queen-rearing; that one I deone in queen-rearing; that one I determined to let alone, to see, for my own satisfaction, what one colony would do during the season. It gave me 107 lbs. of honey (extracted) up to June 15, also one large swarm. I managed them on the Doolittle plan of side and top storing combined. I send you a few of the workers of these examines them and see alone; where examine them and see send you a rew of the workers of this colony; please examine them and see what you think of my Texas bees; they are the third generation from an imported queen. I want to make a proposition to the bee-keepers of the United States. Let every bee-keeper United States. Let every bee-keeper who feels so inclined send to you the sum of 25 cents to be put in one comsum of 25 cents to be put in one coin con purse, and be awarded to the man that will send to the National Asso-ciation for exhibition the largest and longest worker bees. I like fine queens, but it is the workers that gather the honey. Would this not be gather the honey. Would this not be the best plan to find and eatch the coming bee?

Here bees are doing nothing now. We have had a fine flow of honey from horsemint (the best of all honey plants) but a drouth of 2 months' duration has dried it all up. The bees have plenty dried it all up. The bees have plenty of honey in the hives and are getting sufficient pollen to keep up breeding.

The bees sent us are large and fine, but very dark. We cannot say, however, that they appear in any way superior to many others we have seen; they were badly bloated with feces when examined, and somewhat bedaubed with honey, which would detract much from their natural appearance as seen generally around the hive. Mr. Tadlock has, we think, suggested the right course to find the "coming bee." It might be well for the National Society to offer a gold medal, or set aside a percentage of net receipts, or in some other way adopt measures to stimulate a general competition for the production of the "best bee" for all purposes; also for the best honey plants for cultivation, use, and perhaps other progressive steps which might be suggested, as thick as the walls of the cell. These questions should not be hastily

nor by an exceptional result. The cular cut along its periphery. Being National and various District Socie- nearly detatched from the cell walls. ties have done much in elevationg and advancing scientific apiculture, but the results of the past are but a meager index of the future. We cannot well imagine how any bee-keeper can regard with indifference the duties devolved upon him to sustain and encourage Local, District, State and National Societies, and especially should every person attend the Conventions and contribute of his wisdom and experience to the general good. We hope Mr. Tadlock will be present, with all his Southern friends. at the next National Convention, to urge his proposition, which will undoutedly receive a hearty support from the Northern bee-keepers present.

#### \_ . . . . . . Development of Queens and Bees.

Mr. H. Hance, Bryan, O., asks for an answer to the following questions in the BEE JOURNAL: "How long does it take to rear a queen from the egg-that is, till she is ready to fly? How long is it, after she emerges from the cell, before she will take her wedding flight?

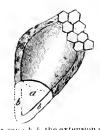

Having passed 3 days in the egg and 5 in the larval state, the workers close

Larva of Bee.

the cell, and the future queen commences to spin her coeoon, which occupies about a day. Then, apparently exhausted by her labors, for 3 days she obtains complete repose, and on the 16th day, as a perfect queen, she emerges from the cell. The strength of the colony and the character of the season may vary it a day or so.

When the embryo queen is nearly mature, within 12 to 16 hours of emerg-

 $a_i$  convex cup;  $b_i b_i$  the extension of the cell. Finished Queen Cell, scaled over.

ing, the bees begin to demolish the exterior compartment, or extension of the top of the cell, reducing it to a level with the outer edge of the cap of the cell proper. The convex cap being then very prominent, is very 25 days, counting from the egg.

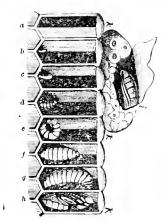

Ripe Queen Cell, with the exterior compartment removed.

torily demonstrated in a single season, her mandibles, and then makes a cirthe cap drops, opening a circular passage, through which the young queen emerges.

> From the egg to the queen emerging from the cell, takes 16 days. She is then a virgin queen, and for 5 or 6

Eggs and Brood.

, empty cell; b and c, eggs; d, e, f and g, various stages of the larvae; h, pupa; i, pupa of queen in queen cell; k, k, caps.

days she moves around in much the same manner as a worker bee, helping herself to honey from uncapped

About the 5th day, if the weather is pleasant, she may be seen crawling about the entrance of the hive, and if the next day is propitions, she may try her wings some from the alighting board. She will appear somewhat excited, but after awhile she will mount up and circle around, increasing the distance each time, to mark the hive, and insure a safe return from her wedding flight.

In the warmest part of the afternoon, when the drones are flying, she will spread her beautiful wings and soar into the air to mate with a drone. If successful, she will bear the marks of it on her return; if not, she will, after a time on the same day, come out again and again, until it is accomplished. She will then return, going quietly into the hive, and in a day or two she will commence to lay; so that, generally, from 8 to 9 days after emerging from the cell, the queens are laying. Should the weather be unfavorable, and she fails to meet the drones within about 20 days, she will have failed in the object of her existence, and become only a drone producer.

The drone passes 3 days in the egg, about 612 in the larval state, and changes into a perfect drone in 24 or

The worker, after passing about  $3^{1}_{2}$ days in the egg, is hatched—a small white worm, grub or maggot-and is called larva, (a Latin word signifying a mask, for the bee is concealed or hidden in that state). It remains in this state about 5 days and then the bees seal the cell over; the larva then spins around itself a silken covering, called a cocoon, which occupies about 36 hours. In this third stage it is called liable to be injured, and to protect it a nympha, pupa or chrysalis, in which the best hive for winter and summer from injury the bees coat it with a state it remains until the 21st day, counting from the time the egg was

The cocoon, left behind, forms a lining to the cell, and for this reason it is best not to use the same breeding comb too long, for each eocoon left behind imperceptibly, but not the less really, diminishes the size of the cell for its future occupant, and prevents the bees from attaining their full development of size.

When the weather is cool or the colony weak, the development is retarded to a greater or less extent-the heat should be above 70 Fahr, for the best results. Both the workers and the drones, on emerging from the cells, are rather helpless, and are soft, downy, and light in color.

The workers and drones spin complete cocoons, inclosing themselves perfectly, but queens inclose only the head, thorax, and first ring of the abdomen-evidently to provide for the means of being destroyed by a rival queen, before emerging from the cell, should it become desirable to do so.

In the contemplation of this exceedingly interesting subject is found much food for thought and meditation, and for instructive lessons none can rival the marvelous transformations that insect life undergoes in its processes of development! The repulsive maggot of to-day, may to-morrow be the active little fly, visiting leaf and flower, in merry and sportive mood! The repugnant caterpillar of to-day, may to-morrow, as a chrysalis, be decked with green and gold, awaiting its speedy transformation to the butterfly, of brilliant tints and gorgeous beauty.

This is not a whit more wonderful than are the transformations from the egg to the tiny larva, from the larva to the pupa, and from the pupa to the fully developed honey bee, with its wondrous instincts, and marvelous habits! The student never ceases to wonder and admire, as he turns over leaf after leaf of the "book of nature," devoted to this interesting insect. Indeed, there is a fascination about the apiary that is truly indescribable; but even that richly rewards the apiarist for all the time and labor bestowed upon it. Every scientific bee-keeper is an enthusiast. The wonderful economy of the bee hive, from its very nature, presents to the thoughtful student, both admiration and delight at every step!

S Mr. Root, Editor of Gleanings, has several times very kindly noticed the Weekly Bee Journal, contrasting with some other bee papers who have never said a word concerning it. The July number of Gleanings in  $B\epsilon\epsilon$ -Culture says:

The American Bee Journal has The AMERICAN DEE SOURNAL has completed its first 6 months as a Weekly, and has proven a success, as it could not well help being, with the able way in which it is gotten up—clean nice print, good paper, and brim full of "bee-talk" that could not all your well find plage in a monthly very well find place in a monthly.

Thanks! Gleanings stands at the head of the Monthlies, and is filled with interesting reading for bee-keepers, especially beginners. The BEE JOURNAL is often obliged to disagree with Gleanings on many things, but laid, when it emerges from the cell a we desire always to be on good terms The young queen pierces a hole perfect working bee, and is called an with all co-workers, and wish them abundant success.

### MISCELLANEOUS.

Bee Notes for July. -Mr. L. C. Root, in the American Agriculturist, gives the following hints for this month:

It is all important that everything should be in proper condition for securing surplus honey during the present month. Basswood will begin to blossom about the middle of the month in Central New York and sim-ilar localities. We expect our largest yield of best honey from this tree, hence the necessity for abundant storing space, whether box or extracted honey is to be secured. If box honey starter of either white comb or comb foundation. The amount of honey which can be secured by using full cards of comb foundation will be found a greater than who would be found a greater than who wolk charter. much greater than when only starters of natural comb are used. The very of natural comb are used. The very great advantage to be gained by the use of comb foundation, both in the brood-chamber and surplus boxes, should be investigated by every bee-keeper who reads these notes.

If the surplus honey is to be taken with the extractor, a sufficient numwith the extractor, a sufficient number of good extra combs must be supplied. These may be added at the sites of the brood-nest, or at the top of another story to be added to the hives. Another advantage in the use of comb foundation is seen in case there is not a sufficient number of surplus combs at hand, the frames may be filled with foundation, which will soon be formed into combs and filled with honey. When these are filled the honey may be thrown from filled with honey. When these are filled the honey may be thrown from them by the extractor, and the combs be returned to the hives to be refilled. Boxes should be removed promptly when completed, as the appearance of the honey is injured if left upon the hives, where the bees travel over it.

Very Little Swarming.—The Texas Patron, published at Crockett, Texas, says:

We are in receipt of the American BEE JOURNAL, a Weekly, published by T. G. Newman, at Chicago, at \$2 a year, in which we find proceedings of State Convention of bee-keepers, held at McKinney, Collin Co., Texas, on the 12th of last May. We have perused this issue with much interest. o a bee-keeper there is no publication more useful and interesting. After diligent inquiry about bees in Texas we report the following facts: During the past season they have hardly swarmed at all. There has not been an average of a swarm to a dozen been an average of a swarm to a dozen good colonies, and in most cases they have gathered but little honey; not enough to pay for robbing. And singular to tell, all they have gathered is granulated. Most of it is solid—candied, as it is called. We do not suppose there has been one pound of good fluid honey in our market this season. This is a very remarkable fact and is This is a very remarkable fact, and is worth the attention of the scientific.

Bees Poisoned by "Foxglove,"-Dr. A. Paterson, in the British Βεε Jour-

Last summer I had a large quantity of foxglove (Digitalis purpusea), cultivated varieties, and very beautiful in bloom, at the same time a quantity of canterbury bells growing near them, and in flower. I was much struck to and in flower. I was much struck to find that a great number of the working bees were lying dead in the flowers of the canterbury bell. Day after day I watched, with much interest, the movements of the bees, est, the movements of the bees, and found that after they had fed some time on the flowers of the foxglove they became stupid, and after leaving the foxglove they went into the flowers of the canterbury bell, and, as a week.

rule, died shortly after. Query—Did they die from the poison got in the foxglove alone, or did it depend on their coming in contact with the flow-ers of the canterbury bell? I could not find any dead bees on any other plant or on the ground near by.

The Honey Crop in Canada. - The anadian Farmer gives its views on the subject in the following language:

What the honey harvest of this year will be it is impossible to say. So far the weather has been unfavorable to a heavy honey flow. In many parts to a heavy honey flow. In many parts of the country not a shower moistened the earth during the proverbially showery month of April; neither were the May flowers stimulated to growth by refreshing rains and unit of the by refreshing rains, and up to the present writing, June 15, we have had but one shower this month. To make bad worse, the northern part of Onbad worse, the northern part of Ontario was visited with a scorching frost in the beginning of June, which cut down every tender thing, and some of the more hardy plants and trees suffered not a little from its effects. White clover, the principal source of June honey, was badly blackened, its vigor checked, and its honey reclusions was dealthers in honey producing powers doubtless injured. All this taken in connection with the immense decrease in bees from winter losses point to the fact that the honey crop of 1881 will be a short one. Nevertheless, if we are yet visited with timely rains, white clover, Canada thistles, sumach and basswood may yield their wonted quota of the nectar.

Fertile Workers.-The Indiana Farmer remarks as follows on these pests to the bee-keeper:

Colonies that are allowed to stand queenless, for any length of time, without brood and eggs from which to rear queens, will be very apt to contain fertile workers. The evidence that these pests have taken possession will be found in the promiscuous manner in which the eggs are scattered around in the combs, sometimes one, but oftener 2 or 3 in each cell, which will only produce drones; although the bees will build queen cells around them in the endeavor to rear a queen. The only remedy then is never to a colony to go any length of time without a queen, or eggs from which A colony containing ferto rear one. tile workers will neither accept a queen if given them, nor rear one if brood is given them for that purpose. There is no way to distinguish the egg-laying workers from any of the others, unless you should see them in the act. The quickest and easiest way to dispose of these pests is to take a frame of brood with adhering bees, and place in an empty hive on the old stand, remove the old hive some distance away, take out the frames, shake all the bees off on the ground, and they will return to the old stand and go to work without further trouble.

Glucose for Wintering Bees .- Our readers are well aware of the persistent war we have made against the use of glucose or grape sugar for feeding bees. Some 2 or 3 bee periodicals have advocated its use, but at last Mr. A. I. Root, its chief advocate, is convinced that it works disaster, and in Gleanings for July (page 321) he says:

As grape sugar seems, without question, to "make many of my brothers to offend," I will, for the seems, without present at least, drop it.... In the next edition of the "A B C," and also in our Price List, I will.... advise against the use of grape sugar.

In our next issue we will give his reasons for coming to this conclusion. Gleanings has come to hand just as we are ready for the press, and we can make no further allusion to it this

Bees are just Booming. —I have taken off more honey this season up to date than for 3 seasons before, being an average of H lbs. per colony, and one swarm from each colony Basswood is just coming into bloom we have an abundance of it and it we have an anundance of it and it will certainly be very full of bloom. White clover is plenty, and is rich with honey this season; last year it was a failure. I expect to have a good report to make at the end of the season.

M. 11. WOLFER.

Richmond, Ind., June 25, 1881.

Splendid Honey Season.—Bees are doing well in the sotheastern part of Indiana; they are commencing on the basswood, which is in full bloom. There is a splendid white clover crop. This season is unusually good white clover and basswood. I s white clover and basswood. I shall report the amount gathered at some future time. J. W. STURWOLD. Haymond, Ind, June 27, 1881.

How to Construct a Bee House. want to build either a cellar or warm. house this fall, for fruit, potatoes, and bees, which will be the best and cheapest? If a house, what material is best, brick or lumber, and how thick the walls? Will a warm house above ground do to winter bees in as well as a callur? I have seen a different chalce cellar? I have seen a uniform and sizes of hives all called the Langand sizes of hives all called the Lang-stroth hive; now please state what is the regular Langstroth hive length, width and depth? Will those who have had experience in building cel-lars and bee houses please give their opinions in the BEE JOURNAL? Sucto the JOURNAL and its editor.

Mansfield, Ind. D. S. KALLEY. [The standard Langstroth hive is 141 x 183 inches inside, and 10% inches deep, and contains  $10 \, \mathrm{frames}, \, 91_8 \, \mathrm{x} 175_8$ inches, outside measure. Will some one who has built a winter repository that has been a success during the past winter please give the inquirer the manner of construction.—Ep.1

Bees Doing Well, -DEAR JOURNAL: Yes; I want you every week, and here is a dollar to pay for your visits the remainder of the year. If I should fail to remit when my time is smain rair to remit when my time is out, do not take my name off the books, for I want to see you while I live and handle bees. Bees are doing well now; they keep me busy attending to their wants. There has been plenty of rain through this month, but through the ording routh of N. but through the entire mouth of May it did not rain enough in this place to lay the dust.

L. EASTWOOD.

Waterville, O., June 28, 1881.

Liquid Grafting Wax. - As Mr. Case wants a receipt for grafting wax that is not composed in part of beeswax, I is not composed in part of beeswax, I will give it. Melt one pound of common rosin over a gentle fire, add to it one ounce of beef tallow and stir it well, take it from the fire, let it cool down a little, and then mix with it a tablespoonful of spirits of turpentine, and after that I counce of terre there. and after that 7 ounces of very strong alcohol (95 per cent.). The alcohol cools it down so rapidly that it will be necessary to put it once more on the fire, stirring it constantly. Still the numest care must be exercised to prevent the alcohol from getting inslaned. The best way to avoid it is to remove the vessel from the fire when the lumps, that may have been formed. commence melting again. This must be continued until the whole is a ho-This must in continues and the whole is a non-mogeneous mass, similar to honey. It is very cheap, very easily prepared, and when corked up in a bottle with a tolerable wide mouth, keeps at least 6 months unaltered. It is laid on in as thin a coat as possible, by means of a flat piece of wood. Within a few flat piece of wood. Within a few days it will be as hard as a stone. In

addition to all the advantages indited above, it is not in the least affected by the severe cold of our winters; it never softens or cracks when exposed to almospheric action or changes. There is no better preparation for covering the wounds of trees. Anyone trying the womans of tees. Anyone trying this receipt will please report through the columns of the BEE JOURNAL; I have never used it myself. L. A. LOWMASTER. Belle Vernon, O., June 28, 1881.

Prospect for Abundant Honey Crop.

The JOURNAL is a necessity and I
do not want to do without its, weekly visits. I lost 3 out of 11 colonies of bees last winter—but about  $\frac{2}{3}$  of all the bees in lowa County are dead. R. saved only 22 from 80; H. 1 from 100; and some lost all they had. Bees are doing well now. White clover is abundant, and linden is commencing to bloom.

E. H. NORTON.

Marengo, Iowa, June 30, 1881.

My Texas and Arkansas Trip.—1 reached home on June 4, having been absent in Texas and Arkansas 27 days. I wrote you last from Honey Grove, Texas, where I visited an apiary of 90 colonies of bees. At Clarksville I met Mr. J. W. Baker, a genial, wholesouled bee-keeper, who is doing much to help on the cause of scientific beeculture. Bees do well here and give large yields of surplus honey. I went to Little Rock, Ark., by way of Texarkanna, over the Pacific and Iron Mountain Railways. Little Rock, the capital of the State, is pleasantly situated on the west bank of the Arkansas river, has a population of 22,000, and fine railroad facilities. There are no large apiaries there, but quite a number of small ones. Prominent among them are E. H. Chamberlain, S. B. Kirly, W. N. Parrish and S. H. Nolin. The latter is editor of the Spirit of Arkansas, a paper devoted to the farm, home, and work-shop. Bees pay a large dividend on the capital invested. Little Rock is a beautiful city, and with its superior railroad facilities, will grow. The railways are developing the country. The officers of the Iron Mountain, the Fort Smith & Little Rock, and Little Rock & Memphis Railways have our thanks for courtesies shown, as representative of the North American Bee-Keepers' Association.

Dr. W. W. Hipolite, Devall's Bluffs, I wrote you last from Honey Grove Texas, where I visited an apiary of 90

ers' Association.
Dr. W. W. Hipolite, Devall's Bluffs, Ark., is a progressive bee-keeper, has an estimable wife and children, and has a model apiary. He uses 1 and 2-pound sections, and says he cannot supply the demand at Litte Rock at 20 cents a pound. While here we visited the apiary of Mr. A. W. Sory, who has 70 colonies of bees in Langstroth hives, run for comb honey in 1 stroth hives, run for comb honey, in 1 and 2-pound sections, he ships to Little and 2-point sections, he strips to little Rock and Hot Springs, where he finds ready sale at 20 cts. per lb. Mrs. Sory is well posted in bee-culture, and equally interested in the management with her husband. Arkansas is one of the best States in the Union for honey production. It has excellent climate and rich soil, with many honey producing forest trees. At Memphis we found white clover as well as in Arkansas, Board and the light. as in Arkansas. Bees do well in the Mississippi Bottoms, but when they swarm are apt to go to the woods, for trees are easy of access. On our way trees are easy of access. On our way home we passed through Western Tennessee, where bee-keeping could be made quite profitable. On account of poor health we were unable to attend the Convention at Mexico, Mo., which we much regretted, feeling a great desire to next them in general. great desire to meet them in council. N. P. ALLEN. Smith's Grove, Ky., June 8, 1881.

How the Bees are Doing.—Last fall I had 74 colonies and lost  $^{1}_{2}$  of them during the winter; which dwindled to 14 in the spring; 6 of the best have already gathered 50 lbs of honey each; the others are in fair condition. I had 4 swarms, and 6 more are ready to swarms, and 6 more are ready to swarm, being very populous. Bass-wood yields little honey; white clover is late but good. G. W. HORNER. Dubuque, Iowa, June 27, 1881.

Read before the S. W. Wis. Convention.

### The Location of an Apiary.

EDWIN FRANCE.

Of course, keep the bees at home if possible, as it will save a great deal of extra work and travel to take care of them; but we are not all situated ina good location to keep bees, as it is a positive fact that some locations are better than others for bee-keeping. Because a man does not happen to live in a good location is no proof that he cannot be a successful bee-keeper. There are some bee-keepers who have There are some bee-keepers who have so many bees that it is more profitable to keep them in several places. I have been in the bee business quite a long time, and have had occasion to locate my apiaries in several places, and I find a great difference in places.

There are more things to be thought of than one would at first suppose, and I find a great difference be thought of than one would at first suppose, and there is a great difference between a farmer keeping a few bees for his own use, and making a regular business of it, where a man wants to keep all his location will support.

The first thing to look after is the pasturage for the bees, something that will produce good honey and plenty of it. Our best and most salable honey comes from the white clover; next basswood; then buckwheat. For early spring work we want willows and fruit blossoms, with a good range of fall flowers for late work. The more we have of all these good things together, the better, as far as honey is concerned. But there are other things concerned. But there are other things to be considered; we must have some to be considered; we must have some natural protection for the bees, some-thing to break off the wind—espec-ially the north and west. Certainly, if we intend to winter on the summer stands, it is of more importance to break off the winds than to keep off the snow. Do not locate on a piece of ground facing the north, and if there are shade trees, so much the worse. There is another point: Do not put the bees close to a public road, where there is much travel—it will not do. The bees will make trouble, people will get stung, horses will get stung and get stung, noises will get sting and be very likely to run away and per-haps kill some one and smash up things. I had 50 or 60 colonies of bees one year close to a road that was trav-eled very much. There was a great deal of growling and threatening, and some stinging and hard feeling, etc. I went through the season without paying any damages and then moved them to another place further from the road. Again, if we keep our bees so close to other people's land that they will be troubled by them while at home or at work on their own land, they will not like it and it will make trouble. We should always keep on good to the constraint of the

ble. We should always keep on good terms with our neighbors.

I see by our bee-papers that one bee-keeper has become involved in trouble about his bees making free with his neighbor's grapes. The bees worked on the grapes, the grape man became angry and destroyed some 60 colonies of bees with poison, and they are now in law about it. So I would not locate an apiary near a vineyard of any extent. If the same man owned the grapes and the bees, there would be no trouble. Traise grapes and bees the grapes and the bees, there would be no trouble. I raise grapes and bees on the same ground, and sold 2,000 lbs, of grapes last year. I picked the most of the grapes myself. There were a good many bees at work on the grapes are grapes and grapes suching the initial cracked grapes, sucking the juice: but they never offered to sting. They would always fly away when I jarred the vines. After I had picked my basket full, I set it in the shade and put a cloth over it to keep the bees away from the grapes while I picked more. Bees never open a grape themselves, but they will suck the juice from those that are opened from any other cause, and it is easy to see how they would annoy a man that had no interest in the bees, especially if he

was afraid of them, which is the case sometimes. It seems strange to us who are used to handling bees, to see a man squirm and dodge around, and get so nervous about a little bee; but there is a great deal in getting used to

anything.

When we locate away from home we when we locate away from nome we must take into consideration the time it will take to go and come, the roads over which we must travel, and if there is water handy for the bees to drink—some natural stream or springy ground; if there is not, you must supply them with water in some way. If ground; if there is not, you must sup-ply them with water in some way. If this is not done, the bees will be sure to trouble the family it the house' about the pump or well bucket, for water they must have, and they will get it where they can the easiest. I find it is hard to find the right kind of legation for the bees and find the find it is hard to find the right kind of location for the bees, and find the right kind of a family living on it; we must leave them under the watchful care of some one, and it will not do to leave them with anybody and everybody. It must be a good, honest family, they must be a good, honest family, they must be a good, where with ily: they must not be tinkering with the bees themselves, and as far as they can prevent it, not allow anyone else to meddle with them. I want to do or oversee all the work with my bees myself, and it is not necessary to see them oftener than once a week or 10 days in the business transfer of the year. days, in the busiest part of the year, and when they are fixed up in the fall there is no more to do with them

until spring.

There are some neighborhoods that There are some neighborhoods that would be very risky to locate in on account of thieves; but on this score I have had but very little trouble so far. One year I had 2 hives opened, and one of them was entirely destroyed. There were some combs of honey taken out, the hives left open, and the other bees took out the rest of the honey. But this trouble homeward in honey. But this trouble happened in the yard that I had so close to the road. Some of the boys thought they would get even with me for the trouble they had in passing along the road. As to over-stocking any location there seems to be a great difference of opinion. I have always kept more bees in ion. ion. I have always kept more bees in my home yard than I have in any other yards, but have never kept much over 100 there. When there are 100 at home and forty or fifty in some other yards, I could not see that there was any difference in favor of the few; but Let think that any blee each be any difference in favor of the few; but I do think that any place can be over-stocked with bees. I do not think it would be best to locate an apiary in a neighborhood where there were 100 or 150 colonies located already—that is to make a specialty of keeping bees. If I was living near 150 or 200 colonies of bees, with some other business, and wanted to keep a few hees, I would not hesitate about it at all. Mine would have as good a chance as the rest. I think 100, or at most 200, in a range of 3 or 4 miles is a plenty; but of course it depends altogether on the amount of bee pasturtogether on the amount of bee pasturage that a location contains. Some places would keep 500 well, when 100 would starve on some other location equally as large.

### Union (Ky.) Convention.

The Union Bee-Keepers' Association convened at the apiary of Capt. S. T. Drane, Shelby county, Ky., on Tuesday, June 21, President Dr. Brown in the chair. After the transaction of some business, including the receiving of two valubale members, viz. Esquire J. G. Byars and Mr. Bird Smith, of Simpsonville, the Rey. Mr. Crutcher, of Eminence, was invited to preside over the deliberations of the meeting.

A letter from Dr. N. P. Allen, of Smith's Grove, Ky., President of the National Association, and also of the Kentucky State Association, was read

sense of the word; that it was not necessary that he should look to the honey bee for his daily bread; that he owned broad acres over which fine cattle roamed, yet he takes a deep and enthusiastic interest in the culture of the honey bee, and to this end he has traveled thousands of miles for no other purpose than to dispense useful other purpose than to dispense useful knowledge concerning scientific beekeeping. The speaker said that when he saw such men as Dr. Allen, men of high standing, socially and intellectually, earnestly grappling with the knotty science of bee-culture, he felt sure that the dark mist of the past would soon be dispelled, and hundreds of men, and women, too, will be able to make an honest and easy living from the products of the "busy bee."

Dr. Brown, of Eminence, Vice-President of the Kentucky State As-sociation, and President of the Union Association, spoke in behalf of more thorough organization for the purpose of acquiring knowledge of the science of bee-keeping, urging better attandance much the sessions of the tendance upon the sessions of the several societies in the State. His remarks were well received.

An interesting discussion concerning bees and their product followed, participated in by a number of gen-

tlemen present.

A wise feature in the programme was the practical lessons taught by the actual manipulation of bees and bee-fixtures. Honey was taken from the hives in frames and "uncapped" with the uncapping knife, placed in the honey extractor and the honey was extracted. Comb honey was removed from the surplus apartment of hives, queens were hunted up and exhibited. All in the sight and presence of ladies and gentlemen, without any of them being disturbed by the bees, though no protection was resorted to except a bellows bee smoker which was used to subdue the bees.

A grand feature of the occasion was A grand reature of the occasion was the spreading of a sumptions repust, consisting of roast beef, ham, bread, pickles, butter and milk, and honey white as the drifting snow, and the hot cup of coffee. The presiding genii were the two Mrs. Drane and other ladies whose names we did not the same of the same of the miles. other ladies whose names we fid not learn. Suffice it to say, that under those tall thickly set trees, around which the woodbine twineth in real and artistic beauty, the "picnicers" did ample justice to the occasion.

A vote of thanks was tendered Capt.

A vote of thanks was tendered capt.

Drane for the princely manner in which he entertained the Association and others. The meeting then adjourned to meet at Shelbyville, on the first Tuesday in October next.

LIFE and ADVENTURES of ROBINSON CRUSOE. This well-known book may be ranked as the most popular standard juvenile hook ever printed. Our edition is complete, and contains the wonderful adventures of a cast-away upon a desert island. Complete in one vol. Fully illustrated. THE PILGRIMS PROCRESS

From this world to that which is to come. This remarkable book, as every one knows, was written under the similitade of a dream, by John Bunyan, the most popular religious writer in the English language; and perhaps more conics have been sold than any other hook except the Bible. Our edition is complete and unabridged, with appropriate illustrations.

GULLIVER'S TRAVELS.

ULLIVER'S TRAVELS.
This book tells of the supposed travels and surprising adventures of Lemmel (fulliver into several remote regions of the world, where he met with a race of people no larger than your hand. Also bis wenderful exploits among giants. Complete in one volume. Finely illustrated.

bis wenderful exploits among giants. Complete in one volume. Finely illustrated.

THE ARABIAN NIGHTS' ENTERTAINMENTS.

Illustrated with numerous wood engravings, descriptive of those many strange and engular stories which the legend says the Sultaness of Persia related to the Sultan night after night, in order to prolong her life, and thus finally won his affections and delivered the many virgins, who but for her would have been sacrificed to his unjust resentment.

SAVED AT LAST FROM AMONG THE MORMONS

Every man and woman in the land should real this story which is founded upon facts, and gives an insight into the low estate of woman under the Mormon rule.

the Mormon rule.

BREAD AND CHEESE AND KISSES.

By B. L. Parpeon. A very popular Christmasstory after the style of Dickens; abounds in excellent and novel features; is chiefly remarkable for its admirable picture of country life, giving the history of a very happy and contented young couple who thought no tot in life too lowly for the pure enjoyment of Bread and Cheese and Kisses. Complete in one volume, with illustrations.

NOBLE DEEDS OF MEN AND WOMEN.

A history and description of noble deeds, presenting correct and heautiful models of noble life to awaken the impulse to imitate what we admire. By the recorded actions of the great and good we regulate our own course, and steer, star-guided, over life's trackless ocean. The usual price of these books bound in cloth is \$1.00 to \$3.00 cach. We propose to bind them in heavy paper or thin card board, and send them by mad and prepay the postage, for 25 cents cach. They comprise a wide range and striking diversity of the most brilliant and pleasing productions of the most noted and popular authors, and include books of travels, adventures, fiction and humor, so that all tastes will be suited. We propose to call it the FARM AND PRESIDE LIBRARY, and any one obtaining these ten lacks will possess a library of ten of the most popular books ever published. We have not room to give a full description of each book, but all will be delighted who obtain these noted books at so low a price.

THE HOOKS will be the latest and most complete editions, and will contain many illustrations, one alone requiring thirty-nine pictures to complete it.

THE PAGES are about 5½ by 8 inches—the most convenient size for reading and preservation.

THE TYPE is Minion, easy on the eyes. THE PAPER is heavy and of a beautiful white color.

THE FACES are about 3-2 by 8 inches—the most convenient size for reading and preservation.

THE TYPE is Minion, easy on the eyes. THE PAPER is heavy and of a heantiful white color.

THE FIRST HOOK, Robinson Crusce, was ready about April 1st. One of the others will follow every two weeks and he mailed to subscribers as soon as published.

RELIABLE.—Messrs. Rowell & Co., publishers of the American Newspaper Directory, writing of the publishers of FARM AND FIRESTOR, say, "they are accredited by the Meicantile Agencies with a capital of a Million dollars, and are too well known and too much respected to make it worth while to make any statements which are not true." Therefore sil are sure to get the above books if careful to direct letters correctly.

MONEY SHOULD BE SENT by Post Office Money Order or Registered Letter, addressed to

### The Rev. W. F. Clarke.

On this page we give our readers an engraving of the Rev. W. F. Clarke, which will be recognized by those who know him, as a very good likeness.

Mr. Clarke is an Englishman, and was born in the city of Coventry, March 31, 1824. He was educated for the ministry, having been one of the earlier students in the Congregational College of British North America. Before going to college he spent a comple of years on a new Canadian farm, and there contracted that love of agriculture, which has been with him a strong, if not a "ruling passion" ever since.

Mr. Clarke bought his first hive of bees in the spring of 1864, with a view of investigating the secrets of apiculture, in order to fit himself to write on that branch of moral economy. In

AMERICAN BEE JOURNAL, and, act- of yore. ing under the advice of leading beekeepers, effected its removal from keeping as a business, but wholly as

at the Apicultural conventions held of professional and literary labor. In at Indianapolis, Dec. 21, 22, 1871, and June, 1880, he became pastor of the at Cincinnati, in Feb., 1872, out of Congregational Church, in Listowel, which by the harmonious blending of Ont., where he divides his time beeonflicting interests, the North Amer- | tween the care of his flock, the Agican Bee-Keepers' Association, now ricultural Editorship of the Western so prosperous, was organized. Mr. Advertiser, and Montreal Witness, and Clarke held the Presidency of this occasional contributions to a variety body for 2 years, and, until laid aside of periodicals. Of late he has reby ill-health for a time, was one of its sumed work on the American Ber most active members and officers. Journal, and we hope hereafter to On the death of the lamented Samuel | see his face and hear his voice | at our Wagner, Mr. Clarke purchased the annual conventions of bee-keepers as

Mr. Clarke has never practiced bee-

from which city the first number was and interest, 24 colonies being the January of that year, he had under-issued in Jan., 1873. In the December most he has ever had at one time. taken the editorship of the Canada following, the proprietorship of the Farmer, owned by the late Hon. G. JOURNAL passed into its present Brown, and published in connection hands, but Mr. Clarke remained the with the Globe newspaper, the leading responsible Editor for more than a daily and weekly of the Dominion. | year subsequently, and continued to He continued editor of that paper for 5 years, and during that time pursued the study of apiarian science with unlarging interest. He was one of the honey extractor, and other improved appliances to the bee-keepers of Canaphiances to the Dominion of the contribute to its columns for some time afterwards, until sickness compelled his retirement from that and all other literary work. Happily he betook himself to the recuperative influences of farm-life, regained his health, and for more than a year past has been able to perform his full share.

G. M. DOOLITTLE.

I thas been the worst time for queence in the Weekly BEE JOURNAL, that most of the read-can having a prosperous season, and I wish it was so with all; but so far, little honey has been obtained by the bees in Onondaga county, N. Y., and reports of like character are companied by the bees in Onondaga county, N. Y., and reports of like character are comping in from many portions of this betown that all does not always go smoothly in been all other literary work. Spring opened with us about side to the picture, but deem it no far, little honey has been obtained by the bees in Onondaga county, N. Y., and reports of like character are comping in from many portions of this back. Spring opened with us about

Washington, D. C., to Chicago, Ill., a matter of scientific investigation

For the American Bee Journal

### The Honey Crop in Central N. Y.

G. M. DOOLITTLE.

April 20th, at which time we found the winter and spring had worked more ruin to our bees than any season ever known before. known before. After getting things in order, I found the best I could do was to unite my bees down to 30 colonies, for they stood as follows: 1 good colony, 10 fair to medium, and 40 weak to very weak. After reducing all to 30 in number, many of them were still found to be quite weak, and had to be helped by other colonies. Still, al-though regretting the great loss, I have been thankful it was no worse, when been thankful it was no worse, when I received so many reports from parties who had lost all. Pollen came in quite plentifully about May 1st, from elm and soft maple, when the work of building up our bees commenced in earnest. On the 12th, golden willow gave the bees a taste of honey, from which our best colony gave us 5½ lbs. of extracted honey. Right here I wish to say that I know of no tree or plant which our best colony gave us 5½ lbs. of extracted honey. Right here I wish to say that I know of no tree or plant that helps the bees more than the golden willow. It comes so early, giving the first honey, which seems to give the bees new life and activity. There are probably 50 smallish trees in range of our bees, and they generally make a gain of from 5 to 9 lbs. per colony of good honey from it, while in bloom. We value this willow more from the fact that it does not incline to throw up spronts or shoots as most

in bloom. We value this willow more from the fact that it does not incline to throw up spronts or shoots as most of the willow tribe does, but grows into a tree similar to the basswood, although it never attains a large size. It grows readily from cuttings, and will thrive in all moist (not wet) places. But to return: May 21st apple trees commenced to bloom, and as the weather was generally good, our best colonies stocked up with new honey; the best one (which I concluded to work for extracted honey) giving 19½ lbs. The weather during May was extremely warm, the mercury going as as high as 92- in the shade.

June 1st, owing to the continued warm weather, white clover began to open, and as the ground was thickly covered with it (as a result of the favorable winter for all herbage), I contidently expected as good a yield of honey from clover as in 1877. But alas! on June 4th the weather changed, and it has been cold, cold, rain, rain, ever since. On June 6th there was a alas! on June 4th the weather changed, and it has been cold, cold, rain, rain, ever since. On June 6th there was a frost which killed grapes, and even our strawberries after they were nearly one-half grown. On the 14th we had another frost, with a week of cold, cloudy weather, so the bees scarcely looked out of their hives. It is warmer now, but we have rain nearly every day. every day.

1 have taken 28 lbs. of clover honey

from the colony for extracted honey, and if it should come warm and dry soon, a few days' good yield might yet be obtained; otherwise, basswood is our dependence for honey for 1881.

It has been the worst time for queen-

I fancy I hear Mr. Miner and Mr. Thomas saying, "We told you so, when you were writing upward ventiwhen you were writing upward venti-lation, and a good season with your dwindled down colonies, and now you find it as we fold you." Well, gentle-men, you did well in your discussion of the matter, and I am willing to let it drop where it is, for if I should write further trying to prove myself correct, we should only get into a concorrect, we should only get into a controversy instead of a friendly discussion. A friendly discussion benefits all, as it gives both sides of the matter under consideration; but a controversy benefits no one, and is anything but tasteful to the readers of our much esteemed American Bee Journal. Borodino, N. Y., June 27, 1881.

### Why Did Mr. Root's Bees Die?

L. L. LANGSTROTH.

[The following article is taken from the July number of Gleanings in Bee-Culture. Mr. Langstroth wrote Mr. Root 5 questions, which, with the answers, are given in the article. The whole article will be read with inter-

Your heavy losses in bees affect me painfully. While I admire your cheerful spirit under such reverses, I know that the failure to winter your bees is that the failure to winter your bees is much harder to bear than the mere pecuniary loss. I speak from a vivid recollection of past experiences. Before I discerned what precautions were necessary for wintering bees successfully in movable-frame hives. I more than once found myself in the spring in a plight almost as bad as your own. I can fully indorse your explanation of some of the reasons why your reverses have been so much greater than those of some large bee-keeper in your neighborhood. much greater than those of some large bee-keeper in your neighborhood. I often met with great losses when my apiary was managed chiefly for the sale of Italian queens. At the close apiary was managed chiefly for the sale of Italian queens. At the close of a poor honey season my apiary often had many weak colonies. The temptation to winter every such colonial and the same state of the same state. ony which had a good queen was very great, as the demand at high prices for such queens in the spring was usually greater than could be met. It was only the fact that my look met. It was only the fact that my fo-cation was a poor one for honey, and that I could get large figures for nearly all the queens that I could rear, that at all justified my course. If in addition to the queen business, If in addition to the queen binshess, the selling of bees quite late in the season by the pound had been practiced, the condition of my apiary after an unusually cold winter and late spring would probably have been very similar to that of your own.

I give some comments on your replies to questions which I sent to you.

1. "Did you spread the combs fur-

"I did not. Although recommended, so far as I know it has been mostly abandoned."

Mr. Harrison, of Buffalo, first called attention to the importance of keeping the combs in which the bees cluster for winter 3g of an inch further apart than the natural breeding distance. In the old box hives there are usually spaces in which bees can cluster invaled here from the state of the space of ter in much larger numbers than in movable frames properly spaced for the working season. In the very cold winter of 1872-3 I wintered in the open winter of 1872-3 I wintered in the open air in hives only 78 of an inch thick, until February, a number of colonies which were estimated not to have over 2 quarts of bees per hive. All the bees of a hive were placed between 2 combs full of honey, which were kept nearly 3 inches apart, and they formed a single cluster shaped like in formed a single cluster, shaped like a ball. If the combs of these colonies had been left in their summer position, no amount of chaff used in any fashion could have saved them. Mr. J. S. Hill, of Mount Healthy, O., who

the combs.

"Did you make winter passages in the combs?

Perhaps half of the combs have ter passages. I have never been winter passages. I have never been satisfied it made any material differ-

In this you differ from those who have had the best success in wintering bees. Mr. Hill, for instance, never neglects this point, and 1 am satisfied that the power of passing from comb to comb through the heart of the warm cluster, besides saving the lives many bees, greatly encourages ly breeding. In the old box hive early holes around the cross-sticks for the support of the combs give the best of winter passages.

3. "Did you place burlap or any other non-conductor of moisture over

"We used burlap, wood mats, and enameled sheets, but saw no differ-ence in favor of either."

Whatever the material used for conmining the bees below, it should, as a matter of course, permit the ready escape of superfluous moisture. weak colonies in very cold winters, this is a point of great importance.

4. "Did you give the bees a good space above the frames for clustering

A part of them, perhaps nearly 1 had an empty frame, or a frame of stores placed over the cluster. Our Palestine bees went into this upper chamber and starved, having plenty of stores below.

Reference to the back volumes of the American Bee Journal show that Bickford's quilt (afterward im-proved by you) is credited by him to the successful experiments which he witnessed in my apiary. I discarded the honey-board in wintering, using, instead, woolen rags, old carpets, etc. through which all superfluous moisture could pass, while sufficient animal heat was retained, explaining at length that the principle was the same as using suitable bed covering to keep ourselves dry and warm in cold weather. I have always regarded the elucidation and application of this principle as a great advance in practi-cal bee-keeping. The letters of Hnprinciple as a great advance in practi-cal bee-keeping. The letters of Hn-ber, published only a few years ago, show how much his bees suffered from dampness; and before I so fully expounded my ideas in the London Journal of Horticulture, our English friends found that they could not use wooden boyes with any satisfaction. wooden boxes with any satisfaction. My plans, as seen by Mr. Bickford, and very fully described in the Amerthis free escape of moisture without too much loss of heat, but especially provided an ample warm space for the ees above the frames, so that the luster could contract or expand at bees above the frames, so that the cluster could contract or expand at will. This saved the lives of many bees which, in very cold weather, even with the best winter passages, often failed to regain the center ter, and died because they could not keep up the necessary heat.

I believe that, even in such a winter as the past, that with winter passages, combs properly spread apart, and a warm clustering space for the aforesaid purposes, bees could be better wintered in the open air in hives <sup>1</sup>g of an inch thick, than with any amount of chaff above, around, or below them, where these precautions are ignored; for in sunny weather such thin lives will warm up so as to dry out and allow the bees to reach their stores, low the bees to reach their stores, while the chaff hives may centain cold and damp as a cellar. I will send you, in due season, an impatented device used by Mr. Hill, for securing a warm nest above the clustered bees, which answers the end better than any one I answers the end better than any one I have yet seen. Is there a man in all our northern country who can claim equal success with Mr. Hill in wintering bees? It hardly need be said J. S. Hill, of Mount Healthy, O., who that he is a pattern of skill, energy, wintered last season 112 colonies with- and promptness. He has made his ont losing one, and who has wintered bees pay in a region where I think it on an average 80 colonies a year since is ordinarily more difficult to secure

more favored northern locations.

5. "Did you feed your bees for winter with a mixture of grape and cane sugar?"

"Only a part of them, as 1 stated on page 278."

I think your losses were owing in part to your use of grape sugar. It is not at all necessary that grape sugar should contain any impurities to make it a very hazardous tood in such a winter not sugar as we have just had winter and spring as we have just had. From its low sweetening power as compared with honey or cane sugar, your bees which used it were forced to eat more than they otherwise would have done, and thus to suffer from a greater accumulation of feees. You say, "Had our usual April weather come on, we should probably have saved about 50 colonies that we lost," last not highly meabuild. That min Is it not highly probable that, with the weather just as it was, you might have saved many of those colonies, if they had not been forced to succumb under the excess of feces produced by the undigested starch which so largely the undigested staren which so largely enters into the composition of grape sngar?

In noticing my account of Mr. D. McCord's heavy losses from wintering

his bees on a syrup largely made from nis bees on a syrup largely made troil grape sugar, you express surprise that he "should have done so foolish a thing;" but you published last fall his account of the mixture he proposed to feed, without a word of disapproval or caution. You also say, in June Gleanings, "I have never advised the use of grave sugar for wintering." use of grape sugar for wintering. Surely, friend Root, your memory i at fault in this matter. In Gleanings for October, Isso, page 489, Mr. Crowfoot, in a letter to you, says, "Will you please tell me what you would feed hees that have got just about half enough honey to carry them through the winter?...I have about 700 colo-nies of bees, with about half enough honey to winter on.

To this you reply."If I had 700 colonies with half enough stores for win-ter, I would supply the deticiency with trames of candy made of coffee A and best grape sugar in about equal proportions. If it is less trouble to and best grape sugar in about equal proportions. If it is less trouble to you to feed in the form of syrup, make the syrup as described in the "A B C."

They may die with this feed, but they may also die with natural stores, as past reports fully demonstrate; but I think, if properly done, such stores are after for winter as natural I think, if properly uone, such stores are just as sate for winter as natural stores....Very likely the grape sugar that is made now would be sate of itself; but to be sure of being on the safe side, I would use half coffee A, as

Certainly you have sometimes cautioned your readers about grape sugar as a winter bee-feed; but there can be no doubt that, as in your reply to Mr. Crowfoot, you have fully indorsed it as a safe food to enter at least ½ into the preparation of winter stores. When you review carefully all your utterances, 1 believe not only that you will admit this, but that, with the ex-periences of the last winter you will periences of the last winter, you will condemn its use for winter stores so plainly that no one can mistake your position. Perhaps it needed such a winter and spring as we have just passed through to demonstrate that no prudent bee-keeper can afford to use grape sugar as a winter feed in any proportions however small.

You say, "I am very sorry that grape sugar is used for bad or dishongrape sugar is used to had of disanonest purposes; but even if it is, I cannot see why this should be a reason why we should not use it while rearing queens, and bees by the pound." So enormous are the frauds practiced by the adulteration of our commercial enorms by grape, sugar and disasteries. cial sweets by grape sugar and glu-cose, that it seems to me that bee-keepers should lend no countenance keepers should lend no countenance in any way to those who make them. Already such suspicions have been awakened as greatly to curtail the sale of pure honey at renumerative prices. On sellish motives alone, those who deal in honest honey, and

1868, without the loss of one, spreads one pound of surplus than two in the flint against articles made almost ex-

finit against articles made almost ex-clusively for bad purposes.
You say that the Buffalo Grape Su-gar Co. have produced a sugar which "is as pure and simple a sweet as the best grades of maple sugar." Have you any warrant for such an assertion? and even if you had, is it right for you to call down a blessing from beaven upon a company which is making such enormous profits by selling their products almost exclusively to men who, by their adulterations, are cheating the poor man in his honey, candies, syrups, and sugars? If ever grape sugar and glucose are made as pure as the best maple sugar and syrup, and it becomes desirable to mix them with our other sweets, let them be offered at reasonable prices under their own names, so that we can do our own mixing; or let the mixtures be sold such for what they are worth.

Friend Root, you have gained a host of warm friends by your candid ad-mission of mistakes into which you when they have superseded what has cost you much time and money; nor have you, from a false pride of consistency, been wont to persist in advosistency, been wont to persist in advo-cating what time has proven to be er-roneous. It seems to many of your best friends, however, that on this grape sugar question you have acted under the influence of prejudices which have strangely warped your bet-ter judgment. We cannot question your sincerity, and only hope that, when you weigh well this matter in all its bearings, you will feel that you ought to enlist the great influence of your name and journal against a busiyour name and journal against a business which, as it is now conducted, enables unscrupulous men to commit such monstrous frauds.

Your sincere friend,
L. L. LANGSTROTH.

Mr. A. I. Root's reply to the above article is as follows:

May the Lord bless you, my kind friend, for your frank and faithful way of taking your old friend to task. I certainly had forgotten giving the advice you quote, and felt sure that I had never said anything favorthat I had never said anything favor-ing grape sugar so strongly for win-tering. At the same time, I have no reason for thinking it any worse than stores of honey. More than 10 years ago we had abundant proof of the ad-vantages of scaled stores of coffee A vantages of scaled stores of coffee A sugar syrup over natural stores, and the past winter has abundantly corroborated it again. I have always sold grape sugar under its true name, and, as far as I know, so also have the manufacturers of whom I bought the manufacturers of whom I bought it, and also those to whom I sold it. If the experience I have had of the world is worth anything, I am sure I am right in feeling that the unjust (and I might say foolish) prejudice against grape sugar is going to pass away, and it will come out and stand as safely as a valuable product from Indian corn as does starch. Evidences of this are now scattered throughour papers. Notwithstanding this our papers. Notwithstanding this conviction, as grape sugar seems, without question, to "make many of my brothers to offend," I will, for the my brothers to offend," I will, for the present at least, drop it. I feel sure we shall winter better next winter, but I think it will be greatly due to something more important than the substitution of granulated sugar for grape, viz: giving the bees more of my brains individually. As an excuse and aplogy to our readers for the inconsistencies friend I. has so kindly consistencies friend L. has so kindly consistencies friend L. has so kindly pointed out. I would say that I am getting to have a great business on my hands. In my zeal for getting boys and girls to work (that immortal souls may be saved), a great traffic has opened in supplies. Brains are so much needed at every turn, and so many points are gone over in a single day, that I am no longer able to remember what I have written and advised as I did a few years ago. In vised, as I did a few years ago. In the next edition of the "ABC," and also in our price list, I will, at least for the present, advise against the

For the American Bee Journal.

### Observations about Several Things.

G. W. DEMAREE.

Mr. Moon, in his criticism on my article on the purity of the Italian race, disposes of the troublesome question of "color" in a very convenient, if not a very logical way. He tells us, in language which seems to indicate the loss of patience, that the idea that color has anything to do with the purity of the Italian " is all bosh."

I have to say that if Mr. Moon will point out a single case in all animate nature wherein "color has nothing to do" with the identity and purity of the species of animals, fowls, and insects, I will confess that he, at least, has made a new discovery. If he should made a new discovery. If he should tell us about a white blackbird, or of a black yellow-jacket, would there be any "bosh" about that?

any "bosh" about that?
The Italian is classed with the yellow or light-colored race of bees. Now if we discover bees among them as black as night, or any material variation in color, do we not reason logi-cally when we conclude that it is an ont-cropping, the result of mixture of blood? We prefer reason to mere as-sertion. The 3-band test of purity, though perhaps the most reliable of any single feature yet discovered, is, nevertheless, very masatisfactory. Are nevertneiess, very misaustactory. Are we to accept as true the absurd and illogical doctrine, propagated by some of our vendors of queens and bees, that a queen whose progeny must be filled with light-colored honey and placed upon a window in order to exhibit the faint outlines of 2 pragings. hibit the faint outlines of 3 precious bands, is just as pure as a queen whose progeny shows the orange-colored 3 bands under all circumstances? I, bands inder all circumstances; I, for one, do not accept it. There are degrees of purity, and when we admit this much, we admit, in fact, that the race as a whole is not pure in the sense of being unmixed. I wish it understood that I do not value the Italian bee, because of its sporting character,
—but rather the more while I may
make my own selections.

"Dysentery" is a trouble rarely ever

seen in this climate, apparently because our bees can usually take a flight once in every week or two. I have never seen but two cases that amountnever seen but two cases that amounted to anything, and one of them was caused by approaching starvation. The colony was cured by feeding. Dr. Southwick's "starvation theory" is just as reasonable as that of the other bee-doctors who attempt to find just one cause for the disease.

I am sorry that Mr. Heddon asserts that he want to wood

I am sorry that Mr. Heddon asserts that bees will attach the comb to wood separators, because it indicates he writes about some things about which he knows but little. I have used wood separators for several years, made of poplar, 13 inch thick, nicely dressed, and have to see the first combiniumed by being attached to the separator. I prefer wood to tin, because the former absorbs the moisture, while the latter condenses it.

Mr. Doolittle's advice to breed from the queens whose colonies produce

Mr. Doolittle's advice to breed from the queens whose colonies produce the most honey is a good "theory," but, in my opinion, poor practice. Condition has a great deal to do with the working capacity of a colony of bees. In 1878 I had a colony of soealled dark Italians, which ran right off from my pretty light-colored bees, off from my pretty light-colored bees, and I was ready to breed from her exclusively. Well, in 1879 she was beaten by 2 of her light-colored sisters of the same age, and I changed my mind. I have found that all the prodigies in the way of queens which I have had the good luck to own were daughters of my fine selected queens, and not one of them were enable of and not one of them were eapable of G. transmitting her energy to her queen the posterity with any certainty. I see no reason why we should discard the established rules of stock breeders, *i.e.*, breed from the purest stock rather than from accidental specimens.

One of my queen-rearing colonies "balled" and killed their queen when she returned from an unsuccessful bridal trip, the other day.

Christiansburg, Ky.

For the American Bee Journal.

### My Report on Wintering.

D. A. JONES.

As I could not give my personal supervision to the preparing of my colonies for winter last year, I consider I have been very fortunate. My men have all been trained by myself, yet I prefer to look more closely after pre-paring them than I was able to last fall. At one of my bee farms, about 3 miles north from my home apiary, William Cause, manager, there were 162 colonies placed in the sawdust wintering house, and 151 put out in the spring in good condition; but 4 of those that died, starved; they were Palestine bees, and the queens had bred until all their stores were gone; 2 were drone layers, 1 a very small nu-

2 were drone layers, I a very small nucleus, and the others were the poorest ones, especially in young bees.

At my bee farm, northeast of my home apiary, about 4 miles distant, where there were over 200 colonies, 9 died, and 3 were nearly gone, so that they had to be united with others.

Our house apiary, where there were nearly 300, the loss was somewhat greater, but that was owing to selling so many bees late in the fall, and

so many bees late in the fall, and having only old bees in the hives. Then to make matters worse, about 50 queens arrived from the East, very late, after winter had only a second to the fall of the second to the fall of the winter had only in the fall of the fall ate, after winter had set in, and in some instances, I took a comb from each of several colonies, with bees to form nuclei for them; others we diviform nuclei for them; others we divided, and in still others we removed the old queens and introduced the imported ones, thus disturbing and breaking up the cluster of the colonies, without giving them a subsequent flight for many months: they

suffered very much.
All good colonies that were not tampered with late, came through safely, where they had stores enough. I hope to be able, at some fulure time, to give more particulars as to my method of wintering. I always try to make all my preparations in the fall, and give them a "good letting alone" in

winter.

My bees now are booming, but it is so cold and windy upon the Georgian bay, that I have experienced great difficulty in getting queens mated there. I have now from 100 to 200 colonies devoted to rearing queens, and will soon have more than 200. The Palessoon have more than 200. The Palestine queens will be in great demand, as soon as reports are given from many disinterested parties. I find that those from some parts of the Holy Land far outstrip others.

Now, Mr. Editor, I will send you one to keep in your apiary to test it, and show it to your visitors.

The Rey, L. L. Langstroth, Mr.

show it to your visitors.

The Rev. L. L. Langstroth, Mr. Muth, and others, have them to test. If you and some of our other first-class bee-keepers test them, we shall arrive at the truth as to their merits. It handsome bees is one of the qualities required, they are ahead; and in prolificness they can, I think, beat the world. Mr. P. P. N. E. Pelissier, of Quebec, reports 7,580 eggs laid in 24½ hours. I will send you another letter hours. I will send you another letter from Mr. Benton next week.

Beeton, Ont.

For the American Bee Journal.

### Transferring Bees from Box Hives.

OSCAR F. BLEDSOE.

Having had some experience in transferring. I will give my method, being led to give my thoughts on this subject by reading an article from Mr. subject by reading an article from Mr. G. W. Demaree, in the JOURNAL of the 29th of June, in which he seems to think he has reached the ne plus nltransfer at any time when there is a flow of honey. I fill the lower story of the Mississippi bee hive (having dubbed the hive I use with that name) with 9 frames, either filled with empty comb or comb foundation, or having good starters. I put on a second story, and having taken 9 frames filled with honey and taken 9 frames filled with honey frames filled with frames filled with honey frames frame of dry frame of the drone frame of dry frames frame of dry frames frame of dry frame of dry

brood from 1 or 2 of my strongest colonies, fill this second story with same.

I brush off the bees from these frames containing brood and honey, and leave their places in the hives from which they are taken vacant. I provide my the provide my be given to the other colonies. containing brood and honey, and leave their places in the hives from which they are taken vacant. I provide my-self with a smoker, dull hatchet or cold chisel to cut mails, mallet, lugge feather (a single feather is better than a bunch), a vessel covered by a sheet feather (a single feather is better than a bunch), a vessel covered by a sheet, and a knife. I put the frame hive prepared as above in place of the box hive, without any ceremony, only blowing in enough smoke to keep the hees from flying at me. I lay the box hive on one side, the lower or open part turned toward the frame hive, and place boards so that the bees can crawl into the frame hive easily. I then commence to cut the box hive apart very rapidly, taking the combs as fast as the bees can be brushed from them, and putting them in the from them, and putting them in the vessel at my side. As soon as all the combs are taken and the bees brushed combs are taken and the bees brushed off, occupying only a few minutes, the transferring is complete so far as the box hive bees are concerned. The advantages of this process are, 1st, its rapidity—no previous "knocking first to one side and then to the other," no "waiting a little while for them to fill themselves with honey;" 2d, its safety and certainty, inasmuch as to add to the confusion and dismay of the transferred bees, no patching up is inforced on them—no combs with dripping honey are given them to invite robbers, and if the equivalent of their brood and honey are put in their new home, instead of being checked, they are actually bettered in their condition. I will add that if I can catch the below are actually here a trained to the condition. tion. I will add that if I can catch the black queen and have an Italian queen or queen-cell to spare, I kill her and thus Italianize and transfer at the same time.

After driving the black bees into

After driving the black bees into the frame hive, I take the vessel con-taining the combs to a close room, and having transferred the combs to frames, put the frames in the hives from which the frames of brood and from which the frames of brood and honey were taken to give the black bees. Fixing up these combs and "handling" the dripping honey often gives a new impetus to these last named colonies, so that transferring by this method, if not an advantage "all around," is, at least, not a decided check. I use no tin-tixings, thorns or pegs, or clasps to hold the combs in the frames, but simply coarse cotton thread, or better, the common paper package-cord of the stores, that the bees can cut easily and remove from hees can cut easily and remove from

their hives Grenada, Miss., July 3, 1881.

Rural New Yorker.

### How to Rear Good Queens.

W. Z. HUTCHINSON.

As queens are liable to die, or to become impotent, and as the increase of colonies require queens, it is necescolonies require queens, it is necessary for the beginner to learn how to rear them. Preparations for queen' rearing should be commenced as early as the weather is warm enough for the bees to fly every day. The best queen in the yard—that is, the one whose colony, all things considered, has given the best results—should be selected as the one from which to rear others. Some other colony, containing a choice queen, should be allowed to rear the drones. A frame of drone comb should be placed in the centre comb should be placed in the centre of the brood-nest, and the colony stimulated by feeding, in order to have drones flying from this choice queen as soon as possible. Inferior queens can usually be prevented from rearing drones, by allowing them no drone comb. As soon as some of the drone

This queenless colony will immediately commence building queen-cells, and as there is no brood in the hive except that from the choice queen, all the queens will necessarily be her daughters. Cutting off edges of the comb, or cutting holes in the same, where there are eggs or just hatched where there are eggs or just natched larvae, will almost always insure the building of queen-cells in such places. It will be noticed that the queens are started from eggs or from just-hatched larvae, as the bees are given no other, and so are fed the "royal jelly" from the first. the first.

the first.

In a week the queen-cells will be sealed over, when the apiarist should form his "nuclei." A "nucleus," in hee-keeping, is a colony on a small scale—for the purpose of rearing queens. A nucleus hive may be nothing more than an ordinary hive, with the space contracted by a division-board to the capacity of 2 or 3 frames. By using 2 division-boards and having an entrance at each side of the hive, one hive can be made to accommodate. one hive can be made to accommodate

2 nuclei.

After the hives for the nuclei are all prepared and placed upon their stanos, then the hee-keeper should go to different hives of the apiary and take out 2 or 3 frames for each nucleus (at least one comb in each nucleus should contain brood), till there are as many nuclei prepared as there are queen-cells to dispose of. The bees should be left adhering to the frames of the property of the contains the conta of comb, only one must be certain that no queen is removed. To be sure of this, do not take the frames away until the queen is found. I sometimes shake off into the nucleus the bees from one or two more combs, so that, even after the old bees have returned, there will yet remain a sufreturned, there will yet remain a sur-ficient number of young bees. The next day after the nuclei are formed, each one of them should be furnished with a queen-eell. In cutting out the cells a small piece of comb should be cut out with each cell, and great care

cut out with each cell, and great care should be taken, both in cutting them out and in fitting them into the comb in the muclei, not to press or dent them in the least. In 2 or 3 days the queens will hatch, and in about 10 more days they will be laying.

After cutting out all the queen-cells from the old hive, another comb of larvæ can be given it and another lot of queen-cells obtained, or, if the apiarist has a sufficient number, he can leave one queen-cell, which will soon furnish this colony with a vigorous queen. After a laying queen has been removed from a nucleus, another queen-cell can be inserted, and in 10 or 12 days it will again have a laying or 12 days it will again have a laying

# THOMAS C. NEWMAN.

EDITOR AND PROPRIETOR,

CHICAGO, H.L., JULY 43, 1881.

😰 On Saturday, July 2, after the Bee Journal of last week was on the press, the bees in our great hive of nature were thoroughly alarmed, because of an attack made upon the person of its chief. Rad the intruder been within reach of the infuriated bees, they would quickly have stung him to death. The person attacked was Pres. Garfield; the assassin was a notorious fanatic by the name of Guiteau; the weapon used was a large revolver; the work was clumsily done, at the depot in Washington, as the President was about to take the train. —but the President still lives, to rejoice the hearts of fifty millions of freemen. The messages of condolence from all the civilized nations of the world, present a beautiful and affecting spectacle.

Suspended. — The small monthly, "Young Hearts and Little Hands in Apiculture," that was published by J. W. K. and A.G. Shaw, two clever boys, at Loreauville, La., is no more! In its June number, just published, the editors give their valedictory. It has lived just two years. We expect to hear from the "Shaw" boys at something greater, if life be granted them to become men.

The Minnesota Agricultural and Mechanical Fair and Exposition will be held at Minneapolis, Minn., September 5 to 9, 1881. It promises to be a very attractive Fair. We desire to engage some good judge bees and honey who may attend that Fair to make a brief report of such for the BEE JOURNAL, and will furnish 2 season tickets and the necessary documents as our reporter. Who will accept this proposition?

regional Togel succeeds the late Hern Andreas Schmid, as editor of the Bienen-Zeitung. The Zeitung is now in its 37th year of publication, and is the oldest bee paper in the world. We extend our congratulations, and welcome its new editor, Hern Vogel, whose acquaintance we were very glad to have made at the Austro-German Bee Congress, at Prague, in 1879.

The Northwestern Convention at Chicago.—It will be observed, by reference to our local convention directory, that the time for the meeting of the Northwestern District Convention has been postponed till Oct. 25 and 26, 1881, instead of Oct. 11 and 12. It was found other Societies were entitled to the latter days for their Conventions, by priority, and hence the change. We think the change a good one, as it well enable members of local Societies are more founded as the cultural papers of the world. It is will enable members of local Societies are more formular to you. I think, of my fruitless and trying search there. You will see from what follows why I have no more to show for the time, money and trouble I have been obliged to use in testing this matter. Immediately upon my arrival in Ceylon from Java I proceeded to one of the jungle districts where I had been informed I would be likely to secure some of the large bees. I had a tory, that the time for the meeting of will enable members of local Societies to perfect arrangements for a general a review of the summer's work.

### Mr. Langstroth on Glucose.

It is with the greatest satisfaction we give space to the able and practical article from the pen of the Rev. L. L. Langstroth, to be found on page 218. His strictures on the uses and abuses of glucose are exhaustive and convincing, while the whole article will well repay careful and studied perusal. Particularly worthy of attention are the following sentences: "So enormous are the frauds practiced in the adulteration of our commercial sweets by grape sugar and glucose, that it seems to me that bee-keepers should lend no countenance in any way to those who make them....On selfish motives alone, those who deal in honest honey, and those who have the control of our bee periodicals, should set their faces as a flint against articles made almost exclusively for bad purposes.....If ever grape sugar and glucose are made as pure as the best maple sugar and syrup, and it becomes desirable to mix them with our other sweets, let them be offered at reasonable prices under their own names, so that we can do our own mixing: or let the mixtures be sold as such for what they are worth."

It is gratifying to know that Mr. Langstroth's able arguments have not been altogether in vain, for the closing sentence of Mr. Root's rejoinder indicates that he is "almost persuaded," although his promise is made with an evident mental reservation. This sentence reads: "In the next edition of the "A B C," and also in our price list, I will, at least for the present, advise against the use of grape sugar."

It will be observed that Mr. Langstroth takes the same view of grape sugar and glucose as a commercial product, that we advocated long ago, and is as amalterably opposed to its being offered and sold for anything else. We have always assumed that any article of real merit has nothing to fear from being honestly trafficked, while a product possessing no real merit should not be imposed upon the public under an assumed name. No amount of commercial enterprise can ever justify dishonest dealing.

Fraternal Appreciation.—There is, perhaps, nothing more indicative of a paper's real merit than the frequent appearance of articles accredited to it, and nothing more encouraging to an editor than the receipt of private encomiums like the following, from those who "know whereof they speak:

The Rural New-Yorker, 34 Park Row, N. Y. J. T. G. NEWMAN, Esq.—Dear Sig

Allow a word of congratulation on the Allow a word of congratulation on the work you are doing for apiculture by means of your paper. Its able discussions of all topics relating to the apiary have won for it an enviable reputation among bee journals. Success to you! Fraternally,

JAS. W. DARROW.

unnecessary to return the compliment, as the Rural is read and appreciated attendance, and give opportunity for wherever scientific and intelligent agriculture prevails.

### Explorations in the Orient for Bees.

The following very interesting letter from Mr. Frank Benton, will be read with much interest. The results of his expedition are not flattering. After the expenditure of a small forture, many months of valuable time and enduring hardships, that but few men could or would endure: the result is that Mr. Benton has a colony of small bees that are " not valuable, and a colony of Apis dorsata that are in such a condition as not to be "likely to reach its destination, Cvprus, alive." The result is anything but flattering, and the contemplation of it by Mr. Jones must be rather discouraging. Nevertheless let us hope that there may be some result that will, in a measure, give some solace for his many expenditures.

Mr. Benton's letter is as follows:

Steamer "Djemnah, Red Sea, May 3, 1881.

FRIEND JONES: No doubt you look for a long account telling you that I have with me scores of colonies of bees of various kinds and races, some of them far more valuable than those we now cultivate, and 1 should be very glad indeed to be able to give I have with me but two races of bees and but two colonies of Apis dorsata, the Great East India Bee, and one of Apis floreu, a race of very small bees, curious, but not valuable, and furthermore, I cannot say that the colony of large bees is in such condition as to be likely to reach its destination

Now, notwithstanding this very meagre report, I am justified in say-ing that I have exerted myself to the utmost, and have risked my life and health times without number, feeling that I must do the work I had undertaken if it were a possible thing. The fact is, I have undergone hardships, and have exposed myself to the attack of disease as well as to the dangers of instantaneous death in a numof ways, to such an extent as I could by no means be induced to do again, even for a very considerable sum. As it is, my only penalty has been a severe tropical fever—the jungle fever of Ceylon—which afflicted me during 10 days, occasioning me much suffering; some personal expense for clothing necessary to the expense for ciothing necessary to the journey as well as others spoiled by climatic influences. It was an utter impossibility for me to reimburse the money the journey has cost. I shall likely return to Cyprus with £12 to £15, but if I had had a year's time in the East, and had found very valuable treat. I do not believe I shall have a south believe I shall have the shall be not believe I shall have the shal bees 1 do not believe I could have paid expenses.

aroused much interest in Ceylon while I was there. Even with the utmost economy, traveling and getting along oftentimes in such a manner as the Europeans living in the East consider "mean," the expense of such a sider 'mean, the expense of such a journey is immense, and then it takes so long to accomplish a little. This is partly owing to the character of the people living there, and partly to the climate, to which no European or American dare expose himself as he would get home. would at home.

1 will endeavor to give a short ac-

count of my journeyings since leaving Java, having told you, I think, of my

cure some of the large bees. letter of introduction to one of the native chiefs—the head one of this district, and a man more interested in side of a shelving projection, quite district, and a man more interested in side of a shelving projection, quite bees than any other native—perhaps I inaccessible. Two or three could, at

might say pcrson, in Ceylon. This letter not only secured me his influence with the natives, but an invitation to remain in his home during all my stay in his locality. Within two miles of his home I saw the first colony, or, in fact, the first specimen of Apis dorsata which ever greeted my eves.

The bees were about 50 feet up a The bees were about 50 feet up a tree, on a branch to which it was not easy to get. Yet I climbed up so as to reach out and take off in my hands some of these wonderful bees, as large as queens, blue backs with shining blue wings and orange-colored bands under them. The comb, which was new, hung from the under side of the branch about 15 inches lang and the branch about 15 inches long, and the bees hung down 6 or 8 inches lower, looking like great wasp-colored hornets, beautiful but dangerous looking. As long as wholly undisturbed, or merely taken off from the bottom of the cluster with the hand they made no effort to sting, but a breath or the least jar, or even the scent of the body blown by the wind towards them irritated them much. When one had stung me or my clothing, I have forgotten which, the rest fast became wild with excitement, constantly whitzing out from the cluster in great anger. They kept coming in great numbers until I thought it prudent to retire. So down the tree I went, but my new-found friends accompanied me, as I went out into the jungle, "sticking closer than a brother." sticking closer than a brother. "sticking closer than a brother." I received many stings, yet found them not quite as severe as those of our bees, and the bees themselves were more awkward about stinging than are our bees. At last I got rid of them by killing and capturing them, but for any time others heat trying but for some time others kept trying to sting even when I was rods from to sting even when I was rods from the tree. With the help of some natives I secured this comb and a part of the bees, but the rascally Cingalese, being afraid of the bees, let their torches blaze up, although they had been cautioned against it, and thus hurned many of the bees. I could find no queen among the remainder, and of course soon played out. They took no care of their brood, so I was obliged to throw away the comb sobliged to throw away the comb shortly after. Strange to say, these bees, so ferocious in their forest-home, where nothing but smoke will bring feur to them, can be handled with no fear and without smoke, when in movable frame hives, provided they be not jarred or breathed upon, and no quick motions be made. Atter this I could get no more trace of the large bees near at hand, with the exception of a single colony very high up a large tree. I had learned that at night was the best time to handle them, if I wished the bees, and so in the night 1 climbed this lofty tree which stood on the side of a large, steep, rocky, and jungle-covered hill; but except a severe stinging and much fatigue there was no result of this venture, for the bees were in too dangerous a situa-tion. Many times when I had made long journeys to secure some, which had been found for me, I was disappointed by finding that some one had cut the combs for the honey, or that these were new swarms, only temporarily settled, and which had soon gone away.

An excursion of a few miles was a long journey, because it had to be made with an ox-eart, generally in the night to avoid the heat, and as much time would be lost in getting a cartman and getting him under way as it took to make the journey, or the way would be through almost impenetrable and rocky jungles where progress, on foot, even, was slow and laborious.

A trip to Bamberagalla (Apis dorsata rock), 22 miles with ox-cart and 7 miles rock), 22 miles with ox-cart and 7 miles on foot, showed me 14 colonies of the great bees, some of them containing a bushel of bees and having combs 4 or 5 feet long and 3 to 34 feet broad! But the lowest down was 50 feet from the rough rocky hed at the base of the mighty rock itself, and others were a broadest foot above as monthly note.

great risk, be gotten at; we crept in an ox-eart to where I could get into the cleft of the great rock, aseended a slanting pole 30 feet, then built a perpendicular ladder of poles and ratans 50 feet up the face of the rock, after which, hand-over-hand, we went up about 30 feet of very steep rock, perfectly bare and solid, our only hold being our bare feet and a single ratan attached to a boulder above. ratan attached to a boulder above. Once up here, we could go within 20 feet, along the ledge, to the place where most of the bees were located. I had put on my shoes, but the jar of the rocks made the bees angry, and I removed the shoes. I made the examination in the day-time, and at night we were to take the bees.

The men considered it so dangerous The men considered it so dangerous for me, that it was only by insisting upon it that I succeeded in accompanying them. I had little faith that they would get me the bees in good shape, as they asserted they would. In a fearful, blinding, thunder-storm these natives let one of their number down, by means of a rope, a very steep decline some 30 to 40 feet, where he slipped a sack over the comb and he supped a sack over the comb and bees and cut the former between the honey and brood; then he cut the honey from the rock and came up with his sack of broken comb and bees. He had a torch, and I suppose made such use of it as to prevent 15 of the hore from cut in its to prevent 15. of the bees from getting into the sack alive. Of course 1 protested, and to satisfy me they motioned that I should

go up next time.

1 followed them, and, behold, we went by a passage that I had not found before, right through the center of the great rock which rested upon the immense mountain-like block up whose side we had climbed. It was a most tortuous and difficult passage, but at last we emerged at the top and but at last we emerged at the top and found ourselves upon a rock about 10 or 15 feet square at the top. In a fissure, roofed by a small rock, and into which I could step, since it was, in fact, a smaller cave, was a colony of the great bees. With smoke I cleared the bees away a little and began fitting the combs into a box which we had hauled up with a rope. There were some 40 or 50 lbs, of very tine boney. I had a hox which would hold were some 40 or 50 lbs. of very line honey. I had a box which would hold about a bushel and a half, but after fitting 3 combs of brood and honey, and putting in about 23 of the bees, I was obliged to leave the rest to the na-tives. They feasted themselves upon honey and sealed brood, or, in fact, brood in any stage was a choice bit for them. The rocks were wet and slippery, so that it required great care in letting down the box of bees, as well as in moving about.

Thus, at midnight upon this great rock more than a hundred feet up in the air, with the moon and stars looking down upon us and the clouds below us, with 4 wild Cingalese hunters as my companions, their tawny skins invisible except where a single cloth, the size of a pocket handkerchief, was the size of a pocket handkerchief, was wound about them, and far from civilization, in a dense ebony forest. I got the bees I now have with me. It was not a very safe journey down the rock so slippery with the fallen rain, but it had to be made. I breathed freer when my feet were again on the ground below. We camped under the address of the rock and in the morning when my teet were again on the ground below. We camped under the edge of the rock and in the morning started for the village, where we had left some things. The bees were carried by men some 13 miles, and then the start in a physical expert to brought in a 2-wheeled ox-cart 16 miles, thence by coach 12 miles, and

by rail 50 miles.

I made many excursions, but found only one other colony of Apis dorsata. While getting this from a tall tree on a steep declivity, I got soaking wet, and had 4 or 5 miles to walk in the night air. Then I do not think that the water was very good.

There were many sick with fever, and this was one of the very bad districts. Notwithstanding the greatest precautions, I was soon down with the fever—the jungle malarial fever of Kurunegalla. There was no medical aid, and I grew worse; at last, in desperation, I walked several miles through the jungle and went 9 or 10 crowded out.

some medicine, then I went by coach and sail to Colombo, where I was well cared for by the editor of the paper for which I had written some articles. During the last 10 days of my stay in Ceylon I suffered intensely—more than in all my life before. At last, being so weak I could hardly stand, I got on this steamer. I have been gaining strength since then, having had no fever, so now I feel quite like myself, though the heat is fearful.

You can well imagine that, sick

You can well imagine that, sick upon my bed for nearly a week before leaving. I could do little or nothing to prepare the bees for shipment, and just when I had learned to know how to handle the new bees, I was prevented from getting more of them. If felt so well and had such great hope at the end of the first 2 weeks in Cey lon, that I should at last solve the mystery regarding this wonderful bee that, though I had given up all hope of getting enough colonies to pay expenses, still I stayed over another stemmer, determined to make the greatest effort to know about the value of these bees.

I cannot say, exactly, as to what we may expect of them, for 1 do not think I gave them even a fair trial during the few weeks I had these colonies the few weeks I had these colonies. However, they did not fix up their combs readily, nor did they gather much; besides the rascals would not take the sugar syrup much faster than they wanted it to eat, but they amused themselves by fighting each other, and really stinging to death the weaker members of their own family. weaker members of their own family. Their stings are not to be feared, nor are their tongues as long as I expected to find them. They do get honey, and can be kept in well ventilated hives, yet I must consider their introduction into Europe and America as a very doubtful experiment, not because they are not likely to stand pretty cold weather, for they are found in the open air in exposed situations on the tops of high mountains, but 1 hardly believe they will distinguish themselves as honey gatherers. To get them, there should be at least two bee-masters together, and

they should come prepared to spend some months at the work, if a thorough trial of the race and positive results were to be attained.

A letter, written a month ago by Mrs. Benton, was received by me at Aden, and informed me that you wished me to take bees to Cyprus. I Ashall be glad to get them there alive. Mrs. Benton further says, that on ac count of black plague, which is raging in Mesopotamia and parts of Syria, quarantine has been established in Syrian parts. in Syrian ports, and between Beyrout and Cyprus, so that, unless I come via. Alexandria, I may be delayed considerably. I hope to learn that by this time the ports have been opened, as, if I have to go from Suez by rail to Alexandria and then take the English stronger I this between well. lish steamer, I think the expense will be greater, and, if I should not just eatch the English steamer in Alexan-andria there would be several days delay there. Several lines run from Port Said to Beyrout, and there I would get the English or Austrian Lloyd without much delay. Hoping for the best, I am, yours truly, FRANK BENTON.

😭 The Caledonian Apiarian Society will hold its Annual Bee and Honey Show, at Sterling, Scotland, on July 26 to 29, 1881. We have received its Premium List, by the courtesy of its efficient Hon. Secretary, Mr. Robert J. Bennett, of Glasgow. It presents a large and varied list of cash prizes, medals and diplomas, and we hope it will be a very successful show.

all In our next issue we expect to give the table of winter losses, so far as they are heard from. We intended to have given it this week, but it is

### MISCELLANEOUS.

California Honey Crop. —In reference to this, the San Francisco Grocer says

This year, owing to a reported searcity of bee food in some localities, a short crop is anticipated, estimated all the way from twenty to fifty per cent. But as similar fears were entertained a year ago, they may again prove to be unwarranted.

The Crops.-The views of some of the Western Boards of Agriculture concerning the crops for the present season are as follows:

In Ohio the yield is expected to be about 80 per cent. of that of last year, the early sown being the best. The acreage in Michigan is about the same as in 1880, and only 10 or 12 bushels per acre are looked for. Indiana ex-pects a crop of only 30,000,000 bushels, against 47,000,000 last year, the ality being excellent. Wisconsin quality being excellent. has a large acreage in spring, but a half breadth of winter wheat, and the crop is in fine condition. The Iowa board estimates the spring-wheat crop at half that of last year, and the winter sown at 44 per cent.

The Linden or Basswood in Bloom. Mrs. L. Harrison, in the Prairie Farmer remarks as follows:

While I am writing, a bouquet from the linden (Tilia Americana) is by my side. About % of the buds are open, and the fragrance is refreshing. This magnificent shade tree reigns supreme in the profusion and quality of its honey. During the opening of its pale yellow bloom, its branches are eullyened by the humming of bees and buzzing of flies that are reveling upon its sweetness, and the bees are so loth to leave this treasure house of among its leaves, carrying home a load with the first morning light. The largest amount of honey gathered by one colony in one day on rec-ord was from this elegant tree. Therefore, during its bloom every facility should be afforded the little gleaners, that they may make the most of its harvest. Every impediment to their flight should be removed, such as heads of grass or tall weeds, and an easy egress and ingress provided. As fast as surplus boxes are filled and capped, they should be removed, and no colony compelled for want of room to unwilling idleness. Care should be taken to procure honey in the neatest and most attractive way, so that it will please the eye and be in the best marketable shape. Honey must necessarily be a short crop, as so few bees survived the past winter, and reports from California are not flattering, owing to very late frosts killing the bloom. Bee-keepers should be vigilant and ready to take advantage of every flow of nectar, and so remedy, as far as possible, the un-precedented losses of the past winter.

Where our Forests are Going.—The Fishkill, N.Y., Standard remarks as follows on this subject, showing that our natural bee-pasturage is fast passing away, and that the successful beekeeper must plant for his bees:

To make shoe pegs enough for American use consumes annually 100,000 cords of timber, and to make our lucifer matches, 300,000 cubic feet of the best pine are es, 300,000 cubic feet of the best pine are required every year. Lasts and boot trees take 500,000 cords of birch, beech and maple, and the handles of tools 500,000 more. The baking of our bricks consumes 2 000 cords of wood, or what would cover with forest about 50,000 acres of land. Telegraph poles already up represent Telegraph poles already up represent soo,000 trees and their annual repair considerable.

sumes about 300,000 more. The ties of our railroads consume yearly 30 years' growth of 75,000 acres, and to fence all our railroads would cost \$45,000,000, with a yearly expenditure of \$15,000,000 for repairs.

These are some of the ways in which American forests are going. There are others; our packing boxes, for instance, cost in 1874, \$12,000,000, while the timber used each year in making wagons and agricultural implements is valued at more than \$100,000,000.

Will Bees Pay in Oregon !- This mestion is answered by the Oregon Farmer in the following language:

question is answered by the Oregon Farmer in the following language:

If asked, "Will bees pay as well in Oregon as in the Eastern States"? my answer would be, Yes, provided the same care and attention is bestowed upon them here as in the East. By this I mean that they will pay as is the average in the Eastern States, leaving out the certain favored localities.

Our winters are milder, and if the hives are sheltered from the rains, every strong swarm that is well provided with honey and has a strong, healthy queen, will winter safely 99 times out of 100.

In the spring, in this locality—the Willamette valley—the earliest and most important bee forage is our willows, which line the river banks and small streams. From these trees the bees obtain pollen as early as the first week in February. Next in importance are the dandelion. About the first of April the maple opens out a perfect harvest of honey and pollen for the bees, and being supplemented by the peach, plum, pear and apple blossoms, enable the bees to build up strong and prepare for the most important crop of all, the white clover. This begins to open about the first of June and is in reality the main dependence for our surplus boney. The flavor of this honey is unsurpassed, and in favorable seasons the yield continues about 6 weeks, when the honey season, as far as surplus is concerned, may be said to be virtually over. In August and September the bees gather their supplies from golden rod and varions wild blossoms to be found in our forests. In our list of honey-producing plants we must not overlook the locust and the blackberry, both of which are of considerable value in their seasons. In regard to the yield of surplus honey for the season of 1880, among my own bees it was from 2 up to over 80 pounds, the average being about 42 pounds. The same bees also increased by swarming to rather more than domble. Perhaps the best result from any one colony was 50 pounds surplus and four swarms, all of which were large. The worst enemy to bees in Oregon is foul b

Adulteration of Food.—By the San Francisco (Cal.) Examiner we learn that the Chamber of Commerce, of that city, has drafted a bill against the adulteration of food, to be presented to Congress, next winter, and proposes to exert its utmost power to have it pass. Mr Steele, at that meeting, made the following very pertinent remarks:

He said there was a great and urgent necessity for taking some steps to check the horrible and dishonest adulteration of food and drugs now being extensively carried on in America. He thought that the proposed bill was hardly binding enough, and had grave doubts as to whether it would pass, as a great body of adulterators would go to all lengths in lobbying against it. He referred to the honey shipments and said that the pure honey made on this coast could hardly find a buyer in Europe, on account of the glucose adulterations of New York. In this State, he said, that as yet there was no adulteration of sugar, though it was extensively practiced in the East. He thought a good plan would be to make every advertisement and label a contract, any breach of which could be recovered on. He then could be recovered on. He then moved that Congress should be asked by the Chamber of Commerce to pass the proposed bill at once, and that the representatives of California in Congress be urged by the board to use their best efforts to secure its pas-

# SELECTIONS FROM

Dysentery and Lack of Ventilation. Dysentery and Lack of Ventilation.—
I aim very much pleased with the Weekly Bee Journal. I put 17 colonies into my cellar last fall and lost 11; they lived till April; the dysentery was the cause of the trouble. They are doing well now. The dysentery was, I think, caused by their having no ventilation. having no ventilation.

Stillman Valley, Ill., July I, 1881.

Encouraging.—The weather has changed at last! Again the sun shines ont warm and clear, and the fiat has come forth: "Let there be int has come forth: "Let there be honey, and there is honey"—"honey as is honey," too. Yes, the "boom" has struck at last, and the bees are working as they have not worked be-fore this season, or last, either. The long continued wet weather has kept long continued wet weather has kept the white clover blooming continu-ously for the last 5 weeks, and it prom-ises to continue for the next two, so that there is some hope of a good har-vest. Harry G. Burnet. Blairstown, Iowa, July 2, 1881.

Honey Crop. The honey erop is almost a complete failure in Los Angeles and San Diego counties, Cal.; Ventura county also has a very small erop.

11. S. KIMBELL. Cucamonga, Cal., June 25, 1881.

Bees Doing Well.—Our bees are doing well this spring. We only lost 16 out of 85, and wintered on the summer stands. About 23 of the bees in this section died during the winter.

FOSTER & HODGE.

Vorl. ULL July 2 1831

York, Ill., July 3, 1881.

Honey Crop in Texas.—The tirst part of the season here was excessively wet and the latter part excessively wet and the latter part excessively dry—between the two we had about 10 days of fine honey flow. I shall not get more than ½ a crop of honey this year unless it rains in 2 or 3 days, for which there is not the least prospect.

W. H. Andrews.

McKinney, Texas, June 29, 1881.

Honey Plentiful.—Bees are doing well in this part of the country, with a fine prospect for a large yield of sur-plus honey. Accept our best wishes for the welfare of the BEE JOURNAL. SCOVELL & ANDERSON.

Columbus, Kan., June 27, 1881.

[Messrs, Scovell & Anderson are the publishers of the Kansas Bee-Keeper, and with pleasure we give place to their very friendly item. The Weekly BEE JOURNAL presents its 1857, and wishes its Kansas cotemporary success.—ED.]

Well Enough.—I had 8 colonies left out of 22, this spring. I have 22 again; principally increased by natural swarming. Black-bee and boxtural swarming. Black-bee and box-hive men have almost become extinct in this section, although 1 transferred in this section, although 1 transferred one colony this spring that had come through the winter similarly to that mentioned in the Journal; it stood out-of-doors all the winter, without protection; it was strong and was preparing to swarm on the last of April.

John M. Pearson.

Tippecanoe City, O., July 1, 1881.

Unusual Amount of Clover.—The frequent rains of late have caused an unusual growth of white clover with an abundant show of flowers, and bees an abundant show of flowers, and hees are having a good time of it. Minebegan swarming on May 20, and are still keeping it up, but they cannot equal my neighbor's; Thos, Camerer had 2 colonies in the spring, one has east 6 and the other 3 swarms, giving him 11 colonies now. L. James.

Atlanta, Hl., July 2, 1881.

That Ferlilizing Cage.—I have several persons testing my fertilizing cage and await the result before describing it for the BEE JOURNAL. I am making experiments this summer endeavoring to lengthen the tongues of the worker bees by careful and judicious crossing. Fincastle, Ind., July 1, 1881. M. B.

Chips from Sweet Home.—While I was at church (1 seldom go), a swarm entered one of my hives. I'p to June 20 I did not see one live honey bee any bloom on my place, although I watched closely. Three of us have had a swarm enter our depopulated hives.

D. D. PALMER.
New Boston, Ill., June 28, 1881.

Alphabetical.-I see that next year the Bee Journal is to be enlarged. I must say I like it better and better every week; I cannot do without it, and wish it and its editor prosperity.

A.—American Bee Journal.

B.—Best bee paper printed. C.—Cannot be excelled. D.—Don't do without it.

-Excellent type, easy to read. -Fresh every week. -Good for all bee-keepers.

H.—Handy to refer to.

—riandy to refer to.

Y.—You need it every week.
Z.—Zealous friend of bee-keepers.

S. C. Frederick.

Arcadia, Kas., June 25, 1881.

Large Yield of Honey.—I send sample of honey from wild China, a tree that grows in our Texas hottoms. How does it compare with white clover honey? The linden commenced blooming May 15; when it is nearly out of bloom, then the wild China cannot in which gives us about 1 out of bloom, then the wild China comes in, which gives us about 4 weeks of good honey tlow. Then horsemint comes in, giving very good honey. My bees have done very well, so far. In the last 20 days I have taken 4,800 lbs. extracted, and 600 one pound sections; the largest yield from one hive (3 story simplicity), being 240 lbs. I took from it 120 lbs., gathered in 7 days, and all sealed over nicely. In July the milk weed blooms, which gives us a good flow of sharp honey. In October and November we have an abundance of golden rod. I wish the American Bee Journal much success.

J. W. Eckman.
Richmond, Texas, June 20, 1881.

[It is very much like white clover honey in appearance and flavor, but somewhat thinner. It should bring about the same price.—ED.]

Basswood Promising.—The clover honey yield is small. The basswood is opening and is promising for a good honey yield. JAMES HEDDON. honey yield. JAMES HEDD Dowagiae, Mich., July 1, 1881.

The Honey Vield in Canada, -1 am JOURNAL, that I would not be without it if I only had 1 colony of bees.

Bees are doing extra well in this sec-Bees are doing extra well in this section just now, and are gathering lots of honey. Bees wintered well around here last winter, considering how they fared in other places. The loss, so far as 1 can find out, would be about 10 per cent; but bees are mostly kept in box hives in this country, with the exception of a very few, and it is hard to induce people to use the frames. My report for 1881 is as follows: 1 put 84 colonies into winter quarters, and 84 colonies into winter quarters, and

lost 9 colonies in winter, and 11 more by dwindling after putting them out. I had 64 to begin the season with, and they are all doing well. My bees are in the simplicity hives, with the stan-dard Langstroth frame. I expect we will have a large yield of honey here this season. Our main source for honey is from white clover and bass-wood, which is here in any countity. wood, which is here in any quantity.

John W. Calder.

Williamstown, Ont., June 29, 1881.

Poor Yield of Honey .- White elover everywhere, but the continued north winds and frequent rains make me and the bees quite discouraged. I and the bees quite discouraged. I read, with interest, all the reasons given for hast winter's disasters, but to me it is no "marvel of surprise," that bees from sunny Italy cannot live in our climate, in hives 1 inch thick, even with all our chaff. We pay a price for all our higher civilization and cultivation, and we have our choice between the old lor gum or the choice between the old log gum or the bees' natural home, the mixed honey and safe wintering, or nice prize boxes of honey and winter losses.

MARY E. ROGERS. Flint, Mich., June 27, 1881.

The Honey Crop.—I am not going to try to pull through the worst honey season we have had for 20 years without the BEE JOURNAL. The locust bloom was good for 4 days; then it ceased. The white clover is a failure; not more than one blossom in a thousand to what there generally is, and the heavy rains have washed all the the heavy ranks have washed all the honey out of what blossoms there are. The white clover season is over, with us, and the basswood is in full bloom. I think fully half of the bees in movable frame hives in this county died, while those in box hives came through with scarcely a loss; not more than 2 per cent. at most. Bees have thrown per cent. at most. Bees have thrown out more swarms this season than for 3 years past. I use the Langstroth hive, and lost 4 out of 11 last winter. My best colony, last year at this time, produced 85 lbs., and now the best 1 have out of 14 has given but 20 lbs. of surplus. I think the JOURNAL is the bee-keepers' best friend.

Thos. J. Nichols.
New Richmond, O., June 24, 1881.

New Crop of Honey,—By the end of this week I shall have 50 barrels of ex-tracted honey. The barrels hold 47 tracted honey. The barrels hold 47 gallons each, and the honey is of good quality. I have 300 colonies in good condition.

L. Lindsly. Waterloo, La., July 4, 1881.

Top vs. Side Storing .- About all our bees are now working in sections, placed at the sides, while very few are at work on top. It it is objected to let the results of experience pass as argument, would it not be more reasongument, would it not be more reason-able to throw aside theory, no matter how plausible it may appear, when facts and actual experience prove the contrary? We have had an abun-dance of white clover for the last 3 or 4 weeks, but the weather has been dance of winte clover for the last 3 or 4 weeks, but the weather has been very unfavorable to receive any benefit therefrom. Throughout the month of June it has been cool, with north winds prevailing most of the time; the nights especially have been too cold to admit of bees working in sections. The thermometer has stood near the freezing point many nights, and several light frosts have been noticed in some localities. Of course we cannot expect progress mour surplus receptacles unless we have warm nights. The prospect, however, looks a little more encouraging just now, and if the present change should continue for a few weeks, we may yet have a good flow of honey from lasswood. Since writing the foregoing, we have taken a lot of finished sections from our side-storing frames. We have hardly any sections on top, that are even partly capped, so far, and we are more and more convinced that side-storing is an advantage.

GREDNER Bress that side-storing is an advantage

GREINER BROS. Naples, N. Y., July 2, 1881.

Brushing Bees from the Combs.—A novice in handling bees wishes the novice in handling bees wishes the BEE JOURNAL to tell her the best way to get frames of brood or honey clear of bees. We are told to shake them off, but there must be a particular way to shake them that I do know of, for that plan to answer, and if they are broaded off with coving in factors. brushed off with a wing or feathers they get furious, and small blame to them for resenting such rough treatment. So, kind Journal, in the interests of humanity, pray tell us how to proceed.

11. F. B. to proceed.

[There is no better method, that we are aware of, than to use a little smoke judiciously, then with the soft edge of a turkey-wing feather lightly brush the bees off. During hot weather, considerable skill is required to shake off the bees, as the combs are very tender, and break out easily.—Eb.]

Calling Things by Wrong Names.—
MR. EDITOR: On page 204 of the Bre JOURNAL, you say: "Calling things by wrong names leads to endless trouble and vexation," and yet, you say on page 206, "Yes; there are fertile workers." Why this adulteration? Why not say "laying workers?" If they were fertile, would not their eggs produce other workers, like those of a fertile queen? fertile queen?

[We think had "Critic" consulted Webster's Unabridged, he would not have been so hasty. Fertile or laying workers produce eggs, but do not reproduce workers; all queen bees are supposed to be fertile, even though not mated with a drone, but they do not reproduce queens or workers unless properly mated with a drone. If the orthographical definition and universal custom can sanction the use of a special phrase, then "fertile" worker is a proper expression, and Critic will have to exercise his "fertile" brain on some other technicality.—Ep.]

A Month Behind.—My bees came through to the 1st of April well, but dwindled then and had to be fed much. They are one month behind in quantities. tity of bees and honey, compared with 1880. J. A. Burrow, M. D. Santa Fe, Tenn.

It has Almost Rained Honey,—After losing all my bees (150 colonies) I bought 6 colonies of black bees. I now have 28 colonies in fair condition with 24 laying queens. I expect with 24 laying queens. 1 expect to have 50 colonies in the fall, and 1 think I shall succeed. I have plenty of honey and combs on hand from the hives where my bees died. It has almost rained honey in this locality this ear. A. C. Balen. Kalamazoo, Mich., July 7, 1881.

Loss 25 per cent.—I lost 25 per cent. Loss 25 per cent.—1 lost 25 per cent. of bees last winter from starvation. I use the 10-traine Langstroth hive; wintered in a cellar under a barn, built on a side hill, the lower side facing the east; thermometer 30 to 35°; absorbents on top of frames, 3 inches of buckwheat chaff; caps on, front entrance open; dysentery showed itself in spring, but not to any amount.

C. McDermott.

Malone, N. Y., June 6, 1881.

Doubled.-- l have already doubled any number of colonies (1 lost none last winter). They are storing honey very fast from white clover.

John Heron.
Lockridge, Iowa, June 14, 1881.

The Northwestern Bee-Keepers' Association will meet in Chicago, on Tuesday and Wednesday, October 25 and 26. \*Il bee keepers are cordially invited to attend. It is desired to make this one of the most interesting conventions even held in the United States. C. C. MILLER, M. D., Pres. C. C. COMENDRIEN, S.C. States. C. C. Miller, M. C. C. Coffinberry, Sec.

### SPECIAL NOTICES.

Those who may wish to change from other editions to the Weckly, can do so by paying the difference. ....

When changing a postoffice address, mention the old as well as the new address.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 ets. each, or \$8 per 100.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Photographs of prominent Apiarists—Langstroth, Dzierzon, and the baron of Berlepsch.—Price 25 cents each.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Because it adds to Personal Beauty by restoring color and lustre to gray or faded hair, and is beneficial to the scalp, is why Parker's Hair Balsam is such a popular dressing.

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper: it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, want taken by the leaving in the idea. are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them.

Premiums.—For a club of 2, weekly we give a copy of "Bees and Honey;" for a club of 5, weekly, we will give a Cook's Manual, a Bee-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the Journal for a year free. It will pay to devote a few hours to the BEE JOURNAL.

It is a Foolish Mistake to confound a remedy of merit with the quack medicines now so common. We have used Parker's Ginger Tonic with the happiest results for Rheumatism and Dyspepsia, and when worn out by overwork, and know it to be a sterling health restorative.—*Times*. See adv. 27w4

It would save us much trouble if all would save us much frouble, if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State,—Also, if you live near one postoffice and get your main at another, be sure to give the address we have on our list. give the address we have on our list.

### CLUBBING LIST.

We supply the Weekly American Rec Journal and any of the following periodicals, for 1881, at the prices quoted in the last column of figures. The first column gives the regular price of both :

we have made the grandest oner of the century.

FOR 25 CENTS, A COPY OF ANY BOOK IN THIS LIST WILL BE SENT BY MAIL, POST-PAID.

Orders taken now, and books mailed as soon as published. One will be issued every two weeks.

Orders taken now, and books mailed as soon as pablished. One will be issued every two weeks.

LIFE and ADVENTURES of ROBINSON CRUSOE. This well-known book may be ranked as the most popular standard juvenile book ever printed. Our edition is complete, and contains the wonderful adventures of a cast-away upon a desert island. Complete in one vol. Fully illustrated.

THE PILGRIMS PROGRESS

From this world to that which is to come. This remarkable book, as every one knows, was written under the similitade of a dream, by John Bunyan, the most popular religious writer in the English language; and jurchaps more conies have been sold than any other book except the Bible. Our edition is complete and unabridged, with appropriate illustrations.

GULLIVER S TRAVELS.

This book tells of the supposed travels and surprising adventures of Lemnel Gulliver into several remote regions of the world, where he met with a race of people no larger than your hand. Also his wenderful explaits among giants. Complete in me volume. Finely illustrated.

THE ARFBIAN NIGHTS' ENTERTAINMENTS. Illustrated with numerous wood engravings, descriptive of those many strange and singular stories which the legical says the Sultaness of Peeric where the supposed travels and singular stories which the legical says the Sultaness of Peeric where the Sultaness of Peeric where the Sultaness of the Sultaness

in one volume. Finely illustrated.

THE ARABIAN NIGHTS' ENTERTA'NMENTS.

Illustrated with numerous wood engravings, descriptive of those many strange and singular stories which the legend says the Sultaness of Parsic related to the Sultan night after night, in order to prolong her life, and thus finally won his affections and delivered the many virgins, who but for her would have been sacrificed to his unjust resentment.

SAVED AT LAST FROM AMONG THE MORMONS. Livery man and woman in the land should read this story which is founded upon facts, and gives an insight into the low estate of woman under the Mormon rule.

BREAD AND CHEESE AND KISSES.

READ AND CHEESE AND KISSES.

By R. L. Farjeon, A very popular Christmas story after the style of Dickens; abounds in excellent and novel features; is chiefly remarkable for its admirable picture of country life, giving the listory of a very happy and contented young couple who thought no fot in life too lowly for the pure enjoyment of Bread and Cheese and Kisses. Complete in one volume, with illustrations.

The usual price of these books bound in cloth is\$1.00 to \$3.00 each. We propose to bind them in heavy paper or thin eard board, and send them by mail and prepay the postage, for 25 cents each. They comprise a wine range and striking diversity of the most brilliant and pleasing productions of the most noted and popular authors, and include books of travels, adventures, fiction and humor, so that all fastes will be suited. We propose to call if the FARM AND FIRESIDE HERMEY, and any one obtaining these ten books will possess a bindary of ten of the most popular books ever published. We have not from to give a full description of each book, but all will be delighted who obtain the se noted books at so low a price.

ÆSOP'S FABLES.

THE BOOKS will be the latest and most complete editions, and will contain many illustrations, one alone requiring thirty-nine pictures to complete it.

THE PAGES are about 5½ by 8 inches—the most convenient size for reading and preservation.

THE TYPE is Minion, easy on the eyes. THE PAPER is heavy and of a beautiful white color

THE FIRST ROOK. Robinson Crusee, was ready about April 1st. One of the others will follow every two weeks and he mailed to subscribers as soon as published.

EXILIABLE.—Messis. Rowell & Co., publishers of the American Newspaper Directory, writing of the publishers of Farm and Fireside, say, "they are accredited by the Mercantile Agencies with a capital of a Milhon dollars, and are too well known and too much respected to make it worth while to make any statements which are not true." Therefore all are sure to get the above books if careful tod tree letters coirculty.

MONEY SHOULD BESENT by Post Office Money Order or Registered Letter, addressed to Publishers of FARM AND FIRESIDE, Springfield, Ohio.

ESOP'S FABLES.

The rames of Asopus, an apt representative of the great so tal and intellectual movement of the are which he adorned. Born a slave, ne forced his way by his mother-wit into the courts of princes. He knew that to be tolerated in courts he must speak to please, and he gave lessons both to prince and people by recitals of fables, which were very popular in Athens during the most brilliant period of its literary history; and he who had not Asop's Fahles at his finger's ends was looked upon as an illiterate dunce by Athenian gentlemen. In one vol. Very profusely illustrated.

A history and description of noble deeds, presenting correct and beautiful models of noble life to awaken the impulse to imitate what we admire. By the recorded actions of the great and good we regulate our own course, and steer, star-guided, over life's trackless ocean.

Read what they Say! The only swarm of bees alive in this township, contains a queen 1 bought of you; they are lively.

Greencastle, Ind., April 16, 1881.

Of the 31 dollar eneens purchased of you last season, only one proved impurely ferti ized. They have wintered inely, while three-fourths of the bees in this section are dead. Livonia Station, N. Y., April 11, 1881.

# \$250.00 in U. S. Bonds, The Bee-Keeper's Guide; THE ORIGINAL

MANUAL OF THE APIARY.

By A. J. COOK,

Of Lansing, Professor of Entomology in the State Agricultural College of Michigan.

320 Pages; 133 Fine Illustrations.

- -:0:---This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 5,000 copies was exhausted in about 18 months—a safe unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, Illustrated with many costly wood engravings -the products of the Honey Bee; the races of bees full descriptions of honey-producing plants, frees shrubs, etc., splendidly illustrated and last, though not least, detailed instructions for the various manipulations necessary in the apary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the aplarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value. —L'Apteullure, Paris.

I think Cook's Manual is the best of our American works.—Lewis T. COLBY.

It appears to have cut the ground from under future book-makers. British Bec Journal.

Inture book makers. — Bratish Rec Journal.

Is a masterly production, and one that no beekeeper, however limited his means, can afford to
do without — Nebraska Farmer.

Prof. Cook's valuable Manual has been my constant guide in any operations and successful management of the apiary.—J. P. WEST.

agement of the apary.—3. P. West.

I have derived more practical knowledge from
Prof. Cook's New Manual of the Apiary than from
any other book.—E. H. WYNKOUP.

any other book.—E. H. WYNKODP.
This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret having purchased.—Mich. Für.
To all who wish to engage in bee culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Herald, Monticello, 11.

My success has been so great as to almost astonish myself, and much of it is due to the clear, distincted information contained in Cook's Manual.—WM. VAN ANTWERP, M. D.

interested information contained in Gook's Manual—WM. VAN ANTWERFER, M. D.

This book is pronounced by the press and leading bee-men to be the most complete and practical treatise on bee-culture in Europe or America; a scientific work on modern bee management that every experienced bee-man will welcome, and it is essential to every amateur in here-culture. It is handsomely printed, neatly bound, and is a credit to the West.—Western Agriculturist.

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiars. There is no subject relating to the culture of bees left untouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowlede of apiarists, which he ness admirably to promote and make popular this most interesting of allocoupstions.—American Inventor. It is the latest book on the bee, and trust of both the bee and hives, with their implements. It is of value to all bee-raisers.—Ky\_Live Stock Record.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—A. E. WENZEL.

It is a credit to the author as well the publisher. I have never yet net, with a work, either French or foreign, which I like so much.—I/Amer De Bons, editor of the Bulletin D' Aproutteur, France.

Bors, editor of the Bulletin D' Aprendieur, France, It not only gives the matural history of these industrions insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees.—Democrat, Pulasks, N. Y. We have perused with great pleasure this rade merium of the bee-keeper. It is replete with the hest information on everything belonging to apiculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice as advised.—Agriculturist, Quebee.

### How to Produce the "Coming Bee."

C. J. ROBINSON.

Among progressive bee-keepers there seems to be various speculative ideas concerning the "coming bee," or the manufacture of a breed of bees superior to those obtainable at the present time. Now that the production of honey is looming up as one of the most lucrative branches of industhe most lucrative branches of industry adapted to many regions of the world, it behooves the producers of that commodity to look about for the best servants to gather in and store the crops of nectar. The soaring bee-keepers are not satisfied with the "scrubs" (bees) of either Continent, or Islands yet explored, and none others exist unless it be the Americanized Italian bee.

The American bee-breeder now has

canized Italian bee.

The American bee-breeder now has at hand types of all the different species or distinct races of bees from all climes, and in the near future the history of the American merino sheep is to be repeated in the improved Americanized honey bee. The fine-wooled sheep of Spain had been famous for centuries. The "Transhumantes," or traveling flocks, were known as merino sheep. Prior to the introduction of merinos into this country (their expectation was prohibited in 1809). portation was prohibited up to 1802) there were several distinct families, such as Spanish merinos, French merinos, Saxon merinos, and Silesian merinos. In 1802 Chancellor Livingston, American Minister at France, sent to his farm in New York 2 pairs of merinos from the French national flock at Chalons. Col. David Humphreys, of Conn., American Minister at Spain, in 1802 brought home with him a flock of Spanish sheep. In 1810

3,850 to the United States, to be distributed: 1,500 in New York; 1,000 in Boston and Newburyport; the remainder to Philadelphia, Baltimore, Alexandria, Norfolk and Richmond, reserving 350 for himself. Just at reserving 350 for himself. Just at that time those Spanish sheep were obtainable in consequence of the French invasion of Spain, and the confiscation of the flocks of the grandees, who had bred these sheep conformable to the natural laws for imprevement, as they funcied, during a long period. Each grandee, such as the Prince of Peace, kept a flock of a strain differing somewhat from either of the others. For instance, the said Prince owned the Taulars; the Coude Campo de Alange, proprietor of the Campo de Alange, proprietor of the Negrettis; then there were the Escu-rials, Infantados, and Montarcos, be-sides the Aqueirres. From these sevsides the Aqueirres. From these several families sprung the improved American merino. And what of the improvement? The best sheep of Spain or the highest bred sheep of Spain or the highest bred sheep of Europe only yielded 10 pounds of wool per fleece, as the highest—about one pound of wool to 12 pounds of carcass, while "Gold Drop," the famous \$10,000 buck, a good type of the American merino, gave a yield of 40 lbs. of wool annually—4 lbs. of wool to 11 of carcass. This great improvement is a triumph of the American to II of carcass. This great improve-ment is a triumph of the American breeder, through a continued "sur-vival of the littest," by the "relentless hand," through the agency of man. The census return shows a progres-sive improvement in weight per fleeve during each decade for more than half a century.

Mr. Jarvis, Consul at Lisbon, shipped

The history of the improved American merino is parallel with the his-tory of the Americanized breeds of the representatives of domestic husbandry. That which has been done by skillful breeders of domestic animals in this country in the line of improvement may be wrought by the American apiarists. England is no longer the nursery of improved stock, nor has Italy, the Oriental Isles, jungles of Ceylon, Holy Land, or other country ever been the nursery of sci-entific bee-culture. The whole field for improvement in bee-breeding is

for improvement in bee-breeding is yet unoccupied, except, perhaps, a few Americans who have attempted to enter the broad domain of improved breeding.

Upon few subjects connected with domestic economy, probably upon no single one, is there greater need of diffusion of knowledge than in regard to the principles of breeding. Even to the principles of breeding. Even with professed scientists, who write upon the subject occasionally, the alpha and omega of their philosophy is embraced in the axiom that a "survival of the littest" by "the relentless hand" of chance is the road to improvement of race or breed. Now, if this axiom be

and internal in form and in construc-

tion.

By virtue of some of these changes that basbeen attained. great improvement has been attained. Our most valuable animals are, i some sense, a manufactured articlein some sense, a manifactured article— a creation through the agency of man. The object of the bee-keeper, like that of men engaged in other avoca-tions, is profit, and, like other men, the bee-keeper may expect success in proportion to the skill, care, judgment and perseverance with which his operations are conducted. The improvement of domestic ani-mals and insects so as greatly to en-hance their individual and aggregate hance their individual and aggregate value to render the rearing of them more profitable to all concerned, is one of the achievements of advanced civilization and enlightenment, and is as much a science of triumph and skill as the construction of a railroad, a steamship, an electric telegraph, or any work of arhitecture. The truth is, and it is of no use to deny or disguise the fact, the improvement of domestic animals (including insects) is one of the most important, and, until of late and even now, one of the most neglected branches of domestic economy. Let the ill-favored, chancebreed mongrel, so common, testify. To assert that Dame Chance is the scienced breeder is advocating doctrines countering the teachings of science—scientific bee-culture, and belittles the intelligence and attributes skill as the construction of a railroad. littles the intelligence and attributes of mankind. If it is true that the Apis mellifica of any clime has been of mankind. If it is true that the Apis mellifica of any clime has been perfected by a beautiful "letting alone" and "the severe pruning of the relentless hand of nature," why is it that there should be any difference between the bees of Italy, Cyprus, Syria, and America? Each have been left to the "pruning which nature practices with relentless hand during centuries. No attempt has been made to interfere with said hand other than to hide domiciled bees in a box of straw or chaff, which beats entirely the hand of nature in relentless pruning. And if it is the littest that survive such relentless pruning, those that survived the stern ordeal of last winter's pruning must be doubly fittest for perpetuating the race, and the fancied reasons for importing bees that have been "bred under the most trying circumstances," in order to keep "our apiaries from deteriorating," is absurd.

In the case of creating the improved American merino, the breeders did resort to importing the survivers of

In the case of creating the improved American merino, the breeders did resort to importing the survivers of nature's scrubs, with which to comple in the breeding to give intensity of vigor or preponderance of any desired superiority. And if, as in the improved sheep, bees can be bred that will produce 4 times the amount of honey gathered by the fittest native and European races, it is worth while to give attention to the subject. The

carry us beyond any record of history or tradition regarding it, but, few doubt that all the varieties sprang each originally from a single type, and that the many variations are due to causes connected with their domestication, and influence of climate and

other circumstances.

Now that the renowned tourist, Mr Benton, has obtained the famous elephantine honey bee (I ignore or drop the Latin), which is said to be a dis-tinct species, why not breed mule and himy hybrid honey bees? Comrades Jones and Benton have acquired a valid title to fame as enterprising philanthropists. Thanks to their contributions to scientific bee-culture, which opens a wide field for the improvement of races and originating new breeds.

The space allotted me will not allow of my writing of the principles involved in the philosophy of breeding, but in a future article I may attempt to do so briefly.

Richford, N. Y.

For the American Bee Journal. Getting Rid of Fertile Workers.

J. M. VALENTINE.

Yesterday, from 8 a.m. to 4 p. m., I took off, all alone, 110 section boxes, trimmed them up and put them away, then took out and extracted 26 gallons of honey, and cleaned up and put the things in the honey house in order, the thermometer ranging from 87° to 97° in the shade. I do not know whether it was a big day's work, as I have not heard others say what they have not heard others say what they can do; at any rate, I know I was tired enough. Bees are doing well. We have had a good run on white clover, and the bees are now gathering from both clover and basswood. I have taken from 40 to 60 1½-1b, sections from a number of hives. I did not double up as I should have done in the spring. There are colonies that just now are in good working condition, which, had they been doubled together would have given me 60 lbs. of honey, after which they could have been divided and be as good as they are now. It will not pay to keep a weak colony. I found a colony a few days ago that had a fertile worker. They cast a swarm June 1st, and a few days after a second swarm. As I did not want to use the young queens that were with them, I pinched them all (6 in number) and the bees returned to the old hive. A few days ago I examined them and found they had a fertile worker. I took two-empty hives, set one on either side of the old one, and lifted ont a frame and put in one, and the next frame in the other, alternating them till all were trunsferred. After shaktill all were transferred. After shaking out all the bees I moved the old hive away, and gave each colony a ripe cell. Now each have a fine young queen. Let some one who has a fer-tile worker try the same process, and

report.

I like the Weekly BEE JOURNAL first rate. There is just enough in each paper for one dose—I can digest it all nicely.

Carlinville, Ill., July 2, 1881.

For the American Bee Journal,

### An Excellent Canadian Apiary.

WM. F. CLARKE.

There are many excellent bee-keepers, quite unknown to fame, who are pursuing the even tenor of their way, and quietly enjoying their favorite pursuit, without much opportunity of association with those of kindred association with those of kindred tastes. I unearthed one of this class on Dominion Day, July 1. A cheap excursion trip tempted me to go to Kincardine, the Lake Huron terminus Kincardine, the Lake Huron terminus of our railroad, 57 miles from here. I wanted to see the place and the lake, but was chiefly anxions to ferret out a man who had the repute of being "daft" on bees. Whenever you hear this kind of argument about a man, you may suspect that you are on the track of a scientific apiarist. The multitude regard it as a sign of lunacy for a man to be a close and earnest student of bee-life. Common-sense people, you know, keep bees on the free-and-easy, "go-as-yon-please" plan; soon discover that bee-keeping is a humbug; quit it in disgust, and rail against it on every available op-

portunity.

Mr. George Sturgeon makes tinsmithing his business and bee-keeping his pleasure. I was agreeably surprised to find in his out-of-the-way little town one of the neatest, best approximated animies I have ever visited. pointed apiaries I have ever visited. It was a holiday, and the proprietor was finding his fun among his bees, which were having a jolly time of it, swarming. Mr. S. is one of those beekeepers who, after full trial of artificial swarming prefers the natural way of it. He thinks he gets better queens, more vigorous colonies, and more satisfactory results generally, on Dame Nature's plan. The state of his apiary goes far to justify his practice. A more sufference with the processing of the state of his apiary goes far to justify his practice. tice. A more uniform, nicely marked, even-tempered lot of Italian bees f Inever saw than these. Mr. S. proared a dozen queens from Tennessee, I forget how long since, and also imported a few direct from Italy. He has practiced judicious selection, and the "survival of the fittest" with such results that if any bee-keeper can go through his apiary, and not break the Tenth Commandment—he is a better Christian than I am. I coaxed my newly-found friend to sell me one of his colonies, and it is now humming away in my garden very musically.

Like my apicultural brethren m general, I am studying up the ques-tion of wintering. Now here comes Mr. Sturgeon's experience to compli-cate things. He wintered ½ his bees in A. I. Root's chaff-packed hive, and the rest in a brick bee-house. All his out-door colonies did well; one, how-ever, proved queenless. Out of 20 Like my apicultural brethren in out-door colonies did well; one, however, proved queenless. Out of 20 wintered in the brick bee-house, he lost 15, and the remaining 5 were rather weak. Of course Mr. S. is enthusiastically in favor of chaff-packed hives. We all praise the bridge that carries us over safely. I should like to know from parties who have tried chaff-packed hives with such diverseresults, how these hives were treated in other respects? Had they any shelter, or did they stand out in the open air? Mr. S.'s hives were in a well protected place, close under the lee of a tight board fence, and I am inclined to think that even a chaff-packed hive is none the worse for such a triendly shelter. a friendly shelter.
We opened some 20 hives to inspect

the queens. In several cases we had no need for a puff of smoke, so quiet were the bees. There are no other bees near there, and I think when there is no intrusion of strangers and the consequent quarrelling, pacific habits are formed, a sort of family feeling gets established, and gentle-ness becomes a characteristic. Why should we not breed for a peaceable and quiet spirit among our bees, if it can

either quit the tin-smithing or quit press down well to the iron another bee-keeping. His heart is evidently with his bees, but the care of them encroaches too much on business. is happier in his apiary than he is in his tin-shop, and my private opinion is that the bees will gain his undivided attention, and that he will make

### Common-Sense Apiary.

DR. W. G. PHELPS.

It has been well said that the best evidence of a successful life is for one to succeed. Success, in any channel of life, is only another word for patience and persistency. Success in bec-keeping comprehends the exercise of both these valuable traits of character, and still more, it means the exercise of economy. Observe well these 3 and success will, ordinarily, crown any intelligent apiarist's efforts, close and sharp as may be the competitors in bec-keeping. To receive the greatest aid in practicing these, the aver-It has been well said that the best and sharp as may be the competitors in bee-keeping. To receive the greatest aid in practicing these, the average bee-keeper "hankers" after facts, when he searches his bee literature and preserves his JOUNNAL. The "old heads" in apiculture may talk learnedly, and the untrained fire off their enthusiasm, but plain hard facts are what we want. While others are hammering away on the wintering problem, or the bee dysentery puzzle (neither of which have ever troubled me, save once, when seduced into using that first-class bee poison, grape sugar), I will try and give your readers directions for getting up a cheap and serviceable foundation machine. In using the columns of your widely-In using the columns of your widely-circulated JOURNAL I shall doubtless aid many who are groping in the dark, and save myself the trouble of answering personally the many inquiries that have been directed to me.

Mine is, in some respects, "the old, old story" of utilizing plaster casts to produce foundation. This subject I introduced to the public through the columns of Gleanings in 1877, and have ventilated the matter at intervals subsequently. The development of this ventilated the matter at mervais sursequently. The development of this matter has been a real case of patient, persistent study, forced upon me by economic motives, and I can truly say I have "got it" at last. Gleanings for August, 1880, contains an article of mine, giving a general review of what had head head on the time. The anne, giving a general review of what had been done up to that time. The credit due me is of little moment in comparison to the importance of get-ting a press that will answer every purpose and yet be inexpensive.

My press is made as follows: Two or wrought iron pans, 1, deep, are hinged together; to the up-permost one a handle 2 feet or more permost one a namure 2 rect or more in length is attached; flaps with screw holes are made on the lower pain. Within these pans are accurately ar-ranged and secured the plaster casts,

previously run.
Guides of iron are put on each side to conduct the two halves into juxtaposition when brought together. Juxtaposition when brought together. Screw down the lower half to a strong bench, place a sheet of wax, previously softened in warm water, between and exert a moderate pressure, and your foundation is made in quicker time than it takes to tell it. The sheets of wax I place close by the press in a pan of water, kept at uniform temperature. Of course, a discounter than the pression of the pression form temperature. Of course a dipping apparatus is necessary to previously prepare the plain sheets, as with any other mill or press.

It seems hardly necessary to give directions for making the plaster casts, so often described before, yet I will do so brielly. I place the sheet of foundation, from which I get the casts, on a piece of glass, and rub into each cell, with an old tooth brush, a strang solution of som. Around and strong solution of soap. Around, and closely fitting the piece of foundation, the had without the sacrifice of other important qualities?

Mr. Sturgeon is a disciple of A. I. Root's, uses the simplicity hive, and runs his apiary by the "A B C" book, Ile has made up his mind that he must strong solution of soap. Around, and delions; I had to extract some to give the queens room. Clover is beginning to bloom and promises well. The latter was also true of basswood until the army-worm put in an appearance, and now, in my immediate only the best Italians to be had, and

piece of glass, slightly larger than the rim, to give a smooth back to your casts. These casts, when taken from casts. These easts, when taken from the rims, should just lit the pun in press, and when properly hardened with baryta water and soluble glass, will stand a great deal of use.

I will add, for the benefit of economical bee-keepers, that this press need not cost over \$6. In my own I

ise a set screw on the hinge, to regu tate the thickness of the foundation I wish to make. Hoping these points may be of benefit to some of your readers, I will close with a "long live the Berg LOUDIAL". the Bee Journal.

Galena, Md., July 8, 1881.

# The Hive that I Like Best.

L. A. PENNOYER.

Bees are doing well now, but swarm too much. The first day of June 1 took off 7 two-lb, boxes from one hive. the earliest I ever obtained. I put 10 colonies in the cellar November 15th, and April 15th to 1 and April 15th took out 9 in fair conand April 15th took out 9 in fair condition. I left is on the summer stands in double-walled hives, packed with chaff 4 inches thick, front and rear, and 5 inches at each end. I use the Doolittle hive, except that I build them. 18 inches high instead of 12 inches: this gives me 6 inches of chaff above this gives me 6 inches or chair above the brood frames, and 6 inches airspace in the cap, with airsholes bored in the side of the cap to give a free circulation above the chaff. I banked sawdust on the ends and rear of the hives as high as the brood chamber, and stood the shade-board in front. and stood the shade-board in front. Result: every hive except one had combs as bright as in summer; the exception had a little mold in one end. When I opened them, on the 5th day of March, I found from 3 to 5 combs of brood. I have the Gallup frame; there was capped brood within one inch of the bottom of the frame, and against within half an inch of the bottom. eggs within half an inch of the bottom-bar. The colony which had 5 combs of brood is the one from which 1 obtained the honey June 1st. Early Those I had in the cellar dwindled badly; I think I should have lost some had in the those some had in the think I should have lost some had I not kept them up with broad from those wintered out-of-doors. A great deal of the loss here was after April I April 1. Winona, Minn., June 14, ISS1.

For the American Bee Journal.

### The Army-Worm and Basswood.

B. T. DAVENPORT.

About a week ago my bees were "weighed in the balance and found wanting." I have but 31 colonies out of the 87 put in the cellar Nov. 20. They were put out and had a good flight on March 18, at which time they were weighting with discontant. were suffering with dysentery, but only 5 had succumbed to "that sleep which knows no waking," and 2 of these had starved. They were put back in the cellar on the morning of the 19th, and remained there until April 15, when 1 found 15 dead, and more than that many weak. I use the S-frame Langstroth hive, and for winter put cushions of burlap over the frames, after removing all houey-boards. I think my bees were disturbed too much during the fore part turbed too much during the fore part of winter; they should not see a gleam of light, if possible. Our cellar is damp, but well ventilated, and the temperature ranged from 36 to 41°. I believe that 23°, if not 34° of the bees in Waushara county are dead, and, as far as I have learned, they are "deader" still in the county east of this, but what are left have just been booming since fruit bloom. I never saw bees get so much honey from dandelions; I had to extract some to give the queens room. Clover is beginning to bloom and promises well.

vicinity at least, nothing but the naked limbs remain, both leaves and blossom-buds being stripped. A Weekly BEE JOURNAL is just what we need and must have. Long may it who?

Auroraville, Wis., June 2, 1881.

For the American Bee Journal.

### A Practical Bee-House.

C. F. GREENING.

In answer to the request for a description of a bee-house that successfully wintered bees last winier, I will describe mine for the benefit of D. S. Kalley, and others. I have studied the requirements of the bees, then tried to meet them. I excavated a pit 12x16x3 feet deep, at the west end of my apiary, and not over 150 feet from the farthest hive. Pit-wall, of brick, to level with ground, wain-scotted inside, with 2-inch air-space. Frame 6 feet high on top of wall, of 2x6 studding, using shiplap lumber for In answer to the request for a de-Frame 6 feet high on top of wall, of 236 studding, using shiplap lumber for insides and celling, with 8-inch drop-siding for outside. I filled in the walls solid with dry sawdust. For rafters 1 took 2x12x12 feet, beveled down to 4 inches at ends, leaving full in the center, filled over ceiling with 4 inches of dry sawdust, making solid from 6 to 4 inches of sawdust from sill to sill, and over-head. Roof-boards lengthwise, 16 feet, then finished with match flooring, coal-tarred together, and 3s-inch battens to break together, and 3<sub>8</sub>-inch battens to break joints, on top of all, with a good coat of boiling coal-tar over all, making top of house same as freight ear roof. I top of house same as treight car roof. I put one 7-inch ventilator through roof and ceiling, 4 feet from each end, letting one extend to within a foot of the bottom of the pit, the other just through the ceiling. The cold air strikes the bottom of the pit and circulates all over the room, while the hot, damp, impure air escapes through the sibrt one. One window in south the short one. One window in south side of bee-house, with storm sash outside, and another inside, lined around edges with heavy wool cloth. around edges with heavy wool cloth. My window is then always clear of frost. One door in east end opens outside, and another door inside, both battened with cloth, with hooks to draw tight. My thoor is "mother earth," with 2 inches dry sawdust. My bee-house is always fresh and dry, with no draft, but photter of view.

with no draft, but plenty of air.

If very cold, say 20 to 30 below zero, I close both ventilators with cloth, until the temperature rises in the bee-house, then open short ventilator, and the other as required. The coldest weather last winter, mercury 32 below zero, with a howling blizzard 32 below zero, with a howling blizzard in progress, my pets were closed up, air-tight, comparatively, but no sound was heard inside except their low, quiet, cheerful hum, as natural as a summer night. I keep the window heavily curtained so that it is absolute darkness within. I use a tiny beeswax candle when visiting them, and watch the thermometer closely, and keep it as near the freezing point as possible. A few nights it went some possible. A few nights it went some degrees below, but by closing the ven-tilators a few hours it went up to 35° again.

I place my hives, one row, the strong-st, around the outside next to the wall, but not touching it, and 3 rows of shelves around, and stack them up, making 1 tiers, but none touching one another or the wall. Thus I get ab-solute quiet and darkness (most essential requisites).
In the winter of 1879-80 I had 27 col-

onies in bee houses, wintered with a omes in bee houses, wintered with a loss of only one colony, which starved, through my neglect. In the winter of 1880-81 I had 50 colonies and lost 21 which died with plenty of stores, but no dysentery. Why it was thus I do not know, unless they tired of life. They clustered over 5 frames and died. My 48 colonies came out A 1, after a "total eclipse" of 135 days. Two spring dwindled some and 10 I doubled up, believing that in "union

am ready to compare stock with any in America. Bees are just booming now, rolling in white clover. On July 1st 1 had 9 swarms and saved all. 1 prepare for winter by setting my hives on a 2-inch square frame, to catch rubbish, take off the covers and cover with heavy duck, with 4 to 6 inches square of wire cloth cov ering a hole in center of duck cloth.

### Bees and their Pasturage in Utah.

J. E. JOHNSON.

The bee in Utah is quite a power. The bee in C tan is quite a power, especially as we make sugar from neither maple trees, beets or sugar cane, and have only Chinese sorghum and bees to help us to sweetening; all else is imported. Our climate is wonderfully free from moisture and rainfells in the convergence of the contraction. falls are rare, especially in sonthern Utah; these causes make a scarcity of bee forage growing wild within reach of bee industry. In the northern portion of the Territory winter generally brings enough snow to make the wild flowers bloom more profusely than at this place (St. George). In this country the inhabitants live in yillages in the foot-hills, and generally have to go to the river bottoms some miles away to make farms. The towns are provided with water for the gardens, and here the bees are kept. The gardens and orchards turnish forage in a great measure, which to-gether with the wild flowers that bloom early, and the great American bee plant, that grows on sandy wastes and blossoms from January till September, serve to keep these little honey gatherers busy.

Where the fields and lucerne

Where the fields and lucerne meadows are within 3 or 4 miles from meadows are within 3 or 4 inles from town, there are periods when at the blooming stage of the crops, great help is afforded in honey-making. In some sections the bee plant grows in tracts of many acres, and often borders highways in such a manuer as to make one foreign plantial. make bee forage plentiful and rich; in other regions the seed is sown to get it started, after which the plant reproduces itself without further trou-ble. Where this grows abundantly there is no need of growing plants on purpose for bee pasturage; where it purpose for bee pasturage purpose for bee pasturage; where it is scarce we plant patches of mignon-ette, sweet clover, and squash and melon vines, and such garden flowers are most productive of honey and

pollen.

In my long experience of bee-keeping I have found 3 plants superior to all others for the production of honey, viz: the purple-flowered bee plant, next mignonette, and third melilot or sweet clover. The 2 last named will make honey so perfumed as to be far superior to that made of any other plants, and such honey brings fancy prices in markets where it is known and tested. Lucerne makes a nice amber honey and is worked on indusamber honey and is worked on industriously by the bees, but it does not produce like the plants named above. The mesquite, a shrubby, sprawling tree of the Pulse family, produces a burden of bloom, often twice a year, similar to that of the filbert and chestnut, from which an immense crop honey is gathered, and some pollen, also.

The lycium and several other honey plants are abundant here. Our average yield of honey would perhaps be about 50 lbs. each season to the colony. Our varieties of bees are Italians and hybrids. In northern Utah the bee industry has been greatly retarded by thousands of cases of foul brood—no case has as yet occurred in southern Utah.

Our Legislature has passed a law providing for the destruction of colo-

To beginners in the business 1 of-Do not be in too fer this advice: Do not be in too great haste to increase your colonies or to eat honey—you will get on much faster by going slowly; that is, never weaken your colonies by dividing, or by robbing them of honey; when not rich with honey and full of bees, then 2 frames taken out of a full hive at a time will give room to work. I started here with one colony, for which I paid \$15. In 6 years I had 200 colonies, and had lost, by improperly weaken ing the colonies for increase, an equal number.—Had I been more patient I doubt not I might have had 500 strong colonies, and lost none.

In case a colony becomes queenless, it is quite probable there are but few, if any young bees in the hive—now, the young bees are the wax workers, and unless there are some in the hive you cannot get a queen-cell made; the old bees will not do it. When, the old bees will not do it. When, therefore, a frame of eggs is put into a hive that a queen may be made, be sure to put in also a good quantity of young bees, or the work is profitless. This I have learned by dear experience. A fertile worker is a great nuisance, and difficult to get rid of, but it can be done as easily as anything else, thus: Remove the hive containing the fertile worker several rods from the old stand, and on the old stand place another hive, with a frame of brood and a queen; now take all the frames out of the removed hive and brush off all the bees, and return the frames of stores to the and return the frames of stores to the hive in the old place. The workers hive in the old place. The workers will return to the old home, accept the queen, and it is done.

Washington, Utah.

For the American Bee Journal.

### Robbing Weak Colonies.

S. W. SALISBURY.

The unexpected shortness of the honey crop in many localities seems to develop the tendency of the bees to to develop the tendency of the bees to rob weak colonies. I have tried many expedients described in the books to prevent robbing, with indifferent suc-cess. The easiest and most certain way that I know of is to place a decoy hive, partly filled with honey, be-daubed combs, or undrained cappings, in the place of the hive being robbed, having first moved the attacked colony having first moved the attacked colony a few feet away. After about 10 min-utes I move this colony some distance and give it a new stand. The rob-bers having all left will return to the decoy hive in force, and there continue operations until they consume its available contents, when they will gradually resume natural work. The gradually resume natural work. The bees that belong to the unfortunate colony that return to the decoy hive will finally cluster therein, and can be safely returned to their own colony late in the evening or early in the morning, without loss. In this way I have saved several valuable queens and nuclei, with but little trouble.

Bees wintered without serious loss

in this locality; have done only moderately in the way of honey gathering swarming, and are now mostly . Honey is in fair demand at 20 idle. cents for comb, and 15 cents for extracted.

Kansas City, Mo., July 11, 1881.

For the American Bee Journal.

### How I Remove the Bees from Frames.

I wish to say to "H. F. B." that I as a very soft flat brush to remove the bees from frames and surplus boxes. The brush is  $3\frac{1}{2}$  inches in width with bristles 4 inches long. I do not know for what use it was intended.

Read before the S. W. Wis. Convention,

### Bee-Keeping for Profit.

Profitable bee-keeping is not now carried on as much as it will be when bee-keepers are in possession of more practical knowledge on the subject. It is a business that needs a great deal of study, and considerable physical as well as mental ability to carry it out with profit. The worker bees, the queen and the grone should be well understood in all stages of development, and the nature of each class the bee-keeper should be thoroughly fa-miliar with, in order that he may start on the sure road to success. There are times when caution should be absorbed in handling layer and the be observed in handling bees, and the when and why should be known, and not guessed af.

not guessed at.

Managing bees for study and curiosity is one thing, but making money out of them, year after year, is quite another thing. Keeping bees for a little table luxury is often very expensive, as most classes of this kind over-do the matter, and kill their pets by too much aftention. Keeping bees by too much attention. Keeping bees on a large scale, with a vague knowledge of management is something like a large farm poorly managed considerable expense and small in-

But either bee-keeping or farming on a large or small scale will, and does pay those who have the brains to comprehend the situation, and make all the conditions favorable to success. Bees need more care than the average number of keepers are in the habit of giving them. There are many differgiving them. There are many different cares to attend to, and the neglect of one might prove a loss. Good, white honey, well sealed, should be left in the brood-chamber to last them the year round. Otherwise, if they go into winter quarters with late dark honey, unsealed, the honey is very apt to sour and give them the dysentery, and they die of disease. Worker combs should be kept in the middle of the hive as much as possible, and all drone comb placed in the upper story. A good colony should fill both lower and upper stories of the fill both lower and upper stories of the hive by June in order to obtain the greatest possible amount of honey. Feeding a little liquid honey from the middle of April till June will do a good deal in populating a hive early enough for the honey flow. Swarming means increase of the apiary, and that does not mean honey. If there is that does not mean honey. If there is plenty of forage, and the bee-keeper has help, without too much expense, the increase of the apiary will ill the measure of reasonable expectation. The prevention of swarming means honey. Now, the point, plainly stated, is this: Which will bring us in the most money, honey or bees? If a colony of bees, having surplus honey from the upper story, will bring as much money as their increase, when run for increase, then which course will the most, surely bring us measure of reasonable expectation. course will the most surely bring us profit? From past experience I would run for honey, because the demand for honey is on the increase. Bees are only wanted for honey and wax, and only wanted for noney and wax, and honey and wax only have a commer-cial value, while the value of bees is limited to the producing classes only, and whether there will be a demand depends entirely on unforeseen circumstances.

Success in this business depends Success in this business depends largely on the queens. Old queens should be replaced by young ones whenever they cease to be prolific. With the practical bee-keeper, rearing queens from inferior mothers is almost a few reasons that good providing for the destruction of colories affected with foul brood, which will materially lend encouragement to the industry. The bee moth is very destructive here to weak and queen-less colonies, but in strong colonies there is no danger. Thus far there have appeared no other serious enemies.

I do not know for what use it was manned with the providing a stock of brushes it was mother tended. I found it among a stock with the practical bee-keeper, rearing queens from inferior mothers is always avoided, for reasons that good and prolific queens only are profitable. The real value of good queens is hard in the brush. The bees do not dislike it, as a feather; it never have appeared no other serious enemies.

States. C. C. MILLER, M. D., Lyres. With the practical bee-keeper, rearing queens from inferior mothers is always avoided, for reasons that good and prolific queens only are profitable. The real value of good queens is hard to over-estimate, while poor ones are a positive curse. They are worse than useless. Queens can be introduced at II.

any time during the season, but more any time during the season, not more successfully during a good honey flow. Good queens are known by prolific-ness, and the vigor and activity of their progeny, and are not limited to any particular race of bees, a mix-ture of the different races being desir-

On the supposition that our hives are stocked with good queens, and that at the end of the season we have a large crop of honey, the next prob-lem is successful wintering. Several modes have been practiced, of which many have been quite successful. Yet the past long, cold winter has demon-strated that in the Northern States no strated that in the Northerm States no mode of wintering is proof against loss. Some of you may inquire, what is the best method of wintering? To this I would say, that it is rather delicate to assert any one method as the best mode. I have always wintered mine in a bee-house made for the purpose. It is much drier than a cellar, and so far as ventilation is concerned. and so far as ventilation is concerned, I know the air reaches the bees in a drier and healthier state than in a

Out-door wintering and double-wall hives I know nothing of, having never tried them. Thave been very successful in wintering so far, and so long as I succeed with my bee-house, I shall "let well enough alone." Ventilation sacceed with my bee-flouse, I shall "let well enough alone." Ventilation is, I think, of great importance while bees are in winter quarters; and upward ventilation is the most essential. In preparing for winter, quilts should never be laid directly on the frames, an open space over the frames is indispensable.

It is the best source by which the moisture can escape and the heat be retained; the bees also can have complete access across the frames; the heat is evenly distributed over the brood-chamber, and the bees will re-remain on the frame, instead of clustering in small squads between the combs to chill and die. The above reasons, in my mind, are conclusive on this subject.

on this subject.

In conclusion, I would say to those just embarking in the business, acquaint yourselves with the proper wants of the bees at all seasons of the year, and attend to them, otherwise, better let them alone. Boscobel, Wis.

# COMMING THE AMERICAN - GO ENGLOSS OF BEE JOURNAL

### THOMAS C. NEWMAN.

EDITOR AND PROPRIETOR,

CIHCAGO, HLL., JULY 20, 1881.

Carefully read and study the lessons so emphatically taught by the Statistical Tables on this page.

The 21st St. Louis Fair will be held at St. Louis, Mo., Oct. 3 to 8, 1881, Premiums, \$50,000.

The Patron's Guide, edited and published by Geo. F. Henry, M. D., at Boyd, Ky., commenced its 4th volume this month. It is a well edited and nicely printed weekly, and deserves success.

A New Bee Enemy.—A correspondent in the western part of the State says a small, bright, cardinal bird, something smaller than our common red bird, haunts his bee-hives and devours his bees continually. He wants some of the bee-men to give the name of it.— Furmer's Home Journal.

Does Mr. Newman, of the Ameri-CAN BEE JOURNAL, know anything about this new enemy?—Pat. Guide.

The bird mentioned has a had reputation among bee-keepers. Its peculiarly bright plumage has often led to the error of calling it cardinal bird (Cardinalis Pirginianus), though they may belong to the same family. This bird is also sometimes called kingbird. which is an error. The kingbird (  $\mathit{Ty}\text{-}$ rameus intrepidus) is a small, very stout-built bird, with a short, strong beak, slightly hooked at the point. It is of a bluish color, interspersed with spots of white. It is very combative in disposition, and delights in attacking crows, hawks and eagles while on the wing, which fly to enormous heights to avoid it. Notwithstanding Prof. Cook's enumeration of the good qualities of the kingbird, we always feel tempted to deal summarily with it, as also with the red-bird described, by shooting them on the spot and enlogising afterward.

Beer Adulteration with Glucose. The German glucose manufacturers The German glucose manufacturers have petitioned the Reichstag in reference to the movement to prohibit the use of glucose as a substitute for maltin beer-making. They claim that matth beer-making. They claim that glucose does not make the beer unhealthful, and plead the nonsensical argument that the prohibition would ruin all potato-growers!—*Exchange*.

Of course, philanthropy is a good pretext for all "crooked" transactions. In this country, the manufacunreflecting farmer that without their ited market for corn, prices would be unreminerative, agriculture would come into disrepute, and general ruin have added the results of Dr. Tinker's would befall the country. We are sorry a few-but very few editors NAL for June 8, 1881, but our figures and doctors have found it to their interest to take the same view of the matter, and have displayed the badfaste to attempt to justify the indiscriminate manufacture and sale of glucose and other adulterants.

### Losses of Bees Last Winter.

STATISTICAL TABLE.

To make this Table has been a very difficult task-one that has cost many weary hours of steady brain-work-but as it will teach many a valuable lesson we are well paid. Some omitted important points from their reports, and left us to hunt over their old letters to find out what hive they used or inwhat way they usually wintered, and, in some instances, we had to conjecture whether they were protected or not from the result they reported. The Table is, therefore, necessarily imperfect, but we have done the best we could to wade through the enormous bulk of writing sent in, to ascertain the simple facts in the case.

In the BEE JOURNAL for June 8 Dr. Tinker reported the results of 10,818 colonies. Those he has since received he has sent to us, and they tare included in the following table. which aggregates 521,230 colonies, or about one-sixth of the whole number of colonies of bees in America.

COLONIES WINTERED IN BEE HOUSES Per cent. Dead, of Loss. No. in Fall.

Total.... 252,917 100.271 L'aprotected., 268,313 229,741

Grand total, 521,230

All that were left on the summer stands, but which were well packed with chaff, leaves, sawdust, straw, or otherwise, are included under the heading "Colonies Protected;" while turers of glucose would persuade the those left on the summer stands with chaff cushion or other slight protecassistance there would be but a lim-tion (or none at all), are classed as "Colonics Unprotected,"

In order to make it more perfect, we report, as published in the BertJourshow a vast difference in the percentage of loss, in the different styles of wintering, because our report is so much larger than his was. His report

progressive bee-keepers, as is shown favor of frame hives, by the fact that while his report included only 3,420 hives improtected, those protected by being "packed with chaff, sawdust or other material," numbered 4,103, or 25 per cent. more than the improtected. Our reports generally were made by the progressive bee-keepers, who included all their neighbors in the county or district who had left their bees unprotected, and whose losses were enormous. We report, under the heading of unprotected, 268,313 colonies, or nearly 80 times as many as are included in Dr. Tinker's report, while those protected include 145,883, or only 35 times as many as his.

By the above tigures it will be seen that no bees in box hives were wintered in a bee house: 10.656 colonies in box hives were put into cellars, where the losses amounted to 4,393, or 41 per cent. Only 4,701 were protected, and of these 2,016 perished (43 per cent.), while 13 times as many were left on summer stands unprotected, and 93 the advantage, the Bee Journal out of every 100 unprotected colonies perished.

Some have argued that bees in box hives and log gums were more safely wintered, because the brood chambers were undisturbed, etc., and that, therefore, we should return to old theories, and discard the progressive ideas of the nineteenth century. As we have been to much trouble in getting up the above table, let us investigate what it demonstrates concerning the hives named:

It will be readily seen that while the

results in large apiaries with more but 46-an unanswerable argument in

Those who have contended that the Langstroth hive is too shallow for wintering, will be surprised to learn that the figures compare very favorably for it, thus; the percentage of loss in all kinds of frame bives is 46; exclusive of the Langstroth hive it is 51, leaving only 43 for the Langstroth, being s per cent in favor of the latter.

Again, this report records the result of wintering in 521,330 hives; 211,732 of which were in box hives, leaving 309,598 for all kinds of frame hives. Of the latter, 195,957 are Langstrothsi. c., shallow frames—and 113,561 of all others combined. So, that, in numbers the shallow frame hives reported aggregate nearly double those of all other kinds combined. Thus in numbers, as well as in the least percentage of loss during last winter, the shallow frames have the advantage.

We really think these figures settle the matter of "the coming frame." Had deep frames been shown to have would have been ready to advocate their universal adoption, for it has no desire to favor any but the most successful methods, hives or implements.

To prevent misunderstanding let it be distinctly understood, that all frames nearest in size and shape to the four types of hives named (i, c., the American, Gallup, Langstroth and Quinby) have been classed as such, no matter by what other names they may be called—our only object being to classify so as to make an intelligible statistical table-useful for reference as well as interesting for the student.

Another valuable lesson is taught by the following comparison: Colonies of bees protected by being placed in cellars or bee houses, or by being packed on the summer stands, number 252,917; of these, 100,271 died-39 per cent.; 268.313 colonies were wholly unprotected, but the loss was 229,741-85 per cent.-or nearly thirty thousand more than double the number that died, out of a like number protected!

These figures will illustrate, better than all the arguments imaginable could do, the advantages of rational, intelligent, progressive bee-keeping, and that it remunerates the apiarist to properly prepare his bees for winter. Notwithstanding the diversity of ways of protecting bees, it will be observed their loss was less than one-half that  $\lfloor \frac{1}{62} \rfloor$  of those partially or wholly unprotected. They demonstrate, beyond controversy, that nature and nature's ways are not always best, and that the probabilities of loss are stronger against those who "trust to luck" than those who rely upon a combination of industry and judgment.

We would not taunt the "old fogies" who have kept their bees in box haves and log gums, because nature never made a movable-frame hive for them; but we earnestly commend to their consideration the contrast in percentages of loss-box hives 89, all frame hives 46-nearly double, as reported, We have no doubt, however, the proportion of losses was much greater, as thousands of persons in out-of-theway places have lost the bees in their gums and made no report, considering included some of the most extensive average percentage of loss in hox it no pecuniary loss, as they had never bec-keepers in America, and gave the bives is 89, in all the frame bives it is derived any pecuniary gain from them.

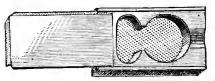

MISCELLANEOUS.

Queen Cages for Mailing. - Mr. Henry Alley, in Gleanings, thus describes the cage he uses:

I shall use a sponge filled with honey instead of sugar candy. Experimenting with candy last year cost me the ing with candy last year cost me the loss of many queens. I do not lose one queen in 50 with sponge and honey. Now I will explain about the cage. It is made  $^5_8$  inch wide, so as to give more space of sponge to the bees, thus making the food hold out longer. In shipping, the tin might press in, but as I make them the tin is on solid against the wood on all sides, and cannot wees in.

In shipping 2, 4, 6, or more queens at one time, I will place the wire face to face, but reversing the sponges, so that the bees in one cage can feed from the sponge in the other. In shipping 3 queens, I will make tin one inch shorter, and cover the sponge with wire cloth, and then the bees in all 3 cages can draw food from their

neighbors. Bees in such cages will live from 2 to 3 weeks. I think the pressure of the wire will hold the sponge in place; if not, drive a sharp place is provided in the sponge in place. Bees in such cages will nail through the side into it. Half a dozen bees to a cage will be all the company a queen will want.

To put bees in the cage, keep up the corner of wire not nailed down, and raise it with the index finger. The spring of the wire will keep it down. own. I have done this all my days.
I can bore the holes in them with

power, and can do it much quicker than I can nad them up. Then again, than I can nail them up. the cages used to-day are much stronger and neater. I have put a few bees in them, and covered the tin with paper to keep the bees away from the cold tin.

Honey Show in San Francisco. - The Semi-Tropic, California, remarks as follows:

The attractive and interesting display, under the anspices of the Bee-Keepers' Association, formed a center around which the apiarists literally swarmed, intent upon investigating the claims of improved machinery, and testing the contents of the various frames and jars, any one sample of which seemed faultlessly clear and dewhich seemed radiclessly deal and de-licious to the minitiated. One hun-dred and two varieties of honey pro-ducing flowers, prepared by J. W. Wilson, of Pasadena, formed a novel and interesting feature of this exhibi-tion. The decorations of white sage tion. The decorations of white sage were tasteful and appropriate, and the nectar itself, in jars arranged in pyramedal shape, clear as crystal, sup-ported by frame after frame of comb honey, snowy and inviting, made a picture which cannot be photographed except by the artist memory.

In connection with this department, Renedict displayed samples of excellent honey vinegar, almost colorless, and above average in acidity several samples of fruit preserved in honey with undeniable success, and 3 kinds of honey cake, which elicited the warmest praise from those who were fortunate enough to secure a sample. It is urged, and very plausibly, that fruit cake made with honey is richer and retains moisture much

the world's market, a life which is too me worm s market, a me which is too retired to attract any but the thought-ful and intelligent, and an employ-ment that is both pleasant and profit-able, we know of no class more enviable than the apiarists of Southern Cali-fornia

The Honey Crop in Ohio.—The Bee-Keepers' Instructor gives the following concerning the crops of honey in the northwestern part of Ohio:

Up to the first part of this month bees were doing remarkably well, taking into consideration the general weak condition of colonies in the early spring. And while we have heard of spring. And wine we have heard of no excessive yields, a pretty fair amount of surplus has been stored, while colonies have been increasing to a limitless extent. There has not been any excessive swarming like we hear of in some sections of the country. Bees everywhere, so far as we have heard, are in good condition, but how long this will continue we cannot tell, as we are now suffering from a severe drouth, which, if it lasts much longer, is going to play havoc with our honey prospects. The white clover is honey prospects. The white clover is dead, and dying; basswood bloom has dried up, and the chestnut, of which we have but little, is about gone. The present indications are that bees will barely gather enough honey for awhile to keep them. Should we have good rains soon we may have a small second crop of white clover. Our main dependence, however, for the rest of the season, will be on fall flowers and buckwheat. So far the season has been very satisfactory. How it will wind up is yet to be seen.

Missouri Apiculture.-In the Independence Sentinel, Mr. C. M. Crandall

In the immediate vicinity of Independence we find the following gentlemen engaged in apiculture L. W. Baldwin has 226 color

. Baldwin has 226 colonies. P. Baldwin has 140 colonies. F. A. Farr has 120 colonies. C. M. Crandall has 75 colonies. Wm. Parker has 80 colonies.

D. Meador has 140 colonies

J. D. Meador has 140 colonies.
The product of these 781 colonies aggregates each year over 20,000 lbs. of honey, which yields not less than \$4,000. But this is a mere bagatelle of the seal bagings. Hundreds of our the real business. Hundreds of our citizens throughout the country have from 10 to 100 colonies of these energetic honey gatherers, and the entire crop must approximate 100,000 lbs. Of course, this mostly goes to home con-sumption, still it is beginning to create quite à handsome revenue.

How to Commence Bee-Keeping. The Northwestern Farmer, published at Portland, Oregon, gives the following very sensible advice:

Successful bee-keeping can be ac-Successful bee-keeping can be accomplished in no other way than by securing large yields of honey. Large yields of honey can be had only by having everything needed ready for securing it. To begin bee-keeping with old-fashioned box or stump hives. with oid-resmoned box or stump hives, and expect to make it profitable, is like killing hens to find eggs. Of course the first thing to be looked after is food or honey, for the bees to gather. If, in the vicinity where it is proposed to keep bees, there are plenty of vielding flowers you are all plenty of yielding flowers, you are all right and ready to go ahead; but it is absolutely necessary to go ahead aright.

Good hives first. Several forms are Good fives first. Several forms are offered for sale at about \$2 each, with movable frame. A honey extractor is as necessary to large yields of honey as good hives. A honey knife for uncapping comb, beeveils, rubber gloves, a smoker, a lot of extra hives, and least theory, not loss a near devoted.

best for the beginner to go slow. A gentleman, resident in the city, whose time is occupied from 7 a. m. to 6 p. m. in other dutics, procured 5 colonics m, in other duties, procured 5 colonies of Italians last spring, and gave them such care as he could. The cost and result of his experiment is as follows: Five colonies at \$40, \$50; 7 new hives at \$2, \$14, or a total of \$61 outlay. He sold 240 pounds of comb honey during the season at 25 cents, \$60, and had 7 new colonies of bees at \$10, \$70. Good as 200 per cent, on his investment.

The Value of System .- The Marshfield (Mo.) News, gives the following notice in its last issue:

The American Bee Journal is on our table, and, as usual, is filled with matter of value to every apiar-Bee-culture is an interest that is of far greater advantage to those who on ar greater advantage to those who engage therein, if conducted system-atically and with proper knowledge thereof, than is usually supposed, and this knowledge can only be gained by studying the habits of these indus-trious insects. The JOURNAL is the trious insects. The JOURNAL is the oldest publication in this specialty in the United States, having been established 20 years, and we can recom-mend it to our readers, who are inter-ested in bee-culture, with pleasure.

The News has our thanks for its kind notice. We shall endeavor to always sustain 'the present flattering reputation of the Weekly BEE JOUR-NAL.

The Crops of the World. —In a country so extensive as America, with climates varied all the way from the torrid to the frigid, the crop of honey will be as diverse as the climate. Speaking of the crops in Europe, we contrast the crop of one country with that of another of the dozen that go to make up the whole. But America comprises as much territory (and diversity of climate) as the whole of the countries of Europe, and crops of all kinds will vary as much, or even more than that of the old world. It is, therefore, not strange to have one pronounce the "crop of honey as unusually large"—that it seems to "rain honey," etc., and another to complain of wet, heat, drouth, and "scarcity of honey"-all are true, and are to be accounted for by the magnificence of the North American Continent.

Of the other crops of the world, the following, from the Chicago Times, will be read with interest:

The world seems destined to reap but sparingly this year. The reports from different portions of this com-try are so uniformly unfavorable that we cannot expect any such barvests as those of the last 2 or 3 years. From as those of the last 2 or 5 years. From Europe the reports were rose-colored a few days ago, but one country after another of the old world is coming forward with doleful accounts of the condition of the crops. The French anticipations of a few weeks ago of being for the first time for some years independent of foreign sympless of independent of foreign supplies of wheat, seem to have been dashed by an unfavorable change in the conditions, for the last reports gave promise of only an average crop, but little or nothing beyond that. A Berlin dispatch says that the prospect is that Berlin dispatch says that the prospect is that the harvest in Germany will be much worse than it was last year, and that the yield will be only <sup>1</sup><sub>2</sub> or <sup>2</sup><sub>3</sub> of the average. Taking all kinds of grain, and averaging the crops and consumption for the past 10 years, Austria produces 550,000,000 tushels a year and consumes 550,000,000 bushels. sample. It is urged, and very plausibly, that fruit cake made with honey is richer and retains moisture much longer than that made of sugar.

Altogether, bee-men have a right to be proud of the honey display in this pavilion. With a product that leads

ian bees. We say a few because it is pretty certain to need forty or fifty best for the beginner to go slow.  $\Lambda$  million bushels of wheat alone, and million bushels of wheat alone, and England is always a large importer. A particularly copious yield in Russia would supply western Europe without creating any exceptional demand from the United States, but as the average surplus of all grains in Russia is 180, 000,000 bushels, while the average net deliciency of Europe is 280,000,000 bushels, the demand for American grain of all kinds must be considerable. If an kinds must be considerable. If we have less to export than usual this year, we shall at least get better prices for what we do export, unless there is a great change for the better in the grain-fields of Europe.

> Old Comb Honey, Candied.-Inquiries are often made as to what to do with old comb-honey that has granulated. Mrs. L. Harrison, in the Praivic Farmer, some time ago, gave the following plan:

When the honey is marketed all unsightly and untilled combs are removed, and we find much of it granlated, so that extracting is out of the question. A bee-sister once told the writer that she put all such comb honey into a pan and melted them in the oven, and that when it was cooled the wax would be in a solid cake on the surface, when it could be removed and the clear below honey would be unloss. the surface, when it could be removed and the clear honey would be underneath. We tried this plan, but the honey was injured by being heated too much. We then tried this way, and succeeded much better: The honey was mashed up in a pan, and set over a kettle of boiling water, and stirred frequently. Before the honey was very hot, the wax had risen to the surface, and being set out in the cold, anickly congealed, so that the warm quickly congealed, so that the warm honey could be poured from under it, through a coffee strainer into another vessel, leaving the wax in the pan. After the honey was melted, the wax was all melted up together, and con-siderable honey of interior quality was under it, which can be kept separate and be used for cooking, making gingerbread, etc. The rinsings of vessels used in manipulating the honey will make excellent vinegar. The wax can be melted in a pan over boilmg water, and should be poured, when melted, through a hot coffee strainer, and when cool will be of a light straw

### Management of Section Boxes.-The Indiana Farmer says:

As the flow of honey slackens off, take from colonies with more sections than they are likely to finish, and put them in place of full sections removed, contracting the room for plus honey, if necessary, so as to have all the sections finished as soon as possible. Beginners are apt to add boxes as long as the flow continues, and at the end of the season have a large number only partially filled, which must be kept over or extracted.

### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

CHICAGO.

HONEY - But little comb honey is yet upon the market, and the quotations are rather premature. New extracted honey is quite plentiful, and in good

Young Bees and Stores for Winter.

—The past winter has forced me to the conclusion that plenty of young bees with good healthy stores are of more importance than any kind of live for wintering. I fed one barrel of coffee A sugar to my weak colonies of hees in the fall, and wintered all of them, while the ones lost were all strong in bees and had forty lbs of honey in the fall, 2 of which were in chaff hives, but I find that chaff hives or cellars will not give a new lease to or cellars will not give a new lease to the allotted days of old bees.

S. E. O'NEEL. Dupont, Ind.

Dysentery, Foundation, etc. — Following is a list of the losses of bees in this section as far as I now know: D. S. had 22, has 4; W. B. had 5, has 3; A. L. had 3, has none: G. B. had 7, has 3; I. F. had 32, has about 12; D. G. had 13, has 2; L. 147, has 1; we 21, have 19. I think the losses are largely attributable to ignorance and carelessness, as we wintered in the same locality on stores gathered in the same fields, and our loss was no more than might be expected any ordinary winter the same fields. On the subject of dysentery am almost confirmed in the belief that an excess of pollen is the cause. We took up 7 colonies last fall, drove 4 in one and 3 in another hive with empty frames, fed them very little houey, and the rest sugar syrup to winter on, having no pollen whatever, and they having no pollen whatever, and they wintered with very little loss and no sign of dysentery, while some of the others, having honey and pollen as they gathered it, were more or less affected. The season so far has been very favorable; white clover is just beginning to yield some honey, and we look for a fair amount of surplus if the weather is propitious during the coming month. If a colony is boxed and swarms out, leaving the boxes partly filled, is it best to leave them on the parent colony or move them on the parent colony or move them with the swarm? Why are full sheets of foundation recommended sneets of Toundation recommended for surplus boxes in preference to only a smail piece for a starter? I have reference to the thin foundation. Pine Grove, Pa. W. II. STOUT.

[The unfilled boxes are usually left with the parent colony. Most beekeepers claim that the foundation is a great economizer of time in building comb, and that the larger the surface presented, the greater the number of bees accommodated; and if, as some of the most expert honey producers assert, the thin foundation is no detriment to either honey or comb, and no imposition upon the consumer, then the greater the amount used to advantage the more profitable its use.

thaff Packing.—1 had 13 colonies packed in chaff which have gone through a rigorous New England winthrough a rigorous New England win-ter without loss, while the hees in box hives were dead before June 1, and also those in the Langstroth hives. With 2 exceptions my bees came through the winter very strong. I have 3 hives with 13 frames in each literally filled with brood, bees and honey; size of frame 12x16, outside measure. I have used this hive since 1873 and have never had a colony die in them; I have found them queen-less and united them with others. One gentleman near here wintered one gentieman near nere withered some 10 or 12 colonies in a cellar and lost  $\frac{1}{3}$  of them. My bees never dwindle in the spring like those wintered in cellars. Others have wintered in cellars and lost none. Bees are working very briskly, and are gathering honey quite fast.

J. T. DAVIS. Shelburne Falls, Mass.

Plenty of Honey.—I had 12 colonies in the spring, and have 30 now. This is the best season for honey 1 ever knew. I shall have 1,000 to 1,500 lbs this season, of a very choice article of honey. 1. P. Wilson, Burlington, Iowa, July 7, 1881.

Loss of Bees in Wanpaca to., Wis.—Agreeable to request, I will report the percentage of loss of bees in this county. I find, by careful inquiry, that those left out unprotected are nearly all dead. Of those chaff-packed and left out, 85 per cent, are dead, and of those wintered in the cellar probably 50 per cent, are dead. In many cases a large proportion of this loss is from spring dwindling since they have been carried out, as in the case of my own bees. I wintered in the cellar with a loss of only 10 per cent, until the first week in April, when I carried them out; since then my loss has been 20 per cent. I now have 35 swarms to commence the season with. The bees in this locality are mostly kept in the Langstroth hive—some in Loss of Bees in Wanpaca Co., Wis kept in the Langstroth hive—some in box hives yet. My own observation tells me that one of the causes of the great mortality among bees the past winter was in not having them protected until after the extreme cold weather came on; then many of them were removed to their winter reposi-My own experience and observation tell me that in the latitude of Northern Wisconsin that it is desirable to winter in a good, well-ventilated cel-lar, so arranged that it can be kept at an, so arranged that it can be kept at a uniform temperature, ranging from 35 to 40° Fahr. If the cellar is not properly arranged they might as well be left out-of-doors. I can, with the multitude of subscribers of the Bee Journal, say that I most heartly velocity to the middle of the subscribers of the subscribers. welcome the weekly receipt of it, and very much appreciate the custom of bee-keepers reporting their modes and plans of managing bees, and the results of their efforts; by weighing their experiences in the balance we may benefit each other.

HARVEY FEATHERS.

Royalton, Wis., May 31, 1881.

Transferring.—Bees have done well here this spring. The swarming is about over, and a great many left for parts unknown—more than usual. Basswood bloom is over, and furnished but little honey. Can a novice transfer bees with safety at this season of the year? I like Cook's Manual very much.

I. R. WAGGONER.
Grantville, Kan., June 24, 1881.

[The best time to transfer is in the spring, but it can be done at any time. Care should be taken not to in-

jure the brood.—ED.]

Short Honey Crop.—I fear that we may have a poor season for honey. Early in the season we had several weeks of continuous rain; now we weeks of continuous rain; now we have a dry season that is equally disastrons to the honey crop. I really did not know the pleasure I was receiving in perusing the Weekly BEE JOURNAL till I failed to get last week's number. I think its weekly visits are far preferable to a monthly, but I must say I prefer a more consequence. venient size of page, for preservation. S. E. Thompson.

Shelbyville, Ky., July 11, 1881.

Snow as Winter Protection. 25 chaff and 17 2-story simplicity hives; I wintered on the summer stands; one was lost by accident and one by starvation: 2 were queenless. Late in the fall the bees were placed in the center of the hive on the few at the start was a late of the live on the few at the start was a late of the live on the few at the start was a late of the live on the start was a late of the live on the start was a late of the live on the start was a late of the live of m the center of the lave on the fewest combs possible; all of the lower story not occupied by bees and all of the second story were then filled with line chaff. A 2-frame nucleus in a simplicity hive thus protected wintered quite finely. In mid-winter I frequently raised the lids and found gicles as long as my fingers on the frequenty raised the has and foling ricicles as long as my fingers on the lower side of the lid; the upper surface of the chaff was wet and moldy.

At 2 inches deep the chaff was dry, and from 2 to 6 inches (according to

the size of the colony) of the chaff next to the bees would not only be very dry, but warm. I did not disturb them during the whole winter, and kept them covered with snow most of the time.

M. Frank Taber.

Salam O. June H. 1881

Salem, O., June 11, 1881.

That Picture.—On the first page of That Picture.—On the first page of the Journal, for July 6, I find truly "a picturesque apiary, designed by Mr. A. I. Root." It is, indeed, a beautiful picture, but it is certainly not practicable. I never saw bee pasturage that would support 450 colonies, profitably in one anions and in age that would support 450 colonies, profitably, in one apiary, and in swarming time it would take 10 men to handle them, under ordinary circumstances; and with had weather for cumstances; and with bad weather for a week, there would probably be 75 to 100 swarms in a single day. The picture is all that could be desired, probably, but I would prefer to see a beenouse in the center space, with a lawn around it, with bees all around, etc. I think Mr. Root is better on pictures than possibilities, or rather, more visionary than martical. It think a visionary than practical. I think a horse railroad should be added to run all around the walks to carry of all around the walks to carry off surplus, provided they get any.

C. F. GREENING.

Grand Meadow. Minn., July 7, 1881.

[The BEE JOURNAL called it picturesque. Mr. Greening says the picture is all that could be desired. Some of the criticisms are right, and just what we like to see. Such a picture, when its faults are pointed out, will make a more lasting impression than pages of words without a picture. We shall all do well to remember the wise saying; "There are flaws in diamonds, flies in amber, and faults in every man." In the discussion of theories we ask no favors, but when we crificise our fellow men let us remember our own imperfections, and chide with love.-Ep.1

Short Crop.—The honey crop in Pennsylvania will be short; June was so wet and cool. Honey is pretty plenty now, but it cannot last long. R. B. Oldt. New Berlin, Pa., July 7, 1881.

My Management,-I have thought sometimes of sending a report to the Journal, not having seen any from this county, and my methods differ so much from the common practice of bee-keepers. I use the Quinby hive, 8 frames and honey-board, no divi-sion-boards, no cushions, no chaff or other absorbents, no upward ventila-tion, the hives ventilated below by raising one inch above the board. On the 18th of Nov., 1880, I put 39 colonies into their room in the cellar unmes into their room in the cellar under the house. It is warm, totally dark, damp, and well ventilated. I put them out March 17; all appeared as well as when put in, but I put them out too soon, and had to double up some of the weaker ones. I have now 34 that are doing well; blacks and hybrids. There are but few bees left in this county. In this township the assessor informed me he found no bees alive except mine. L. EASTWOOD. alive except mine. Waterville, O.

Kingbirds and Drones.—I had heard and read so much about chaff cushions and wintering on the summer stands, that I thought best to try the experiment. One trial is enough for me. By the first of February, 6 had gone to return no more. I put the remaining 3 in the cellar and saved them. Mr. Quinby, in his "Mysteries of Beckeeping," expressed the opinion that the kingbird destroyed only drones. The same sentiment is also expressed. The same sentiment is also expressed in the revised edition. From recent observation, that opinion seems to me

have never noticed drones out early in the morning, and have never known them to collect stores; hence I am of the opinion that the kingbird destroys workers. That his instinct may teach workers. That his instinct may teach him to reject the abdominal portion of the insect, and thus avoid the sting, is possible, but does not help the case. St. Joseph, Mo. S. P. Hyde. St. Joseph, Mo.

My Second Report.—On June 1st I found my number very much reduced to what it was when I reported in February; then my loss was less than February; then my loss was less than 20, but the cold month of April was the hardest on my bees of any part of winter. The 25 colonies in box hives with which I commenced the winter, now number but 3; of 123 in chaff hives I have lost 46 (21 of them being last year's swarms); they died of dysentery, caused by too much unsealed honey; the others died from different causes some from failure of old gueens. causes, some from failure of old queens and some from bad shaped combs. By careful examination I satisfied myself that there was a good cause for the loss, taking into consideration the long, cold winter, which has taught me one of the most valuable lessons of my life. It should cause us all to make more thorough preparations; then if the winter is mild we are all then it the winter is mild we are all right, and if severe, the small amount of extra labor will pay us well for the trouble of eareful packing and securing proper ventilation, which I consider a very important element in successful wintering. J. M. France.

Auburn Corners, Pa.

How to Exterminate Ants, etc.—I notice the request for a plan to exterminate "little black ants" from hives minate "little black ants" from hives of bees. A solution of salt, or dry salt (chloride of sodium), sprinkled where the said ants infest the hives, sends them a "kiting"—an effective means of getting rid of the pests. Try it. Bees love salt as condiment, and I add a pinch of it in their feed. I also notice the request for a receipt for making grafting wax without compounding beeswax with it. A celepounding beeswax with it. A celebrated pomologist published a receipt for compounding a grafting wax made of alcohol, rosin, and spirits of turpentine. I have made and used it, but do not remember the proportion of the ingredients. It has been used the manual properties that it was appropriate that it was appropria of the ingredients. It has been used by many claiming that it was superior C. J. Robinson. to any other. C. J. Robins Richford, N. Y., July 4, 1881.

Honesty and Dishonesty.—Honesty is the offspring of conscience. From this first principle all rules of behavior are drawn. It teaches us the difference between right and wrong; teaches us to shrink from everything evil. to shrink from everything evil. There are some men who seem to have no conscience, who come into the world to seek only pleasure and wealth, and care not by what means they are obtained. It is for such men that we need compulsory honesty, and it cannot be demanded on too broad a scale. Adulteration is not confined to honey Adulteration is not confined to honey. Additeration is not comment to noney. We poisson our drings with cheaper material; we sell shoddy for wool; we sell veneering for solid wood; we rob and cheat each other all around, and in every trade and business; we are rapidly destroying our national sense of beautiful in the second of honesty and integrity. How is it we elect legislators who need petitions presented in order to get them to make laws for the protection of the people? We want laws as broad as the United States, protecting honest and innocent men. We do not want a law shielding honest honey-producers alone, and do not want our law-makers to look at it in that light. We hear the complaints of thousands of other honest men, and we want laws protecting all. There is we want laws protecting all. There is lots of dishonesty in America. Real-ize this, and uphold truth and honesty. A. E. Foster. Covington, Ky.

Repairing Losses.-I have been di-Repairing Losses.—I have been dividing my bees, according to the directions given in the BEE JOURNAL on "Repairing Losses by Division." Had I read the BEE JOURNAL 2 years sooner it would have saved me more than \$200. HENRY ZEIS. Pacific, Mo., June 30, 1881.

### SPECIAL NOTICES.

Single copies of the JOURNAL sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference. ....

When changing a postoffice address, mention the old as well as the new address.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100. ....

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Photographs of prominent Apiarists -Langstroth, Dzierzon, and the baron of Berlepsch.—Price 25 cents each.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

Because it adds to Personal Beauty by restoring color and lustre to gray or faded hair, and is beneficial to the sealp, is why Parker's Hair Balsam is such a popular dressing. 27w4

A Sample Copy of the Weekly Bee Journal will be sent free to any person. Any one intending to get up a elub can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, proposition of the property of the p are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them.

Premiums.—For a club of 2, weekly we give a copy of "Bees and Honey;" for a club of 5, weekly, we will give a Cook's Manual, a Bee-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the JOURNAL for a year free. It will pay to devote a few hours to the Proposition. the BEE JOURNAL.

It is a Foolish Mistake to confound a remedy of merit with the quack medicines now so common. We have used Parker's Ginger Tonic with the happiest results for Rheumatism and Dyspepsia, and when worn out by overwork, and know it to be a sterling health restorative.—Times. See adv. 27w4 ----

It would save us much trouble, if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.—Also, if you live near one postoffice and get your main at another, be sure to give the address we have on our list. give the address we have on our list.

FOR 25 CENTS, A COPY OF ANY BOOK IN THIS LIST WILL BE SENT BY MAIL, POST-PAID, Orders taken now, and books mailed as soon as published. One will be issued every two weeks.

LIFE and ADVENTURES of ROBINSON CRUSOE. This well-known book may be ranked as the most peopular standard juvenile book ever printed. Our edition is complete in one vol. Fully illustrated.

THE PILGRIMS PROGRESS

From this world to that which is to come. This remarkable book, as every one knows, was written under the similit de of a dream, by John Bunyan, the most popular religious writer in the English language; and perhaps more conies have been sold than any other book except the Bible. Our edition is complete and unabridged, with appropriate illustrations.

GULINER S TRAVELS.

The shock tells of the supposed travels and surprising adventures of Lemuel Gulliver into several remote regions of the world, where he met with a race of people to larger than your hand. Also his wenderful exploits among giants. Complete in one volume. Finely illustrated.

THE ARABIAN NIGHTS' ENTERTAINMENTS.

Illustrated with numerous woad engravings, descriptive of those many strange and singular stories which the legend says the Sultaness of Persia related to the Sultan inglit after night, in

The Arabian Nights' Entertainments. Illustrated with numerous wood engravings, descriptive of those many strange and singular stories which the legend says the Sultaness of Persig related to the Sultan inght after night, in order to prolong her life, and thus finally won his affections and delivered the many virgins, who but for her would have been sacrificed to his unjust resentment.

SAVED AT LAST FROM AMONG THE MORMONS. Every man and woman in the land should real this story which is founded upon lacts, and gives an insight into the low estate of woman under the Momon rule.

BREAD AND CHEESE AND KISSES.

READ AND CHEESE AND KISSES.

By B. L. Farieon. A very popular Christmas story after the style of Dickens; abounds in excellent and novel features; is chiefly remarkable for its adminable picture of country life, giving the history of a very happy and contented young couple who thought no lot in life too lowly for the pure cupyment of Bread and theese and Kisses. Complete in one volume, with illustrations.

NOSLE DEEDS OF MEN AND WOMEN.

A history and description of noble deeds, presenting correct and beautiful models of noble life to awaken the impulse to imitate what we admire. By the recorded actions of the great and good we regulate o or own course, and steer, star-guided, over life's trackless occan. Complete in one volume, with illustrations. • over life's trackless ocean.

The usual price of these books bound in cloth is \$1.00 to \$3.00 each. We propose to bind them in heavy paper or thin early board, and send them by mail and prepay the postage, for 25 cen's each. They comprise a wide range and striking diversity of the most brilliant and pleasing projections of the most noted and popular authors, and include books of travels, adventures, for the and humor, so that all tales will be suited. We propose to call it the FARM AND PRESIDE I BRARY, and any one obtaining these ten books will possess a library of ten of the most popular books ever published. We have not room to give a full description of each book, but all will be delighted who obtain the so noted books at so low a price.

THE BOOKS will be the latest and most complete editions, and will contain many illustrations, one alone requiring thirty-nine pictures to complete it.

THE PAGES are about 5½ by 8 inches—the most convenient size for reading and preservation.

THE PYPE is Minion, easy on the eyes. THE PAPER is heavy and of a beautiful white color.

ÆSOP'S FABLES.

THE TYPE is Minion, easy on the eyes. THE PAPER is heavy and of a beautiful white color.

THE FIRST ROOK. Robinson Crusoe, was ready about April ist. One of the others will follow every two weeks and be mailed to subscribers as soon as published.

RELIABLE.—Messrs. Rowell & Co., publishes of the American Newspaper Directory, writing of the publishers of Farm and Fireside, say, "they are accredited by the Mercantile Agencies with a capital of a Million dollars, and are too well known and too much respected to make it worth while to make any statements which are not true." Therefore all are sure to get the above books if careful to direct letters correctly.

POPULAR

# HONEY KEGS.

These kegs answer the popular demand for honey in small packages, and when compared with large barrels bolding from 300 to 500 lbs. each, they are fully as cheap and often cheaper. They need no waxing but should simply be thoroughly scalded with boiling water before using. The leakage so often occurring in the large hard-wood barrels can be entirely prevented by using the White Pine Kegs. Considering the cost and trouble of waxing, the loss of honey by leakage, and the ease with which these kegs can be handled and shipped, with an actual saving in original cost, it must be apparent to all that they are the best. Prices:

50 lb.	Kegs,	each											.35e
100 lb.	Kegs,	6.4					,			,	,		.55c
160 lb.	Kegs,												.65e

# MANUAL OF THE APIARY.

By A. J. COOK,

Of Lansing, Professor of Entomology in the

State Agricultural College of Michigan

320 Pages; ISS Fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineution of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings— the products of the Honey Bee; the rares of bees; full descriptions of honey-producing plants, trees, shrubs, etc., splendidly lilustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bee-keeper, however limited bls means, can afford to do without. It is fully "up with the times" on every conveivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value—L'Apiculture, Puris.

I think Cook's Mannal is the best of our American works.—Lewis T. Colley.

It appears to have cut the ground from under future book makers.—British Bee Journal.

Is a masterly production, and one that no beekeeper, however limited his means, can afford to do without.—Nebraska Farmer.

on without.—Acrossac rutmer.

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the upinty.—J. P. WEST.

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—E. H. WYNKOUP.

This book is just what everyone interested ees ought to have, and which, no one who obtain, will ever regret having purchased.—Mich. Far.

To all who wish to engage in bee culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Herald, Monticello, Ill.

My success has been so great as to almost astonish myself, and unch of it is due to the clear, disnererested information contained in Cook's Manual.—Wal, VAN ANTWERP, M. D.

This book is remunered by the puress and loading

uni.—WM. VAN ANTWERP, M. D.
This book is pronounced by the press and leading becomen to be the most complete and practical treatise on becombiner in Europe or America; a scientific work on modern bee manugement that every experienced bee-man will welcome, and it is essential to every amateur in bee-callure. It is handsomely printed, neatly bound, and is a credit to the West.—Western Agriculturist.

This work is indoubtedly the most complete

to the West.—Western Agriculturist.

This work is undoubtedly the most complete manual for the instruction of bee-keepers which has ever been published. It gives a full explination regarding the care and management of the apiary. There is no subject relating to the culture of these left untouched, and in the compitation of the work Prof. Cook has had the advantage of all the previous knowlede of apiarists, which he uses admirably to promote and make popular this most interesting of ulloccupations.—American Inventor.

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—Ky. Live Stock Record.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—A. E. WENZEL.

richest reward awaits its author.—A. E. WENZEL.
It is a credit to the author as well the publisher.
I have never yet met with a work, either French
or foreign, which I like so mench.—I/ABBE DC
BOIS, editor of the Bulletin D'Apiculteur, France.
It not only gives the natural history of these indistributes insects, but also a thorough, practical,
and clearly expressed series of directions at their
management; also a botanical description of honey
producing plants, and an extended account of the
enemies of bees.—Democrat, Pulaski, N.

producing plants, and an extended account of the enemies of bees.—Pemocrat, Pulaski, N. Y.

We have perused with great plensure this rade mecan of the bee-keeper. It is replete with the best information on everything belonging to aniculture. To all taking an interest in this subject, we say, obtain this valuable work, read it carefully and practice us advised.—Agriculturist, Quebec.

It may safely be pronounced the most complete and comprehensive of the several most complete had comprehensive of the several meanuals which had been the structure of the bee, the different varieties, the various bee products, and following these the points of management, extending to the smallest details, are all of biking and practical value. Prof. Cook has presented the latest phases of progressive here keeping, and writes of the themes discussed in the light of his own experience.—Pactic Rural.

Of the many excellent works which we have examined on bee-culture, we consider Prof. Cooks he most valuable for the study of those who contemplate going into the business or are already keeping bees. If thoroughly studied, and its teachings conformed to, by the aparist, who exercises a reasonable degree of common sense, he or she cannot fail to achieve at least a reasonable degree of common sense, he or she cannot fail to achieve at least a reasonable degree of common sense, he or she cannot fail to achieve at least a reasonable degree of common sense, he orshe cannot fail to achieve at least a reasonable degree of the work with a degree of cultusinsm which carries the reader with him to the out.—Kansus Fathere.

Cook's Manual of the Apiary holds in America.

the reader with him to the end.—Kansas Farmer.
Cook's Manual of the Apiary holds in America
the same high rank, that is accorded in Germany
to the book of which Dzierzon is the author; the
only difference being that Prof. Cook's Manual
combines the profoundness of the German pastor
with the superiority of the practical American.
He refers in several instances to Darwin; and
does not belong to that class which hates everything that is foreign, for he speaks of German natmalists with great reverence,—German Freidenker,
Milwankee, Wis.

### TERMS OF SUBSCRIPTION:

WEEKLY-(52 numbers) \$2 a year, in advance.
Three or Six Months at the same rate.

SEMI-MONTHLY—The first and third numbers of each month, at \$1.00 a year, in advance.

MONTHLY—The first number of each month, at \$50 cents a year, in advance.

Any person sending a club of six is entitled to an extra copy (like the club) sent to any address desired. Sample copies furnished free.

Remit by money-order, registered letter, express or bank draft on Chicago or New York, payable to our order. Such only are at our risk, Checks on local bunks cost us 25 cents for collecting.

Free of postage in the United States or Canada. Postage to Europe 50 cents extra.

Entered at Chicago post office as second class matter.

Read before the Entomological Society.

### Relation of Apiculture to Science.

PROF. A. J. COOK.

I once heard a well-known professor and scientist, than whom there is no better student of American agriculno better student of American agriculture, remark, that the art of agriculture was founded almost wholly upon empiricism; and that all it had to thank science for was that the latter explained what had already been determined by the empiric method. Whether this be true or not, the reverse is most certainly true of practical entomology. Economic entomology tical entomology. Economic entomology rests almost wholly upon science. ogy rests almost whony upon science. Fear deters most people from beekeeping, unless a desire to study bees, and to know more of the nature and habits of these marvels of nature, impels to that close association with bees, which practical apiculture demands

For this reason, there is no class of men engaged in manual labor pursuits which possesses the intelligence

we understand why science has gleaned so much from practical apiculture. The nature of the several bees in each colony, as to sex, function and longevity, is now well known to every intelligent apiarist. The peculiarity of queen, drones and workers, and the peculiar duties of workers of dif-ferent ages, are matters of daily ob-servation. servation.

The queen is seen to lay 3 or 4 eggs The queen is seen to fay 3 or 4 eggs per minute, and the apiarist, by adding comb with empty cells, proves that she may lay as many as 4,000 eggs der day. Aristotle was correct, then, in calling the queen the mother, and Virgil wrong in pronouncing her to be the king. Her hatred to rivals is easily shown by the certain combat, fatal to one of them, when two oneens fatal to one of them, when two queens are placed together. This enmity induces swarming, as bees rarely suffer a plurality of queens in the same hive. a puranty of queens in the same mye. In swarming the queen never leads, yet the special place of clustering is usually determined by the queen. Unless the queen accompanies the swarm, the latter will always return to the hive.

By ellipsing one wing of a virgin

By clipping one wing of a virgin queen, so that flight will ever after be impossible, the bee-keeper quickly proves the correctness of the great Huber's discovery, that queens always mate on the wing. The same experiment proves the correctness of Dzierzon's more wonderful discovery experiment proves the correctness of Dzierzon's more wonderful discovery, that drone bees are a result of agamic reproduction. No queen whose wing is clipped while yet a virgin, so far as I have observed, and I have tried the experiment many times, will ever lay eggs that will produce other than drone bees. It is also true that if a queen is forced to virginity for 3 or 4 weeks, she will always remain a virgin. Upon the queen's return from her

Upon the queen's return from her mating flight, we may observe the evidence of success, as she always if successful hears away a portion of the drone's reproductive organs, which remains the successful to the productive organs. nain attached to the queen for some hours.

It was a theory of the late Samuel Wagner, that the placing of unim-pregnated eggs in the larger cells of the drone comb, and the impregnated the drone comb, and the impregnated ones, in the smaller worker cells, was simply automatic. The pressure of the smaller cell upon the queen's abdomen, forced the sperm cells from the spermatheca, as the eggs passed by. As there would be no such pressure from the larger drone cells, the spermatoza would not be extruded from the spermatheca. Practical beekeepers have shown this to be instruc. Oneens have been seen to lay eggs

Queens have shown this to be a Queens have been seen to lay eggs in the still larger queen-cells, which are always impregnated. The queen in the still larger queen-cells, which are always impregnated. The queen often lays in worker cells, where the walls are but just commenced, and where there is no compression; yet such eggs are always impregnated. That the bringing of the sperm cells into connection with the germ cells, or the withholding of them, as the eggs are to produce females or index, is a matter of volition with the queen, is sustained by the muscular character. men engaged in manual mana, pursuits which possesses the intelligence and enthusiasm which characterize apiarists, or which practices so much that is really scientific. The successful apiarist of to-day must be able to inspect every part of his hives; must be constantly familiar with the precise condition of every colony of his bees; must be possessed of quick and accurate powers of observation. Thus we understand why science has gleaned so much from practical apiculture.

The nature of the several bees in each colony, as to sex, function and longevity, is now well known to every intelligent apiarist. The peculiarity of oneen, drones and workers, and

An anomalous physiological fact is illustrated in the flight of the queen when swarming takes place. Though she may not have used her wings since

her marriage flight, possibly for two

her marriage flight, possibly for two or more years, yet the muscles are by no means atrophied, as shown by her rapid flight, often several miles, en route to her future home.

The reason why a few impregnated eggs develop into queens, while thous-ands of the same produce worker bees, appears to be wholly due to quality and quantity of food. The enlarged cell appears to be whony due to quality and quantity of food. The enlarged cell is necessary to a full-sized queen, but not to a queen. The exceptional posi-tion of queen-cells is simply for con-venience, as it is not inventor. venience, as it is not important.

Direct observation, as also her re-

moval from the hive, shows that the only function of the queen is to lay

Thave known queens to lay with no abatement of fertility for 5 years, though often in one or two years she ceases to be prolific, either from her own impotency, or from a depletion of the spermatheca, in which case only drone bees are produced. Usually the worker bees arrange to supersede the queen before she becomes an exclusive drone producer.

crone producer.
Common observation proves that the drones are males, that they are great eaters, and that they have no function in the economy of the hive, except the sexual function. As always to the sexual function are provided to drong the sexual transfer of the sexual function. ready explained, the drone loses a portion of his reproductive organs, in mating, which is attended with im-mediate death.

Though doubt is sometimes expressed as to the origin of drones by parthenogenesis, there is no such doubt among intelligent apparists. If doubt is sometimes exdoubt among intelligent apiarists. If the wing of the virgin queen is clipped, or the entrance to the hive so contracted that she cannot fly, or again, if she is reared when there are no drones, she will be, not sterile, but from her eggs will come only drones. Often these will be in the small cells, when the drones will be nolonger than the workers. The eggs from fertile worker bees, and also from old queens, with depleted spermathecas, will likewise produce only drones. In appearance and structure these drones are every way normal. I have no doubt

ance and structure these drones are every way normal. I have no doubt but that they are functionally perfect. There is an interesting fact connected with the appearance and disappearance of drones, whose explanation seems to call for an intelligence above instinct As the colonies become very populons in spring, the worker bees build drone comb, and rarely even tear down and replace worker with drone cells, and the queen lays the unimpregnated eggs in such lays the unimpregnated eggs in such lays the unimpregnated eggs in such cells, preparatory to rearing queens, and to swarming. If we remove a queen, none but drone comb will be built. Now suppose a colony is strong and preparing to swarm, and suddenly, from lack of bloom, continuous rains or great drouth, the secretion of nectar suddenly stops. Honey gathering of course ceases, brood-rearing is discontinued, and, not infrequently, the bees kill all the drones, and even drag the larvay and the pupa from the cells. the larvæ and the pupæ from the cells. As soon as the honey harvest is hopelessly cut short by the autumn frosts, the worker bees commence at frosts, the worker bees commence at once to bite and worry the drones, till the latter are driven forth to die. But if the colony be queenless, or if the

queen has become superannuated, the drones will be permitted to remain in the hives all winter. The fate of the the hives all winter. The fate of the drones hangs on the prosperity of the colony. With rapid increase of bees and honey they are safe; adversity in these respects, unless caused by loss or impotency of the queen, betokens their speedy extinction.

Drones are tolerated in a strange

colony, which is not generally true of either the queen or the workers.

The longevity of drone bees, as we have seen, is largely dependent upon circumstances. There is good reason to believe that they may live through

the entire season.

The worker bees are imperfectly The worker bees are imperieurly developed feunales, which from receiving less and different food while larvæ, are immature in their sexual development. A worker larva, less than 3 days from hatching, will, if given more and richer food, develop into a queen. If an apiarist allows a colony to go queenless for a long time, fet-tile workers are almost sure to ap-pear, from whose eggs, however, none

but drones are produced. Some api-arists suppose that such workers receive, perhaps by accident, a richer and more abundant pabulum. I have wondered if this might not verify Lamarck's idea of evolution. The Lamarck's idea of evolution. The bee desires eggs, and the deeply felt want induces the extra ovarian devel-

The worker bees are shorter than The Worker bees are should than the drones and queen, and less robust than are the drones. Their wings are small but strong, and move very rapidly in flight. When the bees are angry the rapidity is still more marked, and there is a corresponding impact of with to the hum.

marked, and there is a corresponding increase of pitch to the hum.

The workers, as the name implies, do all the work of the hive, hence a reason for their better developed manreason for their better developed mandibles, with which they cut comb, remove cappings and dig pollen from the cells; their longer tongues and maxille, with which they extract nectar from deep hubular flowers, and the deep baskets on their posterior tibia and basal tarsi, which are wanting in the queen and drones, in which they carry pollen and propolis to their hives. As they protect the hives from intrusion, they need and possess a better developed sting than that of the queen, which is only used in dispatching rivals.

By the introduction of Italian bees,

By the introduction of Italian bees, which differ greatly in color from the German or black bees, bee-keepers have learned that the old bees, for the have learned that the old bees, for the most part gather the honey, pollen and propolis, while the young bees remain within the interior of the hive and secrete the wax, build the comb, feed the broad and cap the broad cells, though the old bees will do the work of the young ones if for any reason the natural equilibrium of the colony is destroyed.

That bees possess and use the sense of smell is obvious to the apiarist. It he unite 2 colonies, they often engage in fierce combat, which only termi-nates when one of the parties is van-

have been led to notice a strange exception to this; by placing honey on a porch of one or two houses that are exactly alike, but about 5 rods apart, exactly alike, but about 5 rous apart, many bees were misled and swarmed about the porch on which there was no honey. The experiment was several times repeated.

Experience shows that bees will winter quite as well with pure honey or sugar symp for food, as though they had pollen with it. They may be kent healthy at least for a time in

be kept healthy at least for a time, in confinement, in summer, on a pure hydro-carbonaceous diet, and will se-crete wax and make comb with the crete wax and nake comb with the usual activity. But pollen is a  $\sin \epsilon$  qua non to brood-rearing. Probably it is also necessary for the old bees, at times of great activity. Bees also need water. Unless very active, this want seems to be met by the water of the honey; but in shipping bees they are now generally fed with candy or crystallized snoar and unless water is crystallized sugar, and unless water is

added, they perish in a few days.

Nectar, as gathered from the dowers, contains much more water than does the honey. The bees leave the does the honey. The bees leave the nectar, which is often nearly as thin as water, some time before capping, until the necessary evaporation has transpired. Bee-keepers call this the curing process. Some nectar is so thick that it is capped very soon, though frequently it remains for days, and rarely is it of such a nature that and rarely is to 1 such a nature that it does not thicken, and the bees refuse to cap it at all. Such nector, usually from bark lice, etc., is unwholesome, and unfit food, even for the bees. If thin nector is extracted, here becomes accounted the maisture the bees. If thin nectar is extracted, bee-keepers evaporate the moisture from it by artificial heat, as it does not preserve its quality unless rid of

One of the most terrible disasters that can befall the apiarist is to become the victim of foul brood. In this terrible disease a fungus attacks the brood, which causes it to become putrid and disgusting. It is very contagious. The disease is common in tagious. The disease is common in Europe, and has brought ruin and dis conragement to apiarists in several of our own States. Spraying with sali-cylic acid has been found an efficient

eure.

The enemies of bees is certainly a matter of much interest to all scientists, and especially to zoologists. Among mammals, shrews and mice are often quite destructive to bees. The kingbird, Tyronous Carolinensis, captures worker bees, although it is certial to design. partial to drones. Toads and frogs seem to lap up bees with no inconsiderable relish, and often work quite successfully to deplete the hives.

successfully to deplete the hives.

Bees have many and formidable foes among insects. In the order Hymenoptera, a species of Xylocopa, probably X. micans, has been observed to kill bees in North Carolina. The cow killer, Matilla coccina, destroys bees in the States from Central Illinois to Texas. It has been reported several times that ants are at times a serious for to the honey bee. It is stated that they not only worry the bees by invading the hive, but that they sometimes kill both the queens

and workers.

The only lepidopterous insect which annoys American apiarists is the beemoth, Galleria cereana. And even annoys American apiarists is the beenoth, Galleria evenue. And even this is no dread to the intelligent apiarist. It is found that strong colonies of bress—and none others payand especially if Italians, will always defend themselves against this enemy. It is only weak or queenless colonies that succumb to this foe.

Among Diptera, Bombylius Mexicanus, is reported to enter the hives, in Texas, without resistance and lays its eggs, where the prospective larvawill be nourished and cared for, without labor on the part of the mother

harmony is secured. The same fact leads to somewhat similar precautionary measures in introducing queens.

In going to any place, bees seem to be guided by direction rather than of Erax, that eatch and kill bees, sight. Thus if we move a hive, but These predactions flies work the most for one or two feet, the bees will, for days, descend to the old position, and then turn abruptly to the hive. I have been led to notice a strange exempt from blame even as far North as Ontario, A parasitic fly of the family Tachinidae is destructive to bees in several of the States.

In going to any place, bees seem to 2 of Promachus, 2 of Laphria, and 2 and exclusive worker cells.

Agricultural College, Lausing, Mich.

These predactions flies work the most serious dipterous pests to the apiarist. Of these there are at least and exclusive worker cells.

hees in several of the States.

In importing bees, the bee louse,
Braula voca, has been introduced
from Europe; but so far it promises
to do little harm in our country.

Amongst Heteroptera, Phymota
crosa is a dreaded foe of the honey
has Even its close principle of the

bee. From its close mimicry of the flowers of many composite plants, in which it is wont to hide, it finds it easy to grasp the bees with its unique anterior legs, when it soon sucks out their life juices. *Mantis corolina* kills bees from Central Illinois to the Gulf.

Many of the Libellulidae, chief among which is Anax junius, are so fierce in their onslaught on bees, that they have been termed bee-hawks. These maranders depredate in all sections of contemporary and the section of contemporary and cont

tions of our country

I need not speak, at this time, of the value of bees in fertilizing flowers, as that has been ably discussed by our botanical friends. That bees ever injure buckwheat or other plants, by seeking nectar from their bloom, as is sometimes claimed, is known to be erroneous by all present. That they are equally harmless to grapes and other soft-skinned fruits is not so and other soft-skinned fruits is not so generally granted. Personally, I have never seen a case, though I have several times gone quite a distance to see them at the request of positive individuals. In each case the bees were found never to attack sound fruit, but only to sip from such as had burst, or been torn by other insects or by birds. While I am not positive that bees are never guilty of such wrong-doing, 1 do feel certain that such actions if ever true, are quite exceptional. I have lived in Califor-nia in the midst of apiaries and vine-

nia in the midst of apiaries and vine-yards, and I have yet to see the first case of such depravity among bees. The 2 great improvements in api-culture since the Langstroth hive, and scientific knowledge gave the apiarist such control over his bees, are the extractor and comb founda-tion, both of which are recent inven-tions. In both cases the thought came from Germans, but perfection in car-rying it out is due to Yankee genins. The honey extracter works on the

rying it out is due to Yankee genins.

The honey extracter works on the principle of centrifugal force, and by its use honey may be thrown from the combs before it is capped over, or afterward if the cappings be first removed with a knife. By this practice the comb is used over and over again, and are appeals at least trigon, and and as a result, at least twice as much honey can be secured. Experiment of honey that it takes at least 20 pounds of honey to secure one of comb, besides the time of secretion is lost, as bees are usually quiet when employed

in secreting the wax-scales.

Extracting is often very necessary to furnish room for the queen, so that she may lay eggs. In times of great honey secretion, the workers so fill the cells with honey that the queen finds no place for her eggs, so brood-rearing ceases, and as the workers live only for a few weeks during the active season, depletion of the colony is rapid and sometimes is carried to a fatal

extent.
When bees cease gathering, from when oees cease gathering, from lack of nectar secretion the queen stops laying, and all brood-rearing ceases. Nothing is found to pay the apiarist so well as to feed sparingly, whenever there is a cessation from gathering honey, and so keep his col-onies strong. The extracted honey onies strong. The extracted honey furnishes a cheap and excellent food

for this purpose Comb foundation is made from pure beeswax and is a perfect copy of honey comb, as just commenced by the bees, except that it is much thicker. When given to the bees, they at once accept

For the American Bee Journal.

### Poor Crop, Wooden Separators, etc.

JAMES HEDDON.

A May drought put white clover back so it lapped over on basswood; the latter yielded honey very mode-rately, and for a short time only. We could hardly tell when it commenced and left off. I report the white honey and left off. I report the white honey crop (which is usually about  $^{2}_{3}$  of all) as not over  $^{1}_{3}$  of a crop here. We now look forward to fall flowers. "Hope on, hope ever," "Man never is, but

always to be blessed.

Messrs. Greiner Bros. say their bees Messis, Greiner Bros, say their bees are just going for the side boxes and almost neglecting the top ones, and that this individual experience of theirs is better argument than any philosophy. Yes, it is to them; but Mr. Demaree says that he is "sorry that Mr. Demaree says that he is " that Mr. Heddon asserts that bees will attach the comb to wood separators, because it indicates he writes about some things about which he knows but little." I had used wood separators, little." I had used wood separators, and know of their being thrown aside and know of their being thrown aside by others. It is my duty, as a stranger to Mr. Demaree, to try to point out to him that there is philosophy in sup-posing that bees would not be as likely to attach a comb to a substance that was moist with condensation, so hard that the bees could not move the first particle of it when they wish to lay the first scale of wax with which to make a "brace," and a substance entirely foreign to them in a natural state, as they would to wood, which is their time-honored housing. I ought to try to show him that the main reason why tin is objected to, is a good reason why the bees will not be so likely to attach bits of comb to it, to leak and muss up our surplus when removed. I ought to ask him if he has not found out that even painting a surface tooks to recover could at a surface tends to prevent comb attachments? To convince him, I am too far off; his experience is close by, and his reason still closer.

Dowagiac, Mich., July 13, 1881.

### Cleome as a Honey Producer.

D. S. GRIMES.

My hobby has always been trees nits and flowers, but 3 years ago 1 added bees. Although ignorant and inexperienced in the business, I found them an interesting subject of study and soon learned to love them on account of their intelligence, industry and the sweet stores of honey prorided for our table, here in an altifude high and dry.

In reading the experiences of the

correspondents of the BEE JOURNAL I have learned much. Since I learned to treat bees with gentleness and common-sense, my daily pilgrimage through beds of flowers and blocks of nursery stock, on the double-quick, driving a few angry bees around, has ceased—we understand each other better. I have learned, also, that when bees find but little honey to gather,

bees find but little honey to gather, and are hungry, they are cross.

Last year I had 40 colonies, but my manipulations in dividing and wintering destroyed half of them. I have the 40, save one, again—strong and healthy (thanks to the Bee Journal and Mrs. Harrison)—now gathering and storing large quantities of excellent honey from cleome, the Rocky Mountain bee plant. Were it not for this valuable honey producing plant, bees in Colorado would find poor picking from now on. As the bloom of the raspberry, white clover, and wild its eggs, where the prospective larvae it, thin it to the usual thickness of will be nourished and carrel for, without labor on the part of the mother of the mother of the family Asilidae affords the land work of wax secretion and comb the raspberry, white clover, and wild a bright-yellow color, brownish head

flowers of the plains pass out of sea-son or dry up, then this bee plant commences to bloom, and continues commences to bloom, and continues to grow and bloom until cut off by frost. To the apiarist this plant promises a valuable future, and should be better known. The seed being almost as heavy as mustard seed the wind will not blow it away, but it remains where it is first sown, preferring the read side or wards above. the road-side or waste places, where the plow and hoe are not used. Bees probably do better in the parks and valleys of our mountains than around

Denver, on account of the large quantity and variety of flowers found there.

There is a plant growing all over the Rocky Mountains, up to the snowline, the mountain people call it "kin-icanick" (I do not know the botanical name). This plant has small, thick, dark-green leaves, growing that on the ground, covering the earth like a green earpet, producing a small white flower in early spring, which continues in bloom a long time. From this plant bees find pasturage equal to white

A boarding house keeper, on Bear Creek Canyon, at an altitude of 10,000 feet, has a small apiary doing remarkably well. He has never had a case of dysentery, or any other disease, among his bees, and his honey is equal to the best California. Success to the BEE JOURNAL.
Denver, Col., July 16, 1881.

For the American Bee Journal.

### Stingless Bees of South America.

C. A. HARDEY, M. D.

DEAR EDITOR: In compliance with my promise, I send you a description and history of the stingless honey bee, as seen by me in Mexico, from notes as seen by me in Mexico, from notes made by me while there. This bee, slightly differing in size and color, is found in the heart of the dense forests of the middle and southern parts of Mexico, and all the States of South America. It hangs its hive or nest them between the states of south sta upon branches of trees, like the Apis dorsata is said to do in Java and the islands of the far East. This nest is composed of nearly the same material as that of the large yellow hornet, is pear-shaped in form is from 18 inches to 3 feet long, and from a foot to 20 inches in diameter, is divided into partitions, or portions, not unlike an orange, with passages an inch wide running from top to bottom, of very thin material, like gray or brown There are one or more entrance

holes near the top, each protected by a cap or portico from rains, with one or two holes at or near the bottom for exit; these holes are about 14 inches wide, and are large enough to permit

wide, and are large enough to permit several bees to go in or out at once.

The hive is suspended by 2 or 3 ligaments of strong librous material, slightly elastic, permitting the gentle balancing of the hive from the action of the wind. The hive is thoroughly water-proof on the ontside, somewhat rough, of a brown or grayish brown color; on the inside it is smooth and of a delicate yellow, and extremely of a delicate yellow, and extremely clean. The honey cells are elongated, about  $^{1}_{2}$  inch in diameter, rounded, and slightly perpendicular, and about t inch long. The brood-cells are slightly less in size— $^{3}_{4}$  of an inch long and  $^{3}_{8}$  in diameter—they are placed like gently rising steps, one above the other, adhering to each other by one side. Some of these water are very large and heavy; some other by one side. Some of these nests are very large and heavy; some must have weighed 100 pounds. The cells are situated always

site each other, that is, are attached to opposite sides of the divisions, with holes here and there for free

passage.

The workers are about 12 inch long, of a yellowish color, strongly made, black head, black crescent on the back, with white bars in the corselet divisions, have very long tongues and strong mandibles—their only defense—which

with white star in forehead, is very with withe star in foreign, is very corpulent and very quiet, unless disturbed by a blow upon the nest or a violent wind. These queens did not move nutil the combs were taken out, then, after flying around a little, they returned to the hive or nest.

The dropes or males resemble the

The drones or males resemble the workers in color, but have the white star like the queens. Both the drones and queen have yellow bars upon the arrelate but the star like the greens. and queen have yellow bars upon the corselet, but those of the queen are of a golden-yellow, inclined to azure. The drones are about 5g of an inch long, very corpulent, and apparently very indolent. The workers are very active from sunrise till about 11 o'clock they then cluster about the nest or

The honey is very rich in taste in the spring, but I am told that in the latter part of the season it will cause vomiting and purging in certain places, where the wild locust and jes-

samine are abundant.

The bees may be found in the dense The bees may be tollin in the dense forests and chapparals from near Matamoras to San Louis Potosi, and perhaps to the Pacific. I found them at Matamoras near Lago del Muerte, near Reynosa, in the mountains near Monterey, and in the regions along the route from Monterey to San Louis Po-tosi, also at Monclova. They may be found in the regions around Tampico, in Gautemala, Brazil, and other South American States. The natives sometimes bring the nests for sale, honey and all; the holes of entrance and exit closed with a plug of grass, and nest swung upon a pole over the shoulder.

shoulder.

Might not this race of bees be erossed with the Italians or Cyprians? Will they endure our winters? They are very gentle, never even biting

unless abused.

Tremoved the honey from the nest by simply slitting upon the outside covering or ease, turning a portion back and cutting out the part wanted, the bees flying around making a noise something like that of the common humble bee, though a little sharper, lighting upon the person and crawling around with great activity and exeitement. These nests are difficult to find and are always in the deepest and most shaded parts of the forests. Chataignier, La., July 12, 1881.

[We see no object to be attained by crossing the stingless bees with the improved bees we now have, even if it were possible. They are quite small, and not at all suited to our climate. Their severe "bite" might prove more objectionable than the stings of Italian bees; or the crossing might develop "business" qualities at both ends. We do not think we want the stingless bees.—Ed.1

### The Bee-Nuisance Question.

J. H. MARTIN.

I think, in relation to this nuisance question, that Mr. Heddon does not take into consideration the fact that the case I mentioned was located in a little hamlet of half a dozen houses, and only 2 or 3 families were afflicted with bee stings. I think in that, and all similar cases, an interchange of neighborly civilities would have healed all pains. It I give my neighbor a pound of honey he will, in due time, return the favor, unless he belongs to that class of four-footed beasts which once ran down a steep declivity into the sea.

I not only give to my neighbor, but his family sometimes, during the ex-

ruined. If those boys had been fed judiciously they would have been helpers instead of destroyers. The motive of giving may be termed fear, or selfishness, but we think the little rule: "Do to others as you would have others do unto you," covers thecase. When an apiarist gets so penurious that he cannot part with a few onnecs

that he cannot part with a few ounces of honey, he belongs to that four-footed class above referred to. Not to be misunderstood, I refer only to lone misunderstood, I feter offly to forealities in the country, many miles from large villages. It I were located in such a place where the giving became a wholesale transaction, I, too, would choose who should be the re-

cipient of favors. In all these cases of nuisance, when applied to bees, one fact is very prominent. The bee-keeping business is looked upon by the majority of peo-ple as a small occupation—"fussing with bees" is the usual term applied with bees is the usual term applied to it. Our neighbor runs a dairy of 20 cows, and who ever heard of a man "fussing with cows?" His manipu-lation of cows' udders brings him in \$400 or \$500; our bees net us as much with less foddering. Still his dairy is a big thing, and is getting to be of so much importance that the Goldess of Liberty should have a roll of butter in one hand, a cheese in the other, and

ealf tied to her apron strings.

We find, in nearly all cases of nuisance, it is that which causes injury to people that is complained of. A stench, that carries disease and death with it. from any cause, is soon abated. and when a person gets stung and has to call a physician he does not think of your one or two thousand a year, it is of the danger to himself. Our bees might roar every day, the year round, and no one would call them a nui-

Those logs Mr. Heddon speaks of Those logs Mr. Heddon speaks of are very harmless, but arm each one with a spear, ready to pierce the trav-eler, and the mill and its surroundings would soon be denominated a mi-sance. The same with the steam-whistle, if it caused pain or swelling in the ear you would soon hear no more of it, but as we are a 4th-of-July intion, the praigrify of us like a good more of it, but as we are a 4th-of-July nation, the majority of us like a good deal of noise. In conclusion, we think we are greatly blessed by having our bees located in the quiet country. We have none of those opulent, purse-proud, selfish families for neighbors. We all stand upon a common level, and can interchange courtesies without majore of fearour selfishmest. it motives of fear or selfishness. Hartford, N. Y.

### Wintering Bees without Loss.

D. S. BASSETT.

I am well aware that the subject of wintering bees is rather old now, but as we shall soon have to go through with it again I thought no barm in telling you how I have done for the last 4 winters, without the loss of a single colony. I have but few colonies but how then just as well as I know how. Last winter I had 9. 1 increased by natural swarming to 19, and did not feed them, either. Now I have 30 from the 9. My bees are very hardy, I think. My first experience in wintering bees was in lox hives, and since that in Root's chaff hive, using oat chaff altogether. 1 hive, using oat chaff altogether. It put the bees on as few frames as possible, with plenty of sealed honey, and use a division-board made of lath, thin boards nailed on one side and duck on the other. I put the duck next to the bees, in winter, filling all the space between the division-board and the hive with loose chaff. 1 put 2 thicknesses of Java canvas over the I not only give to my neighbor, but last family sometimes, during the extracting season, come into my apiary, and I give them of the fruits of the time; but a few ounces are consumed, and it is a pleasure to us to see them get satisfied. A bee-keeper in an adjoining town adopted the plan of kicking and stoning boys who came near his bees; the result was that one morning several hives were found tipped over, and the colonies nearly last the large chaff cushion on. In 2 hives the loose chaff became rather damp in February, and I changed it courage brood-rearing. Those bee-keepers that still use rolling in very fast, but just enough to enurge brood-rearing. Those bee-keepers that still use rolling in the seriled in the BEE Journal some time ago, and I think they can do it more easily and quickly, and also more easily and quickly.

nice to have one every week, and especially one as good as the AMERICAN BEE JOURNAL. You may put me down as a subscriber as long as I keep bees, and I wish its editor health and

Farmunsville, Mass.

### The Honey Crop in California.

J. D. ENAS.

About the last that I wrote to you regarding our honey crop was a fav-orable prospect for a good supply of the nectar; that was at the beginning of the season. The prevailing idea now among the majority of honey producers is that we shall not have much surplus. In some counties the reports are more favorable than in others. San Diego, for instance, but even there it differs, if near or further from the coast. Frost, cool rains, and cool weather (especially cool nights) have had much to do with poorer returns than last season, although the season was one month earthough the season was one more treatier than the season before. Wild flowers did not go to seed; the bloom was prematurely killed, and at one time neither pollen nor honey was gathered, and the queens stopped laying

Some honey is being gathered now, and the queens are laying again. Poland the queens are laying again. To len from fall flowers is coming in plentifully from the California poppy and doveweed. My bees are working on the azalia. Some melilot, that I allowed to go to seed last fall, and ap-peared above ground in the spring, on neared above ground in the spring, on implowed land or stubble, has en-tirely disappeared. I found a large bed of blue sage that showed the ef-fect of the frost; it had scarcely any seed in its pods, and most of that was white and had not ripened; although out in our winters. I find that the poplars are shedding their leaves, as well as the almonds. These are signs wen as the amonus. These are signs of early fall weather; in fact the weather has seemed more like fall than summer. We have had only a few very warm days. As soon as the sun gets down a great change in the atmosphere seems to take place, probably owing to the planets or the comet.

I increased 50 per cent. by natural swarming, though I kept it back as much as possible. All my colonies are in good condition, though at one time they had a very little honey. By using comb foundation most of them have filled out their bives besides rehave filled out their hives, besides replacing some old drone and irregular combs. I gave all partly-built combs, after trimming out the imperfect parts, to young laying quuens in 3-trame nuclei. I save the empty perfect comb by tiering up, using false ends to rest the frames on, as they are in the hive, over a 12-inch hox, with an iron pan set in it, and burn sulphur in the pan, occasionally, until have filled out their hives, besides rewith an non pan set mit, and wan sulphur in the pan, occasionally, until time to use them again. They must be kept dry or they will mold, and must be often examined. I do not think it worth while to save any but perfect comb, for by using foundation mandeterm middly half is the saving. combs are quickly built in the spring. I hive swarms on empty frames, except one frame of brood, and 2 outside empty combs or those partly filled with stores. After giving them foundation I have had the lower part built out ready for extracting in one week; in some cases by returning the bees and old queen.

It is hard work to rear early queens, as they have many enemies that catch the young queens; after May there seems to be less risk.

My bees seem to be all working cagerly, although honey is not coming in very fast, but just enough to encourage brood-rearing.

I will now describe the form of my hiving-box. When a swarm comes out, the queen's wing being clipped, she remains on the ground; I pick her np, cage her, and fasten the cage to the pole inside the hiving-box by a string or wire, holding the box in the middle of the swarm if in the air, or iust over the limb or bush where they are clustering, or if clustered, just over them. They will soon find out the queen and cluster on the box; if not, I drive them with a little smoke.

I have had half a dozen swarms secured in this way, with only one hox, almost as fast as they came out, and only a few on a limb. Give me a difference of  $\Gamma_2$  minutes, or 2, at most, and I will keep them from uniting. From 6 to 12 are necessary, according to the size of the apiary. When I have a queen that I do not care to save, I use this cage to keep her in. I have kept queens in eages for 2 weeks at a time. The bees will not let her starve. At one time I kept a queen on top of a hive for several days alone; I found a half pint of bees clustered I have had half a dozen swarms se-I found a half pint of bees clustered about her and feeding her. She was lively. I use wooden cages so that she cannot be chilled. I use a common starch box, the long way up and down; one side open, the other full of 1-inch holes, one false end,  $^{2}_{3}$  of the way down, for strength. The pole is  $1^{1}_{4}$  inches, and of a length to suit. I have used this for 2 years.

The BEE JOURNAL is steadily gain-ng ground and influence on this coast. Napa, Cal., July 11, 1881.

For the American Bee Journal,

### How to Build Wintering Houses.

F. W. COMINGS.

In the Journal for July 6, the edior asks some one who has a successful wintering house to describe it for the benefit of D. S. Kalley, Mansfield, Ind. I built such a one last year, and put 40 colonies into it on Nov. 18. On April 16 I took out as many, minus 2 that died of starvation; we also lost one other by starvation while on its

The house is 12x18 feet, and studding The house is 12x18 feet, and studding 10 feet. There being no cellar under it, we dug a trench about 2 feet deep, and laid a heavy stone wall in it. Our sills were 6x14 inches. We then set up a set of 2x5 inch studs, and double-boarded the outside and sided up the inside, filling the wall with sawdust. Then set up a set of 1x2 inch studs against this wall and sided up; then another set of 2x5 inch studs and stinds against this wan and saided up; then another set of 2x5 inch studs and sided with matched spruce, tilling the second wall with sawdust. Thus we have two 5-inch stuffed walls, and an inch dead-air space between them. Overhead we put 10 inches of sawdust, and stuffed the floor, using 4 inches for that. We use 3 doors in one end, for that. We use 3 doors in one end, in winter, making 2 dead air spaces. Have ample ventilations in roof and floor. I have thus given you the main points, which probably will be suffi-

### THOMAS C. NEWMAN.

EDITOR AND PROPRIETOR.

CHICAGO, ILL., JULY 27, 1881.

Several correspondents write with pencil, and we desire to ask them to write with ink hearafter. By eontinuous work, writing and studying, our eyes are getting quite weak, and it tries them very much to read long articles written with pencil. Eyesight is precious, and we wish to preserve it as long as possible.

We have received from the author, J. B. La Montagne, A. M., L.L. D. of Montreal, Canada, a copy of his new work, entitled: "Le Nouveau Manuel du Cultivateur ou Culture Raisonnee des Abeilles, de la Vigne, et de la Canne a Sucre." It is modern in its teachings, and though the engravings are not as nice as they should be, still we are glad to welcome this Manual for French bee-keepers. Price 75 cts.

E. P. Roe's Catalogue of Small Fruit and Grape Vines, for the summer and fall of 1881, is received. It is full of information on the production of small fruit. Mr. Roe's nursery is located at Cornwall-on-Hudson, New York.

We hear complaints from many bee-keepers, this season, regarding difficulty in rearing and testing queens. Some complain of the cool nights as being unfavorable for the nuclei, and others have much trouble in getting queens mated. Most breeders have found it impossible to fill all orders promptly, and have been obliged to ask the forbearance of customers.

The Inter-State Exposition will be held at Chicago, commencing Sept. 7, and closing Oct. 22, 1881. At the same time and place the Illinois State Horticultural Society will hold its annual fair, the premium list of which is on our desk. Prizes are offered ranging from \$2 to \$100 for the best exhibits of fruits, vegetables, etc.

By reference to announcement in another column, it will be seen that the National Convention will meet in of October, 1881. We regret that a time has been selected by the Executive Committee when we will be unable to attend, but an engagement made nearly a year ago will necessitate our absence. We would, however, urge all who can possibly attend, to do so, and make the meeting as interesting as possible.

The Kentucky State Convention will meet on Wednesday, Oct. 12, 1881, at Louisville, Ky., and holds 2 days. It is expected that many who attend the National Convention, at Lexington, will also attend the State, at Louisville. The prospects for an interesting Convention at Lexingtan are very flattering.

### Honey is Becoming a Staple.

The Bulletin of the Apicultural Society of Alsace and Lorraine, for July, 1881, edited by Mons. Dennler, of Enzheim, near Strassbourg, Germany, has an article upon "the importation of American honey at Hamburg during the year 1880." It says that "the Hamburg Journal has formulated a very interesting table on the quantities of American boney that have been imported in the past four years.' In astonishment it says: "Voice ce tableau!"—see the table!

The total amount of American honey received at Hamburg in 1877, was 1.018,000 kilos (a kilo is 2 pounds). In 1878 it was 1,529,500 kilos; and in 1880 it was swelled to the enormous amount of 1,912,500 kilos, or nearly four millions of pounds.

It will be seen that the amount imported last year is double the amount given for 1878.

When the National Convention of the North American Bee-Keeners' Society, in October, 1878, appointed the editor of the BEE JOURNAL to represent the Society at the Conventions and among the bee-keepers of the Old World, it elicited considerable criticism on the part of some near-sighted bee-keepers, who could see no market beyond their own limited home trade, and could recognize no right for others to engage in an enterprise which might by any possibility come in comnetition with themselves. But the Convention, with a wisdom for which it has not received proper credit from the bee-keepers of America, foresaw the advantages to be derived from the eultivation of closer relations with foreign bee-keepers.

In 1880, the Delegate visited most of the more prominent apiarian societies of Europe, and was received with cordiality and courtesy by all. But much prejudice was discovered to exist against American products, and especially was this the case regarding honey. In England the public had been frequently imposed upon and become disgusted with vile trash sold as "Pure Strained Honey;" while in France, Italy and Germany, it was incomprehensible how the Americans could produce such vast amounts of apparently superior honey, and compete with their own producers, after paying exorbitant freights.

The Delegate appreciated the immensity of the market awaiting our product, but realized the necessity for Lexington, Ky., on the 5th, 6th and 7th removing distrust, and wherever he went, labored with this object in view. It was not enough to assert that our honey was superior to theirs, but he was obliged to prove why it was; nor was it sufficient to claim that we could produce pure boney and meet the public demand at popular prices, but he found it best to demonstrate how it would be accomplished.

> However, a limited few in this country looked with disfavor upon the whole movement. We copy the following from the minutes of one of the Western Conventions:

Much discussion was had pro and conin regard to sending delegates to Europe to instruct their people to keep bees in a better way, thereby causing them to produce more honey to compete with our own honey. Some were

opposed to such a course, saying it would injure our foreign honey mar-kets; others favored it, claiming it would increase our sales, as the more was advertised the more it would be bought.

Another Convention had the following question for discussion:

"Is it advisable to send delegates to foreign countries to educate their people in the advanced methods of bee-keeping, to thus enable them to more readily compete with our own bee-products, and also follow the same course in this country.

Scarcely, however, had the delegate returned home, when our market became stronger. The foreign demand was strengthened, and a healthy competition was springing up. We give the following extract from a letter received from the principal honey dealer in England:

You might cover Europe with the most approved modern bee-keeping appliances, but you could not prolong our honey seasons. Bee-keeping here can never be pursued as a business, because our honey seasons are of no eonsequence; so all feurs of our com-petitition can be discarded as absurd and ridiculous. You here rendered me great assistance in abolishing the unfair prejudice existing about that me great assistance in abolishing the unfair prejudice existing about that time in the minds of English consumers against American honey; in fact, it was remarked by many that the whole of your valuable time was devoted to this most important desideratum. Time which almost all visitors to this country would by a spent in to this country would have spent in sight-seeing, you occupied in counteracting the many absurd stories about "stuffed honey combs" launched into this country from America. You deserve and will have great credit for your tireless efforts in that direction.

Now we have the gratifying intelligence, in German figures, that the sale of foreign honey in Germany has nearly doubled in the past four years, reaching an aggregate almost equivalent to one-eighth of the entire product of North America. But very few years can elapse before Europe will eagerly consume our whole surplus product, and seriously encroach upon the portion required for a liberal home consumption; and while the honey itself is rapidly becoming a staple production, and finding its way as such into the markets of the world. the price is as rapidly assuming a stability as is that of butter, cheese, lard ete. A couple of years since a familiar correspondent querulously wrote, in substance, "Bee-keeping will pay, as an occupation, when honey shall have become as staple as is beeswax, for the latter is as stable as gold. We believe we have about reached that time; and it only remains for the bee-keepers themselves to maintain it as such, by producing a superior article, and selling it only at a remunerative moderate price; by exercising at least an ordinary business judgment in providing sufficient pasture for the bees, so that one season may not be a plethora and the next prove a dearth, and by cultivating a generous, fraternal spirit, remembering that the same wise Creator who placed us here and imbued us with generous as well as selfish natures, also created the balance of mankind, and endowed them with equal reason and rights.

C. F. Muth and W. Williamson are appointed a committee on arrangements for the National Convention, and they will, in due time give railroad and hotel rates in the JOURNAL. mium List upon application.

### Encourage Progressive Apiculture.

Referring to the correspondence of Mr. J. S. Tadlock, and our comments thereupon, we have received the following communication from Pres. N. P. Allen, bearing date July 12, 1881:

I was pleased with the editorial remarks in the BEE JOURNAL of July 6. relating to the exhibition of bees, etc., at the National Convention, It was a good suggestion, and is better calculated to bring out the "coming bee" han anything that has been done in that direction. Let every bee-kee who possesses what he thinks to b Let every bee-keeper superior strain, send bees for exhibition—not full colonies, but a queen with workers enough to spare a few for comparison and examination. A committee can be appointed to compare size of bees, length of tongues, etc., and make decisions as to whom belongs the honor of having the "coming bee." We can undoubtedly have on exhibition fine specimens of Apis dorsata, Syrian, Cyprian and Italian bees; also, Apis Americana, Albinos, and the German or black bees can come in for their share of the honors. Hives, honey boxes and useful implements can be exhibited. No one is authorized to offer premiums for bees in the name of the Society, but the honor of having superior bees, with the longest tongues, will amply pay for all the trouble and expense of making the exhibit. After the committee all the trouble and expense of maxing the exhibit. After the committee makes its report, the bees and queens can be returned to the exhibitor, or donated to the Association. I shall write to the bee-keeping fraternity in Expense tataks part in the exhibition Europe to take part in the exhibition.

We are glad President Allen approves the suggestion. Not only can the National Association do much to encourage the development of the 'coming bee," but Local and District Societies can also assist greatly in advancing progressive apiculture. Progress is not confined alone to the coming bee, but to every part of the business that exercises a bearing upon ultimate success. In fact, the summit of progress will not have been reached until the problem has been solved of how to realize the greatest amount of profit and pleasure, from the smallest investment of capital and labor, with the least risk. Many factors will enter upon this solution, and we believe it should be a special feature of fraternal associations to determine upon and encourage the best.

The German Zeitung, of Milwaukee, Wis., makes the following notice of our pamphlet, a German copy of which was sent at the request of the editor of the Zeitung. It says:

"The Honey Bee" is the title of a valuable little work of 80 pages, intended for the beginner, and is pubtended for the beginner, and is published by Thomas G. Newman, Editor of the American Bee Journal, 974 W. Madison street, Chicago. It contains everything that is interesting to beginners; it leads off with a short natural history of the bee, and then describes the management of the same, and it also details all new inventions portaining to been keeping. wentions pertaining to bee-keeping. This book is embellished with 56 engravings, and costs but 40 cents. It may be had of the publisher, both in German and English.

We have received the Premium List of the Kansas State Fair Association, to be held at Topeka, Kan., Sep. 12 to 17, 1881. We notice that \$18 and 7 diplomas are offered for beefixtures and honey. Mr. George Y. Johnson, Topeka, Kan., is the Secretary, who will send a copy of the Pre-

### To European Bee-Keepers.

The following letter from President Allen, sufficiently explains itself:

Editor Bee Journal:-Allow me through your columns to extend the following traternal invitation to the bee-keepers of the Old World, with a request that all bec periodicals copy the same :

To the Bu-Keepirs of England, France, Germany, Italy, and elsewhere, greet-

The time is fast approaching when the North American Bee-Keepers' So-ciety will convene at Lexington, Ky. An exhibition of bees, queens, hives, honey boxes, implements, etc., will be one of the features during the session one of the features during the session of the Convention. We invite you to participate in the exhibit. No gold medals or money premiums are offered, but awards will be made by a committee. All exhibits you may send will be properly attended to. We cordially invite you to be present, and take part in the discussions. Essays man any tonic in heaceulture will be upon any topic in bee-culture will be highly appreciated.

Articles may be forwarded, charges prepaid, to Wm. Williamson, Lexingon, Ky., Vice President for Kentucky Hoping to meet many of our European

friends. I am fraternally yours,
N. P. ALLEN,
Pres. N. A. B. K. Society.
Smith's Grove, Ky., July 12, 1881.

In noticing the reception of the Indiana State Fair Premium List, we stated that we only found a premium of \$5 for comb honey, in 5-pound boxes. The Indiana Farmer calls attention to some other premiums, on page 27 of the pamphlet. We there find the following premiums, and gladly make a note of them: "Best 10 pounds of comb honey in packages of one pound or more, \$5-second \$2; best 10 pounds, or more, one-pound packages of extracted honey, \$5second \$2; best crate of honey in the comb, in the most marketable shape, \$6; best display of honey, both comb and extracted, \$5; best display of wax, \$2; best machine for extracting honey, diploma; best display of beekeepers' supplies, diploma.'

The Prairie Farmer also adds: "Our Honorable Board of Agriculture deemed it best to leave the bees out of the list until a greater interest was shown in this department. We are sure they are willing and anxious to do all in their power to assist any and all departments in which any interest is shown."

Getting Used to Glucose, -The Histern Rural remarks that " A writer in a certain paper says that apiarists must get used to seeing glucose honey in the market. They are used to it, but do not propose to stand it if they can help it." And the BEE JOURNAL would add that apiarists "can help it," and do not propose even to try to "get used to it!" It is a nefarious swindle to use the trash for the purposes of adulteration, and bee-keepers will fight it to the "bitter end."

Complimentary.—The New Sharon (Iowa) Star, makes mention of the BEE JOURNAL thus:

It is the standard authority in its particular line, and ought to be in the homes of every individual who is ennomes of every individual who is engaged in bee-culture. You have only to send \$2 to Thomas G. Newman, of Chicago, and you will receive one of the handsomest weeklies published in this country.

### MISCELLANEOUS.

Dividing for Increase.—Mr. Geo. M. Hawley, in the Nebraska Farmer, says:

All who have kept bees have seen swarms coming from the hives, rushing or tumbling out, or any way to get out, the queen coming after most of the bees have left the hive. After circling around for some time they alight on some tree, shrub or prominent object near the hive, waiting for their master to provide a shelter. After which, it it is acceptable, they go to work with a good will, in kind appreciation of his attention, and if nature is lavish in her stores of sweetness, they will abundantly pay him for services rendered. It he be negligent, however, and allows them to hang long in the cluster, uncared for, they "take matters into their own hands," and send out scouts in search of a them to hang long in the cluster, uncared for, they "take matters into their own hands," and send out sconts in search of a suitable abode, to which, when found, they go. This is nature's plan of increase. That "dividing" the colonies can be done by the careful and intelligent apiarist with equal if not better results than nature performs it, there is no doubt; but that as good results are not obtained by the majority, sneaks rather against the aniar-

that as good results are not obtained by the majority, speaks rather against the apiarists than the system. If we observe closely we will see that bees make preparations for swarming only when they are gathering honey, and the hive is crowded with bees. They start the queen from the egg, not taking larvae of several days' growth around which to form their queen cell, as is usually the case when accidentally or intentionally deprived of their queen. Therefore, the queen is fully developed, being reared while they were gathering honey. The queen was made much larger, and the larvae much better supplied with food than if reared at other times.

Having seen the demands of nature we can now imitate her and by careful selection in the colonies from which to rear our

can now initate her and by cureful selection in the colonies from which to rear our queen, can make improvement much faster than if they were left unaided. If we deprive a colony of their queen, and they have brood in their hive, they will form from 5 to 20 or more queen cells of larva, and by a greater amount of food develop those that would have hatched worker bees into queens. In other words, a worker is an undeveloped female, by growing her in a queen cell, and furnishing her with more food she will be fully developed.

We have already seen that queens are raised naturally, during a flow of honey. If, then, we wish to rear them at any other time, the colony should be fed. Also to secure her fullest development, she should be started from an egg and not after the egg has hatched. Therefore, all brood should be taken away, and combs of newlaid eggs put in their place. Queens are so hostile to one another, that as soon as one hatches, if not taken away, she will destroy all the others. If it is desired to save the queen cells, nucleus colonies of one or more combs of brood and hees, taken from strong colonies, should be put in hives constructed with a division board; on the ninth day, all the queen cells but one should be cut ont, putting a cell in each of the nuclei. After the queenshave hatched and commence to lay, the nucleus colony can be built up by giving it frames of brood from the stronger colonies, putting empty frames, or trames with comb of brood from the stronger colonies, put-ting empty frames, or trames with comb foundation, in their places.

Work for August.-In the American Agriculturist Mr. L. C. Root says:

During the month of August take care not to add too many boxes, or to extract too freely, in localities where fall forage is scarce. I would advise every bee-keeper to leave a few hives without extracting all of the combs. In fact, where boxing is practical, it is well to arrange a few hives with extra

combs to be filled and capped over.

I have frequently known seasons in which the brood combs were so en-tirely filled with brood that all the honey was stored in boxes; then the yield of honey closing abruptly, but little or no honey was stored for winter. At such times it is most desirable to have heavy cards of sealed honey that may be furnished to such colonies. In a word, we should not be so eager to secure a great surplus as to run the risk of starving our bees, which is sure to be the result of improper management.

The Danger of Procrastination. Mrs. L. Harrison gives the following good advice on this subject in the Prairie Farmer:

The late Prince Napoleon lost his life by his habit of procrastination. It had always been his habit from ear liest childhood to plead for a delay of 10 minutes, when requested to per-form some duty, such as retiring to bed or arising in the morning, and it became fixed—as it were a part of his When his command desired to being. When his command desired to return to camp, his characteristic reply was: "No, let's wait 10 minutes;" and at the expiration of this time the Zulus came. Do every duty as soon as it can be done, is the only road that leads to success in temporal and moral affairs.

few days ago, while visiting at a farm house, we noticed a colony of hees, that were clustering on the out-side of the hive for want of room inside, and on our remarking to their owner, that he should give them more space, by putting on surplus boxes, his reply was: "1'm going to do so as soon as I get my corn planted." As he had but one colony, it would not have taken him much more time to have laid back the duck, and put on a box, than to have said so. Those persons who wait to plant, and work their corn, sow buckwheat, etc., before supplying their bees with surplus boxes, will find in the fall that they have no honey for their cakes. The proper date for supplying boxes varies with the climate, strength of colonies. and yield of honey. Inexperienced persons are apt to put on boxes too soon, and too many at a time. If too much space is given it cools the hive too much, and bees cannot manipulate their wax. A person, to be a suc-cessful apiarist, should become famil-iar with the habits of these industrious insects, and then use his judg-ment in their management. A farmer told us recently that during fruit bloom his bees built comb in the porduring fruit ticos of their hives, and he thought that they would swarm sooner if did not put on boxes. In this locality bees sometimes store in boxes during fruit bloom, but it is rare, but if they have been well managed, they are ready to go to work in them at the commencement of white clover bloom. are should be exercised to secure all the white honey attainable, and in the best marketable shape.

Bee-Keeping in the South.—Mr. A. F. Moon, Rome, Ga., reports as follows in Our Home and Science Gossip:

Some apiaries have, with little care, yielded 100 pounds to the colony on an average, the present season, and where there has been care, little swarming has resulted. There is no cold weather here, and the bees fly almost every day during the winter, but where this freedom is allowed them they consume honey than when properly L. They are, however, more housed. healthy and vigorous when privileged to fly, than when confined to their domiciles.

Bees Hanging Outside the Hive .-The *Home Farmer* remarks as follows on this subject:

The next care that comes after swarming is the honey harvest. In view of this it is always advisable to view of this it is always advisable to give additional room at the top of the hive, and sometimes even below the hive when the season happens to be exceedingly good. The bees will often fill a cap (or super) of beautiful honeycomb before they swarm. Therefore he on the below at and when the fore be on the look-out, and when the season is good, the weather line, and the bees show signs of want of room by hanging ever so little outside of by hanging ever so little outside of the hive entrance, lose no time. Open the hole at the top and let them into the super. You must cover this well over, so as both to keep in the warmth and to protect them from a too hot sum as from wet. If their numbers still increase, and they hang out

agam before swarming, they must have yet more room given to them; for hees should never be allowed to remain idle; many pounds of honey are often lost to the bee-keeper in this

Beautiful Honey.—The Grange Bulletin, of Cincinnati, O., very truthfully remarks as follows:

Extracted honey is certainly the extracted noney is certainly the perfection of the product, though honey in the comb as yet brings the higher price. People say because it is more beautiful to the eye, but this cannot be true. Served in a stand of crystal, extracted or clear honey, golden in color and as transparent as the den in color and as transparent as the crystal itself, what object is more beautiful upon a well-appointed tea-

The time selected by the Executive Committee for holding the National Convention, at Lexington, Ky., is October 5, 6, and 7, 1881. All beekeepers are invited to attend and take part in the deliberations of the Convention. As Lexington is a central point, the Executive Committee hope to have a large attendance from the the North, South, East and West, and from Canada, and that the 12th annual meeting of the North American Bee-Keepers' Society will be the most in-teresting meeting that the bee-keepers the United States have ever held.

The National Convention will be held during the time of holding the St. Louis Fair and the Expositions at Cincinnati and Louisville, and that all passing through those cities can get the benefit of excursion rates.

N. P. Allen, Pres.

The Northwestern Bec-Keepers Association will meet in Chicago, on Tuesday and Wednesday, October 25 and 26. All bee-keepers are cordially invited to attend. It is desired to make this one of the most interesting conventions ever held in the United States. C. C. MILLER, M. D., Pres. States. C. C. MILLER, M. I C. C. COFFINBERRY, Sec.

The Northwestern Illinois and The Northwestern Hillions and Sonthwestern Wisconsin Bee-Keepers' Association will hold its next meeting Aug. 30, at Rock City, Stephenson Co., Hl. Jonathan Stewart, Scc.

The Northern Michigan Bee-Keepers' Association will hold its fourth Annual Convention at Maple Rapids, Clinton Co., Mich., Oct. 11 and 12, 1881. O.R. GOODNO, Sec.

The Southwestern Wisconsin Bee-Keepers' Association will hold its next meeting in Platteville, Grant Co., Wis., Nov. 30, 1881. N. E. France, Sec., Platteville, Wis.

Bees Doing Well.—Bees here are do-Book Dong Well.—Bees here are do-ing well, gathering honey steadily from swamp woodbine and button willow. We shall have bitter-weed during August, and after that a va-

riety of fall flowers.

OSCAR F. BLEDSOE.

Grenada, Miss., July 18, 1881.

The Honey Harvest.—The summer yield will be but \(^1\_4\) crop, at most; basswood is a total failure, and white clover not much better. Bees are plenty in the hives, hang idly about, with no honey to gather. I do not expect much of a fall harvest, and that will be of a segund amplity. There will be of a second quality. There will be no surplus to speak of in this immediate vicinity, though bees will be in good condition for winter.

C. B. WOODMAN.

Johnson's Creek. Wis., July 17, 1881.

Regained the Loss of Last Winter.—My bees are doing well. I have filled all my hives again, and they are now in good condition for another year. I like the Weekly BEE JOURNAL much, but I am glad you are to change the size of the wear part year. But me down for a life subscriber. I live 10 miles from Louisville, the only place I can get a letter registered, and sometimes I do not go to that city for 3 or 4 weeks, but I will pay up regularly, and all the time, so do not stop sending it at all.

WILLIAM BENCE. ing it at all. WILLIAM BE Newburg, Ky., July 15, 1881.

[With pleasure we have marked your Journal to come "without ceasing." All we want to know is that it is desired. We prefer to send it thus, and hope all who desire its continuous visits will notify us, and thus save us, as well as themselves. much trouble and annoyance.—ED.]

Good Square Work.—I never saw bees work as they are doing this sum-mer. Most of the bee-keepers of Kane county lost their bees last winter. The entire loss amounted to 1,500 colonies, at least. There never was such destruction known here before. I had enough bees left for seed. GEO, THOMPSON.

Geneva, Ill., July 15, 1881.

Ventilating a Cellar.—My bees are doing well. I had only 2 colonies alive in the spring; they increased to 8 and gave me considerable surplus honey. I made a room in the cellar for wintering bees, immediately under a coal stove, where the atmosphere will be regularly at about 45. I have a 2-inch tin pipe to bring in air, facing the west, running 20 feet through the cellar before entering the bee room. On the east I have a pipe 4 inches to conduct the air out through a window. Will a 2-inch pipe give enough fresh air? The room is 10 feet square, by 7 air? The room is to rect square, by a feet high, and kept from the stone wall on all sides; the floor is also raised from the ground.

D. LANTZ.

Forreston, Ill., July 19, 1881.

[A 2-inch pipe should give sufficient ventilation. It is 12 an inch more than used by several who ventilate in a similar manner.—Ed.1

Bees Doing Nothing Now. — Bees have been doing nothing for about 3 have been doing nothing for about 3' weeks. Previous to that they did well, as far as swarming is concerned; they have killed off the drones already. What the fall harvest will be, I know not. Basswood was in bloom but a few days. About \(^{1}\_{3}\) of of the bees winter-killed. The weather is very hot.

Peter Billing.

Pawnee City, Neb., July 16, 1881.

latitude have done well this season. Last year I had 33 colonies, and in the Last year I had 53 colonies, and in the spring 15 died from starvation; I now have 34; from one I obtained 40 lbs. of honey and 2 large swarms. I have but one colony of black bees, and it gave a swarm of as line Italians as I have. How came that to be the case? All the bees have three yellow bands, and are as fine as those from my imand are as the as those from my imported queen. I can only account for it in this way: I had some young queens about ready to take their bridal trips, and one of them was missand crips, and one of them was missing; it may have gone to the swarm while they were settling. I had a swarm come out which I hived, but the queen would not stay in the hive, so I clipped her wing, and in the evening they came out again. I looked in the yard and found the queen with the clipped wing dead. I hived them again, and found another queen. They remained all right, and are doing well. remained all right, and are doing wen. This may not be new to old bee men, but I never had a like case before. I have one colony, the bees of which during the late extremely hot weather. would come out and fall from the bench, and have the ground covered with bees that could not fly. The col-ony has a large quantity of honey. What was the cause of their falling to the ground? How late would it be the ground? How late would hose safe to extract in this country? I have just received my extractor, but am fearful it is too late to extract much. I read the BEE JOURNAL with pleasure, and would not be without it for double its cost.

II. M. WILLIAMS, M. D.

Overies from Georgia.—Bees in this

Bowdon, Ga.

[You have undoubtedly solved the problem regarding the metamorphosis of your black bees into Italians. It is not unusual for two swarms to emerge simultaneously, and, of course, one of the queens would have to desert the new hive, or perish in combat. In the case of the bees coming out of the hive and dving on the ground, it would be difficult to state definitely the cause without a critical examination of the interior of the hive; but we presume the heat softened the brood combs so that the cells were more or less disforted by the constant passing to and fro of the worker bees upon their surface, and as a consequence the young bees were deformed, and sought to die in exile. So long as there is a continued prospect of honey, it will do to extract. In your latitude, too close extracting is not necessarily fatal, as it might be here, for the Georgia winters are never so severe and protracted that there is not ample opportunity for feeding. It is, however, quite as necessary that bees in the South should have plenty of stores provided for them as in the extreme North, for often more or less breeding is going on through the winter, which consumes honey rapidly. It is not an uncommon occurrence, in the South, for bees to breed up, consume their stores, and starve before the spring honey flow sets in.—ED.1

Size of the Langstroth Hive. - DEAR EDITOR: Did you not make a mistake in giving the size of the Langstroth hive in the BEE JOURNAL for July 6 page 213? I ordered a Langstrott page 213? I ordered a Langstroth hive, and received one  $18^3_8$ x $14^1_8$ x $9^7_8$ . Frame, when adjusted in the hive, was  $^3s$  from the top and  $^7s$  at each end. I am aware that there are hives made am aware that there are hives made which are claimed to be Langstroth hives, and nearly every one makes them of a little different size. I wish hive manufacturers would be more

this morning for the box-hive men. It was from one of our "street-corner-hard-working-men," who has been foremost in all undertakings through life, but from appearance has met with misfortune, or he must have been a Stewart or Rothschild. Said he: "I have handled bees for over 50 years; I know all about them. The great trouble is, you do not give them room enough to build their combs; you want at least 1% inches for each frame—2 inches is better. Then, this transferring is all wrong; let them have their own way about building their combs. Why," said he, "I once lived down on the river bottom and had one stand of bees; they swarmed 14 times one sea. life, but from appearance has met with bees; they swarmed 14 times one season; when the last swarm came out of that hive I had nothing to put them in that have I had nothing to put them in but a flour barrel, and so I put them in that, quite late in August. They filled that barrel full of solid white comb honey, and not a particle of brood or bee-bread in the barrel; nothing but clear honey. We sold \$26 worth or bee-bread in the but clear honey. We sold \$26 worm of honey from that barrel, and had lots left—over 300 lbs." If this is all true, I think that we had better go back to boxes and barrels.

Urbana, Ill. S. GOODRICH.

fThere was a typographical error in the dimensions of the Langstroth hive. as published in the BEE JOURNAL for July 6; it should have read 9% instead of 1078 inches in depth. The hive you purchased is correct. It would be a very important movement, if beekeepers could determine which is the best hive, and rigidly and scrupulously adhere to the same dimensions; then one of the serious drawbacks to the fourth page of the JOURNAL for a free interchange of hives, frames last week we gave statistics on last and bees will have been overcome.

Foul Brood, Honey Crop, etc.-Foul brood may be carried in foundation made of wax taken from foul-broody hives. A friend of mine, in this valhives. A friend of mine, in this valley, with about 60 colonies, found so many of them with foul brood early in the spring, that he transferred them into new hives and boiled the old ones. He made new frames, taking a great deal of pains not to let the bees get any of the honey, but made up the wax into foundation, and after they got well filled with brood he found it worse than at first in every colony. He is satisfied that it was carried in the wax. I commenced in the spring with 75 colonies; kept them well snugged up, examining them as often as once a week, and took the old honey away from all that were honey-bound, to give the queens a the old honey away from an that were honey-bound, to give the queens a chance, as they were bringing in more than needed, which is unusual here in February and March. By attending closely to them they gave me, in March and April, 45 pounds of wax, and 3 170 pounds of extracted honey. March and April, 45 pounds of wax, and 3,170 pounds of extracted honey. I increased to 96, with honey enough to last them through. I doubt there being any more honey in this State than we need.

S. BUTLER, M. D.

Los Gatos Cal., July 14, 1881

Los Gatos, Cal., July 14, 1881.

[There is not a possibility of foul brood being contracted by using foundation made from foul-broody combs. It is sheer nonsense, to say the least, to suppose that the infection was eradicated when your friend "boiled the old hives," yet would linger in the foundation after the several boiling processes necessary to transform the comb into a perfect sheet.—Ep.]

Not Mated. - I herewith send you a Not Mated.—I herewith send you a young unfertilized queen. I take her to be about half-way between a worker bee and a queen—not sufficiently developed to mate with a drone. I have been watching her for three weeks; she seems to have no inclination. The leave the hive to meat a drone. She careful about sizes, and not guess at it she seems to have no inclination to so much; it would be much better for all of us, should we have occasion to exchange hives with our neighbors. I received rather a tlattering report should be much better for leave the hive to meet a drone. She worker, locates eggs all through the live; yet she is easily distinguished

from the worker bees. I think she might be called a fertile worker: what do you think of her?

JAMES T. FIFE.

Corning, Iowa, July 17, 1881.

[We think that, excepting her diminutive size, she is a perfect queen. Either unpropitious weather, absence of drones, or other circumstances prevented her mating at the proper time, after which she became what is called a drone-layer, and lost all desire to leave the hive.—ED.]

llow to Winter Bees.—I lost 24 colonies of bees last winter and spring, by dysentery. They were in an underground house, well ventilated, as I thought, but they became damp, and I could not prevent it. Wintering apparent to be the great problem, the sothought, but they became damp, and I could not prevent it. Wintering appears to be the great problem, the solution of which is necessary to success in apiculture, and I greatly desire to have the views of the editor of the BEE JOURNAL on the subject. Which BEE JOURNAL on the subject. Which is better, a winter depository above or below the ground? Will it do for the hives to be placed in rows, with a shed built over them and on one side, leaving entrances open, as recommended by some? Different localities require by some? Inherent localities require varied kinds of preparation, and there are so many things to be considered that I find myself in a quandary. As with all other avocations, with all the teachings and experiences of others, nothing is so sure of success as good brains well used. G. B. OLNEY.

Atlantic, Iowa.

[Our views have been given several times of late, on wintering, and on winter's losses, and "our views" upon them. Next week we shall give a long article from Mr. Ch. Dadant, on the same subject-all of these we commend to the careful study of our correspondent, as an answer to his queries.-Ep.]

The Honey Season in Texas. spring honey season being over, I now send you my report to June 20. I wintered without any loss, including wintered without any loss, including several 2-frame nuclei. I commenced in the spring with 7 colonies; up to June 20 1 took 968 pounds of surplus honey and increased to 20 good colonies. Continued dry weather cut the honey season fully 2 weeks short. I think our fall honey will compare favorably with any in the world, both in appearance and delicacy of flavormost of our spring honey being nearly most of our spring honey being nearly white. Bees are now gathering honey dew from oak and elm, to a limited extent, but the quality is very poor, and the color is dark. I am glad to see it coming in, anyhow, for it keeps up brood-rearing, and makes it favorable for rearing queens.

Jas. G. Taylor.

Austin, Tex., July 11, 1881.

Brushing off the Bees. — I commenced this season with 22 colonies and have increased to 75, mostly by natural swarming. I extracted 600 natural swarming. I extracted 600 pounds of white clover honey, and have 25 colonies working in the secondary to the contract of the contract tion-boxes. Basswood is just commencing to bloom. Is there any danger of losing queens, when brushing off the bees in front of the bive, if she should happen to be in the second struckly and the should happen to be in the second struckly and the second s ond story when extracting, or should I look for her? EMIL PETERMAN. Oostburg, Wis., July 12, 1881.

[You should look at every comb taken out, whether you want the queen or not. She is frequently in the second story.—ED.]

Heavy Crop of Honey.—Bees are now doing their "level best" on gathering honey. Another week or two like the past one will secure for us a heavy crop of honey.

GREINER BROTHERS.
Naples, N. Y., July 20, 1881.

THE PILGRIMS PROGRESS

From this world to that which is to come. This remarkable book, as every one knows, was written under the similitude of a dream, by John Bunyan, the most popular religious writer in the Eoglish language; and perhaps more copies have been sold than any other book except the Bible. Our edition is complete and unabridged, with appropriate illustrations.

Our edition is complete and unanringed, with appropriate illustrations.

GULLIVER'S TRAVEUS.

This book tells of the supposed travels and surprising adventures of Lemuel Gulliver into several remote regions of the world, where he met with a race of people no larger than your hand. Also his wonderful exploits among giants. Complete in one volume. Finely illustrated.

THE ARABIAN NIGHTS' ENTERTAINMENTS.

HE ARABIAN NIGHTS' ENTERTAINMENTS. Illustrated with numerous wood engravings, descriptive of those many strange and singular stories which the legend says the Sultaness of Persia related to the Sultan inght after night, in order to prolong her fife, and thus finally won his affections and delivered the many virgins, who but for her would have been sacrificed to his unjust resentment.

SAVED AT LAST FROM AMONG THE MORMONS. Every man and woman in the land should read this story which is founded upon facts, and gives an insight into the low estate of woman under the Mormon rule.

BREAD AND CHEESE AND KISSES

BREAD AND CHEESE AND KISSES.

By B. L. Farleon. A very popular Christmas story after the style of Dickers; abounds in excellent and novel features; is chiefly remarkable for its admirable picture of country life, giving the instery of a very happy and contented young couple who thought no tot in life too lowly for the pure cojoyment of Bread and Cheese and Kisses. Complete in one volume, with illustrations.

Orders taken now, and books mailed as soon as published. One will be issued every two weeks.

LIFE and ADVENTURES of ROBINSON CRUSOE.

This well-known book may be runked as the most popular standard juvenile book ever printed. Our edition is complete, and contains the wonderful adventures of a cast-awny upon a desert island. Complete in one vol. Fully illustrated.

THE PILGRIMS PROGRESS

From this world to that which is to come. This remarkable book, as every one knows, was written under the similitude of a dream, by John who similitude of a dream, by John who similitude. The process of the sumbor's carnest endeavor. The humor and homely wisdom of this book should carry it into every household. Complete in one volume—containing a great number of pictures.

containing a great number of pictures.

NEW FARM AND FIRESIDE COOK BOOK.

It tells how to cook all kinds of bread, cakes and meats; it tells how to make all kinds of soup; it gives reclees for cooking fish, oysters, punitry and game; it tells how to select the best poultry, fish, meats, etc.; it gives the best methods of preparing sauces and salads and all kinds of vegetables for the table; and tells the honsekeeper all she needs to know about hread, biscuits, rolls, puddings, pies, custards, creams, cookies, tea, coftee, chocolate, home-made candies, antidote for poison, cooking for the sick, and many other useful things.

other useful things.

#SOP'S FABLES.
The rantes of Æsopus, an apt representative of the great social and intellectual movement of the are which he adorned. Born a slave, he toreed has way by his mother-wit into the courts of princes. He knew that to be tolerated in courts he must speak to please, and he gave lessons both to prince and people by recitals of fables, which were very popular in Athens during the most brilliant period of its literary history; and he who had not Æsop's Fables at his finger's ends was looked upon as an illiterate dunce by Athenian gentleuch. In one vol. Very profusely illustrated.

NOBLE DEEDS OF MEN AND WOMEN.

A history and description of noble deeds, presenting correct and heautiful models of noble hie to awaken the impulse to imitate what we admire. By the recorded actions of the great and good we regulate our own course, and steer, star-guided, over life's trackless ocean.

The usual price of these books bound in cloth is \$1.00 to \$3.00 each. We propose to bind them in heavy paper or thin card board, and send them by mail and prepay the postage, for 25 cents each. They comprise a wide range and striking diversity of the most brilliant and pleasing productions of the most noted and popular authors, and include hooks of travels, adventures, liction and humor, so that all tastes will be suited. We propose to call it the FARM AND FIRESIDE LIBRARY, and any one obtaining these ten broks will possess a library of ten of the most popular books ever published. We have not room to give a full description of each book, but all will be delighted who obtain these noted books at so low a price.

THE BOOKS will be the latest and most complete editions, and will contain many illustrations, one alone requiring thirty-nine pictures to complete it.

THE PAGES are about 5½ by 8 inches—the most convenient size for reading and preservation.

THE TYPE is Minion, easy on the eyes. THE PAPER is heavy and of a beautiful white color.

THE TYPE IS MIDIOD, easy on the eyes. THE PAPER is heavy and of a beautiful while color. THE FIRST BOOK, Robinson Crusoe, was ready about April 1st. One of the others will follow every two weeks and be mailed to subscribers as sooo as published.

RELIABLE.—Messrs. Rowell & Co., publishers of the American Newspaper Directory, writing of the publishers of Fakm and Fireside, say, "they are accredited by the Mercantile Agencies with a capital of a Million dollars, and are too well known and too much respected to make it worth while to make any statements which are not true." Therefore all are sure to get the above books if careful to direct letters correctly.

### FLAT-BOTTOM COMB FOUNDATION,

These kegs answer the popular demand for honey in small packages, and when compared with large barrels holding from 300 to 500 lbs. each, they are fully as cheap and often cheaper. They need no waxing but should simply be thoroughly scalded with boiling water before using. The leakage so often occurring in the large hard-wood barrels can be entirely prevented by using the White Pine Kegs. Considering the cost and trouble of waxing, the loss of honey by leakage, and the ease with which these kegs can be handled and shipped, with an actual saving in original cost, it must be apparent to all that they are the best. ### An Assistant for the Apiary.

Knowing that our readers desire to be informed of all the "new things" intended for the apiary, we give on this page an engraving of "Davis' Honey Carriage, Revolving Comb Hanger and Recording Desk, Combined." The engraving is very plain, but in order to give the many uses for which it is intended, we have requested Mr. Davis to describe them, which he has done, as follows:

This invention is the outgrowth of years of hard labor in the apiary, and is gotten up entirely from practical

- It consists of a honey-safe, supplied with corrugated adjustable honey frame supports, so arranged as to hold the combs perpendicularly, and prevents them from coming in confact with each other, and thereby being
- 2. Forward from the honey-safe, over and on each side of the wheel, is a tool-box, large enough to carry all the tools, fuel for smoker, queen ca-ges, clamps, etc., required while work-ing in the apiary.
- 3. The top of this tool-box is shingled, so that when turned forward over the wheel, it rests on an adjustable support, and forms a strong and convenient writing-desk.
- 4. Hinged on the forward right hand corner, is a wash basin, convenient for cleansing the hands and tools of honey, etc., while in the aniang

5. A revolving comb-hanger is suspended by a thumb screw and swivel from the end of a lever, which can be drawn from the right side of the honey-safe, and a frame of comb suspended and revolved for inspection. If found to need pruning, or if queen cells are to be cut, the revolving bar can be firmly secured in any position by turning the thumb screw; and a second lever drawn from the honey-safe, directly under the first one, and below the bottom of honey frame; through the end of this an adjustable rod passes, with a revolving stirrup on the upper end, which straddles the bottom bar of the comb-frame, which is held as firmly as if held by both ends by an assistant, and the operator can proceed to prune or cut out queen A revolving comb-hanger is suscan proceed to prune or cut out queen cells, having free use of both hands. When not in use, these levers can be pushed back into the body of the safe, and are entirely out of the way.

The honey safe is furnished with a metal-dripping drawer to catch the honey that may leak from the combs; this slides out on the handles: be-

For the American Bee Journal, How I Wintered My Bees.

WM. BOLLING.

It now seems that the cellar carries the premium on wintering, being most successful, but all bee-keepers cannot have a good cellar or a good bee-house; I have not, and so I have to do the best I can on the summer stands, and that is, by my experience, a good chaff hive. I know of none better than the Quinby, with the tight-end frame. It also makes a great difference as to the manner of using the chaff; if packed too tightit will not permit the moisture to pass off sufficiently, and if too loose, it will not retain warmth enough. It now seems that the cellar carries enough.

I began packing bees last October, in the following manner: I removed the division-boards on each side of the brood-nest, and in their places I put a frame, made of lath, ½ inch higher than the combs; in these frames I tack old carpet (ingrain carpet is the best), then I take the division-board

mac. I call this box a storm-house. This storm-house is of great advantage to the bee-keeper; the entrance will not get filled with dead bees, as the bees will carry the most of the dead ones in this store house. It keeps the mice out, nor will the entrance become closed with ice and snow, and the bottom-board will keep perfectly dry. By this way of packing 1 have lost but 3 out of 37 colonies by actual death; 2 of them in box hives, and one in the American; 2 queenless colonies and 2 weak, old queens being the cause. My bees have no hill or wood protection; they stand upon the very bank of the big Canadaway Creek, and had to take the full force of every blizzard that came across lake Erie. I am the only one in this section of the country who has wintered bees with success on the mac. I call this box a storm-house, has wintered bees with success on the summer stands.

To my close attention to bee-keeping, and study of the BEE JOURNAL, L attribute my success in wintering bees. I not only read the JOURNAL, but I study it. I thank you very much that you will enlarge the JOURNAL for the next year, and give it a more convenient shape. Dunkirk, N. Y., June 21, 1881.

For the American Bee Journal

### How to Rear the Best Bees.

S. S. BUTLER, M. D.

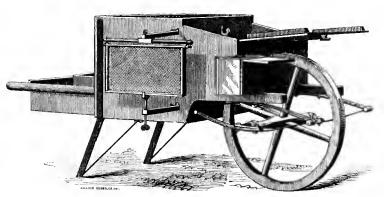

The great question is how to rear the great question is now to rear bees that will winter almost any where and almost in any way—bees that will ever be a satisfaction, in-stead of a disapointment. In the first stead of a disapointment. In the first place I want them of the yellow race, as they are decidedly superior, and from some locality where there had never been any forced queens raised, and after getting such stock thor-oughly tested in regard to their work-ing audities.

ing qualities.

My favorite way is to let them take My favorite way is to let them take their own course in the spring (keeping them well sungged up), and rear my queens and drones from those that build up first, as they will certainly prove superior in every respect. My experience has been that those that work best in the fall prove to be best in the spring. After making up my mind which I desire to breed from, I contract their hives, giving them, every few days, brood just hatching out, taking eggs and harva from them, and thus getting the hives quickly filled with bees so as to have them swarm out, and have the cells ready by the time the strongest of those I am not rearing queens from are getam not rearing queens from are getting ready to swarm.

ting ready to swarm.

After they are ouf, the best way is Mr. Doolittle's plan of finding the clipped queen, and putting her in an empty hive on the old stand, moving the old hive but a short distance, so that they may be united again, if desired. Then select the queen cells after the colony is quietly settled on the old stand, open the old hive, and I usually find from 5 to 8 cells, either sealed or the larvae nearly grown, which shows that they are about ready to be sealed. Mark all such, and also to be sealed. Mark all such, and also

Honey Carriage designed by John M. Davis, Spring Hill, Tenn.

neath this is a 20x24 inch metal-lined and put it on the carpet-frame in such drawer, 4 inches deep, which slides out and is suspended by the handles, forming a convenient place in which to put broken combs and fragments of

The top of the honey-safe stands about as high as an ordinary Langs-troth hive, and requires no stooping about as figures an ordinary Langstroth live, and requires no stooping to transfer honey from a hive to the carriage. By placing a strong board in the bottom of the dripping-pan, crates and boxes of honey can be wheeled from the apiary to the honeyroom, without fear of damaging the

The most convenient cover is cloth. with a roller at each side, and is rolled back, the same as the enameled-cloth honey-board, when bees are trouble-some; during a good yield of honey, when the bees are not disposed to rob, it is useless to use the cover. The en-graving represents the drawers partially drawn out: a frame of comb in the revolving hanger and the tool-box and wash basin open.

and put it on the carpet-frame in such a way as to leave a ½-inch air-space between the two; then I put 5 or 6 pieces of lath across the brood-nest (from which I have taken the honey-board), resting with each end upon the end of the carpet-frame; over these pieces of lath I put a piece of ingrain carpet, and then have a space of one inch all over the brood-nest. I find the bees in the spring dry and warm, and holes made through the combs for winter passages are unnecessary. and holes made through the combs for winter passages are unnecessary. Then I fill the remainder of the hive, 6 inches on each side and 6 inches on the top, with chaff of any kind. I have now a space left of 6 inches to the peak of the cap, which remains empty. A one-inch auger hole in each gable end gives sufficient ventilation of air. These auger holes are opened or closed, according to the weather. or closed, according to the weather.

When winter commences in earnest on the entrance, which is 3% by 5 inch, its whole length, and put a little box, that fits close over the entrance, with a tube 10 inches long made of su-

the number of them on the outside of the hive. If you want to raise a great many queens, divide one of your larg-est colonies, and after 2 days put the est colonies, and arrer 2 days put the sealed cells in the queenless part, de-stroying the ones they have made, then put the best queen and bees to-gether again, and crowd her with bees, and in advert time they will propose gether again, and crowd her with bees, and in a short time they will swarm out again. By working in that way you can rear a quantity of superior queens from the best ones; make nuclei 2 days before putting in the choice cells, and you will not have them torn down as they often are after 24 hours.

down as they often are after 24 hours. I have never lost one yet.

Those who want to rear the best queens should remember this: Never, under any circumstances, keep any cells but those I have described. You may ask: Why not keep all of them? Because some of the queens reared after they have swarmed will be started. ter they have swarmed will be started on larvæ, and they will start more cells than they can take thorough care of, as they do of those made before swarming. I have repeatedly tried both, and the cells made after swarming were not as fine as those reared before, and the queens did not give as vigorous and industrious workers.

They are not the best queens.

We may just as well have all vigorous, strong, healthy colonies that will bring in good returns. As it is, many keep nearly double the amount they need, because so many are poor ones, bringing in nothing. The main rea-son why there are so many poor coloson why there are so many poor colonies is, I doubt not, the large amount of imperfect workers that the bees worry to death, as they do the drones at the same time, amounting, in some colonies, to fully \(^1\_2\) of the workers. You will not find such where your best queens are. If you find a colony that is superseding their queen, give them a good cell in the place of theirs, or if out of season, and you want to save the colony, mark it and give them a good queen in the spring. Do the same by any colony, which from any cause rears a forced queen. It is impossible to rear queens, all of which impossible to rear queens, all of which will give us workers that are equally will give us workers that are equally vigorous and long-lived. Some queens excel others in this respect. Of a frame of bees all hatched the same day, a few of them will live for days

day, a few of them will live for days longer than the great mass, showing that some of the eggs are more highly vitalized than others.

In rearing a quantity of queens, we will find a few whose workers will show a marked superiority over all the others. Such queens are no doubt from those more-vitalized eggs. By taking all these presentions it is now taking all these presentions it is now. taking all these precautions, it is possible for us to rear queens and drones from the best ones, and we are improving our stock instead of having to keep it up by fresh importations. In this way we may soon have bees superior to any imported ones.

Los Gatos, Cal., July 5th, 1881.

From the Farmer's Home Journal. Good Advice for Beginners.

G. W. DEMAREE,

"What advice would you give a beginner in bee culture?" I propose to devote this short article to the answering of this question. It can readily be seen that in order to make the answer satisfactory to all who may be interested in the culture of the honey bee. would be necessary for me to be in-formed of the intentions and purposes formed of the intentions and purposes of the beginners, so that I might be able to make a proper application of such advice as I am able to offer. Some of us keep bees solely for the profits to be derived from the business; others simply for the purpose of supplying their tables with the most delicious of sweets; while there are another class who keen hees minicipally other class who keep bees principally to gratify their love for the study of their marvelous habits and natural history. To the charge of belonging history. To the charge of belonging to latter class I plead guilty; though I have learned to try to make my hees pay, as well as to gratify my inclina-

Commence with a few colonies. One of these, at least, should have a pure Italian queen, and the combs in the hive occupied by her should be straight and nice. Get a copy of Professor Cook's Manual of the Apiary. I recommend this work, not because there are not other good works on the subare not other good works on the subject, but because Cook's Manual is not only a practical but a scientific work only a practical but a scientific work as well. Subscribe for a bee paper, and let that paper be the American Bee Journal. If you can't afford to take but one, let it be the best one. With this small outfit you can make a start. Read up the subject, learn to handle your bees frequently, espe-cially your tine gentle colony, at the start; lift out the frames and learn to "hunt up" the queen; show her to your friends and neighbors when they come to see you. Always keep a good bellows bee-smoker at your side. Never let your bees "boss" you; avoid, however, the mistake so common with the inexperienced—deluging the bees with smoke. Just give a little smoke when they appear to rebel—just enough to keep them quiet.

If a bee is pinched by you and stings you on the hand, remove the sting with you on the hand, remove the sting with your thumb nail and suck the place between the lips, and don't halloo "Ouch!" like an idiot, or be so reckless as to thrust the same hand back among the bees immediately. The odor of the poison will be sure to be taken as a signal for the fray, and you will get more stings. A beesting is really nothing when one has just a little philosophy in his composition. I have a supreme contempt for the awful dread which most people seem to delight to nurse and exhibit on all occasions, when they hear the gentle hum of the busy bee. I have seen edu. casions, when they hear the gentle him of the busy bee. I have seen edu-cated (?) men, men sleek with knowl-edge (?) bending under professional cards and responsibilities, strike with terrible energy at an inoffensive, fired bee which, by chance, attempted in its

innocence to make a resting place on the person of this wise (?) man. After the beginner has learned to distinguish one from the other—the worker cells, drone cells and queen cells—and is able to trace the history of the beg from the egg to the perfective cells—and is able to trace the instory of the bee from the egg to the perfectly developed bee, he can begin to rear some queens, practice artificial swarm-ing, introduce queens; in short, make his bees subservient to his will.

For the American Bee Journal.

Fertilization in Confinement, etc.

REV. L. L. LANGSTROTH.

I have been engaged in a series of xperiments on fertilization in coninement, the results of which, if they had proven favorable, I intended to send to the BEE JOURNAL. The extreme heat has been against them, but

treme heat has been against them, but I am afraid that we shall find nothing reliable where the queens are not allowed to fly at their will.

With great regret I notice the poor success which Mr. Benton has had in his efforts to secure Apis dorsata. I have always hoped more from a cross between this bee and some of our best varieties than from the pure document. varieties than from the pure dorsata; and wish that Mr. Benton had been able, when in its vicinity, to test the feasibility of getting such a cross. A feasibility of getting such a cross. A few nuclei with virgin queens might have given us the desired cross. As the Cyprian bees have been introduced into Ceylon, thanks to Messrs, Jones and Benton, it will now be a comparatively casy matter to see whether the wild dorsata drones will mate with Cyprian queens. Mr. Benton's researches have shown some strong points in its fayor; and that its strong points in its favor; and that its ferocity is by no means to be dreaded.

I thank you for your kind notice of my remarks on grape sugar and glucose. When we have proof that these articles can be made pure and are sold at prices which will lower the cost of our commercial sweets, and when sold under their way proposition. under their own names they are sought pay, as well as to gratify my inclinations to pry into their matchless ways.

The first advice I should offer would be "make baste slowly" at the start.

London Journal of Horticulture.

Alteration of Sex in Eggs.

A. PETTIGREW.

What more unlikely and wonderful an this? What harder to believe than this? than the statement of fact that all the eggs of queen bees are naturally and originally male, many of which are changed and become female in charchanged and become female in character in passing down the bodies of the queens? In the history of bees many wonderful points strike the thoughtful students. One of these is the well-established fact that all eggs in their origin are male and convertible into the opposite sex. For nearly 40 years I believed that all eggs had by amen hope were all the male and convertiby queen bees were alike, and convertible by after treatment into queens, drones, and workers. By a fair and satisfactory experiment made in my own garden I found that this was a mistake; that the notion was altogether wrong; and the eggs as they fall from queens are either male or femule and remain mechanically in that male and remain unchangeable in that respect, but the eggs which are "fe-malised" in character before they are laid are convertible into either queens or workers by after treatment in their cells. It has been long known days in hatching, and which may be placed in royal cells by the bees and hatched as queens in 14 days. Though the mystery of this change or trans-formation in the cells is great it is not a change of sex, for both queens and workers are female, the one perfect or fully developed, the other imperfect; but whether the special after treat-ment is applied to eggs in royal cells or to those in worker cells is an un-settled purefect. settled question. If the special treatment be given solely to royal cells, if the inmates are royally fed, we have some reason to believe that the some reason to believe that the treatment is meant to develop and perfect young queens in every respect. If the special treatment is applied to the eggs in worker cells it will go so far to prove that it tends to dwarf the insects and interferes with their development. The whole of this interest opment. The whole of this interesting subject is clouded in mystery. Everywhere we have evidence of design and wise arrangement, and see sign and wise arrangement, and see cells provided for the cradling of young queens, bees and drones, and suitable, too, for acting as reservoirs for honey. In considering the subject of treatment that the 3 kinds of bees receive in their cells, it should not be forgotten that queens are only 14 days in their cells, bees 21, and drones 24. This subject, beset as it is with difficulties, presents a wide and with difficulties, presents a wide and interesting field for future investigation, as it is to be hoped that apiarian students will turn their attention to it.

That "all eggs in the ovaries of queen bees are naturally and originally male, and develop as males when laid without being impregnated, but are changed to female if impregnated before being laid," is a statement of Baron Berlepsch, the truth of which has been illustrated and confirmed by extensive experiments and well-es-tablished facts. Notice first that un-mated queens are not unfertile, they hard queens are not untertile, they lay male eggs. Some queens are latched with defective wings and cannot fly, and, as queens are mated outside their hives, those that cannot fly remain virgin. Many queens perfect and able to fly remain so by misfortune or inclement weather. Many of these queens lay eggs which are capable of batching into drones only. Such queens are drone-breeders.

Such queens are drone-breeders.

Now notice that queens mated in early life are capable of laying both male and female eggs. Those who have investigated the subject say that in the body of the queens there are small sacs, by name, spermatheca, which receive and retain for use the sperm, that queens have the power of using it at will, and that all eggs touched by it in passing are changed from male to female. This will appear to many students of nature to be anomalous and extraordinary. As queens live 4 years and are wonderfully prolific, the contents of their

spermatheca are sometimes exhausted before they cease laying, or rather be fore they die; the eggs laid after the spermatheca has been emptied remain male and hatch into drones. Though we have had many queens die of old age, and have known many hives of our own bereft of their queens by age, we have never known a mated oneen we have never known a mated queen to become a drone-breeder merely in in her old age. We have seen queens by reason of old age totter and stag-ger as they walked, others dethroned and cast out of their hives in a state of dotage, and one this year lost a limb and could not walk on the combs, but fell to the board again and again. All these continued to lay female eggs till the very last. Other teachers, among them Dzierzon, Berlepsch, and Woodbury, have had fertilized queens that became simply drone breeders and the statements of these able men are trustweethy.

and the statements of these able men are trustworthy.

If other proof be wanted to estab-lish the statement that all eggs of queens are naturally and originally male, it will be found in the fact that from the parameter of different traces. from the parents of different races, say from Ligurian queens and common drones, we have no half-bred males. Paternal influence does not affect the direct male progeny; in-deed half-bred drones are an impossibility. While young queens and working bees are decidedly cross-bred, working bees are decidedly cross-bred, the direct male offspring share no influence but that of the mother. Let me now call the reader's attention to a nice point or distinction between the words "half-bred" and "cross-bred," also between "direct" male progeny and "indirect." While drones have no half-bred—that is to say, direct male progeny, there is the possibility, nay, the liklihood of the second and third generations catching up and possessing some of the characteristics of the grandfather. This is the idea of the grandfather. This is the idea I wish to convey, that while drones have no sons of their own they may have daughters which may carry the characteristics to future generations of both male and female offspring. The both male and female offspring. The history of drone life is stranger than fiction, and is perhaps without a parallel in natural history.

Again, it is known that some work-

ers lay a few eggs which invariably hatch into drones, and as workers are imperfect females, incapable of fecundation, these fertile workers lend some small additional proof to support the statement that all eggs of bees are

statement that all eggs of bees are originally of a male character.
This subject is fully discussed and elucidated in a small pamphlet, by the late Baron Berlepsch, called "The Dzierzon Theory," On page 26 the Baron says "that queens' eggs are susceptible of development though unimpregnated, but masculinity still mercely is therein, which marvallons pre-exists therein, which, marvellous indeed I is transformed into feminity by impregnation with the male sperm. I am anxious to attract the attention of my readers to this portion of the theory, for it is the most important of all the propositions I have undertaken to discuss. With its aid almost everyto discuss. With its aid almost everything relating to bee-culture becomes intelligible; without it hardly anything is clear. He who does not fully comprehend this point will grope in the dark in all his operations, and be constantly exposed to mistake and disappointment." appointment." London, England, June, 1881.

them to generate, during winter, the warmth necessary to their existence. It seems that their instinct directs them in the selection of their abodes; for, at Borneo and Sumatra, as well as between the tropics, they feel that to inhabit a hive is unnecessary, and they build their comb under the limbs of big trees; while in northern climates they seek the protection of hollow trees. The motion of the sap maintains inside of the tree a temperature above that of the outside. In northern Russia the travelers, astonished at tion of hollow trees. The motion of the sap maintains inside of the tree a temperature above that of the outside. In northern Russia the travelers, astonished at seeing so far north so many bees, wonder how so small an insect can resist the severity of sneh a climate. To own bees, as domestic animals, man, who inhabits so varied countries, had to provide them with dwellings snitable to the different regions in which he was located. Thus different materials were used to make beelives. In some parts of Africa beekeepers use hives made of sticks joined together with wooden ligatures. In Arabia, in Egypt, in Cyprus Island they use earthen jars, as in some parts of southern Europe. Farther north they procure gums; farther yet, straw twisted and fixed with willow twigs. But as bees are indigenous to a warm climate, very often these protections prove insufficient; then some tried to protect their colonies by putting them in places where cold could not penetrate.

ting them in places where cold could not penetrate.

In the middle of Russia they dig wells 20 or 25 feet deep. They pile in them their bees, which are in gums; the gums are placed horizontally, the lower part of the gum remaining open. The well is thus filled to about six feet from its top. Then a cabin, made of straw, is built upon the well, and the bees are left to themselves for five or six months. In localities, not far distant from old quarries, or from dark natural caverns, the bee-keepers bring their bees in these for winter. Others bury their hives in soils, and succeed well, when the ground is not too wet. Some put them in cellars, or in buildings, especially made for the purpose.

All these means, although good in themselves have sometimes turned to disasters. Such losses cannot be ascribed to fatality, but to some wants of the bees which are not fulfilled. Not the apiarian science, but change had directed the cares be.

but to some wants of the bees which are not fulfilled. Not the apiarian science, but chance, had directed the cares bestowed; and when the winter was over the bee-keeper reckoned a great many losses, which he was unable to explain. He had prepared his bees the same as in the preceding years; the same as did his father and his forefather before. Then with a simplicity similar to the dark ages, he imputed his losses to the fault that he had made, by selling for money a few of his colonies; or by forgetting to put a black crape on his hives at the time of the last death which occurred in his family. in his family.

Now, thanks to the studies of our prede-

Aow, thanks to the studies of our predecessors, the conditions of a successful wintering are better known; and when a loss occurs in the apiary, the bee-keeper cannot impute it to any other cause but his lack of knowledge or foresight, or of good wearenessed.

good management.

Before going farther in our subject, let us examine first what happens in a colony during winter. There is a fact that a bee-keeper ought not to lose sight of: it is during winter. There is a fact that a beekeeper ought not to lose sight of: it is that bees, in winter, do not inhabit the combs which are filled with honey. They gather directly below the sealed honey; the mass of the bees, on every comb, being congregated in the form of a disk. On this disk the bees hang imbricated, like the shingles of a roof. Every bee has its head under the abdomen of the bees immediately above; and so on, to the bees which are close to the honey. These last bees suck honey and give some to the bees immediately below; these do the same for their neighbors; and so on, to the last bee of the group. As soon as the honey of the first attainable cells is exhausted, all the mass move upward to reach the full cells till the top of the comb is reached. Experiments show that the temperature, inside of the group, is about 70 degrees. As long as such temperature is held inside of the group the bees remain motionless, almost sleeping. It the temperature of the mass decreases, the bees who teel the cold generate warmth by a beating of wings. This motion sends some warm air downwards to warm the bees, which are altogether under the group. It is for cold generate warmth by a beating of wings. This motion sends some warm air downwards to warm the bees, which are altogether under the group. It is for this cause that, when the weather is very cold, we can hear the humming of our bees inside their hives. But by beating their wings bees digest faster; then the consumption of honey increases. Such is the cause why a colony ill protected consumes more than a colony located in a place where the temperature is suitable. where the temperature is suitable place where the temperature is suitable. This increased consumption explains also why the intestines of bees, in winter, are soon filled in unprotected hives.

When the temperature keeps warm, the neen, who dwells in the middle of the queen, who dwells in the middle of the group, begins to lay, then water is needed to help in feeding the brood. If the colony has wintered outside, the daily alternative protection around it is itself sufficient to protect them on their summer stands, in the protonged with the protonged wit with the protonged with the protonged with the protonged with t

tives of warm and cold give to bees the tives of warm and cold give to bees the chances of going out for water, or procure it inside the hive, by the condensation of the steam produced by breathing. If the bees are in a cellar, or in some other winter depository, when the rising of the temperature excites the queen to lay, as there is no condensation of steam, the bees become restless on account of the dearth of water

er. ow that we know how bees behave in Now that We Khow now news ochare in the hives during winter, let us see how to prepare them for a safe wintering. The first thing is to ascertain that every col-ony has a queen, and to see whether our colonies have enough bees to keep the right temperature in the group. When colonies have enough bees to keep the right temperature in the group. When we find a queepless colony, it is an easy matter to unite it with some weak colony having a queen. We can also unite two feeble swarms, to make a good one. As to the number of bees necessary for a good wintering, that will depend on the cares and the means that the bee-keeper can use to protect his bees. A colony numbering 10,000 bees or less, about two pounds, can be successfully wintered if well cared for.

pounds, can be successfully wintered it well cared for.

We have now to resolve the question of wintering our bees inside or outside. If outside, let us keep in mind that, in cold spells, bees cannot pass from one comb to another, and can starve on an empty comb besides fall over out of their reach. This fact, which gives to the large combs a superiority over the small ones, led to the practice of punching a few small holes in the combs. Such care is not taken as regularly as it ought to be: and I, for one, have too often regretted my neglect on that account, when my bees starved with a quantity of honey in the hive.

For the same reason and in order that bees could more easily warm their groups, it is indispensable to take all the empty combs, reducing the number of the combs to the space that bees can occupy, on con-

it is indispensable to take all the empty combs, reducing the number of the combs to the space that bees can occupy, on condition, nevertheless, that we leave honey enough to winter on. Of course, it some of our colonies have too much honey, while some are poor, it is an easy matter to take one or two full combs from the rich ones to give to the poor. It is generally admitted that 15 or 18 pounds are enough for a colony to winter on; but it is safer to leave more rather than less. But do not waste honey; a colony with ten pounds more than what is necessary will, on an average, be in better condition for the crop than one with 10 pounds less. The next precaution is to see whether the honey is of good quality, M. Maurice Grard, a French scientist, in a book entitled "Les Abeilles," says that honey is composed of crystallizable and uncrystallizable sugars. The crystallizable sugar is easily and completely digested by bees, while the other is of a more difficult and incomplete digestion. It is for that reason that pure cane sugar is better than honey for winter. For the same reason spring honey is better than fall honey; honey dew is still worse, and the juice of fruits are the worst substances for wintering bees.

Very often it happens that bees have

are the worst substances for winnering bees.

Very often it happens that bees have put honey in cells partially filled with pollen, and sealed them. This fact is easily ascertained by looking through the combs. The cells containing pollen have no transparency. Not only the quantity of honey is smaller in these combs, but this honey is unsafe for winter, on account of the pollen which, eaten with honey, compels the bees to void their feces often. A colony living on pure honey will endure 5 or 6 weeks of confinement, while one with impure honey will get the dysentery if unable to fly out when needed.

when needed.

Unsealed honey is unsafe also on account of the water that it contains, and of the water that it gets during winter, by the condensation of the steam generated by bees in cold days. The condensation sometimes fills the cells containing the unsealed honey, so as to appear in large round drops, held on every cell by capilarity, and ready to run out at the slightest jar. When the capillarity is no longer able to hold these drops they run out of the cells, and the bee-keeper seeing this sugared water at the entrance of the hives, wonders how it is produced. Bees cannot winter on such matter without becoming sick. We therefore will act wisely in taking out all the frames containing unsealed honey, especially when the number of such frames is very large. After winter these combs will greatly help the colonies in brood-rearing.

When the quantity of sealed honey seems to be insufficient, the provisious can be completed by syrup made from coffee A or granulated sugar, dissolved in warm water. The quantity of water ought to be 1 pound and 1 ounce for 2 of sugar. Let me here advise bee-keepers not to use glucose, or grape sugar, for winter. Unsealed honey is unsafe also on ac-

to use glucose, or grape sugar, for

yet I advise to put under the bottoms of the hives some dry material, such as dry leaves or straw, and some also on the top of the frames. I suppose that our hives have a cap, as in the Longstroth or

of the frames. I suppose that our hives have a cap, as in the Longstroth or Quinby, or that they are double story. We take out the cloth, which ought to cover the frames, and replace it with a mat, made of seed or straw, then we fill the cap with straw or dry leaves.

If we have single walled hives, there are several ways of protecting them. We begin by preparing the inside. In the room made by reducing the number of combs we place a partition board, or some kind of cushion, and fill the interval with dry leaves or chaff. Then we fill the top, as above, with some warm and absorbent material, to rid the bees of the dampness produced by the digestion and the respiproduced by the digestion and the respiration.

At one time I forgot to prepare a good colony for winter. This colony had 7 Quinby frames, without partition, in a hive of the capacity of 11. It had neither cloth nor honey board, above the combs. In the spring I found the family greatly reduced in numbers and all the honey gone. All the combs were wet, as also the sides of the hive, and the cap. The dampness having lasted all winter, the boards were soaked and blackened. To rescue this unhappy colony I had to put it in another hive, and give it dry combs. Some bee-keepers advocate a current of air in the hives; a current that carries away dampness. This method will do for southern climates, but it increases the con-

away dampuess. This method will do for southern elimates, but it increases the con-sumption of honey too much for the north-ern States. Yet, had I to choose between a current of air and a tight closed top, with-out other protection, I would prefer the first

At one time, while preparing my bees for winter, I was interrupted by a sudden change of the weather. For a few days the weather was very cold. When I resumed the work, I found the under cloth sumed the work, I found the under cloth and part of the combs in every hive damp and covered with iee. I then opened, for comparison, a number of the hives on which I had put a mat with dry leaves. The combs were dry, in every one. At noon of the same day, I noticed water running out of the unprotected hives, while the entrances of the protected ones were dry.

ning out of the unprotected hives, while the entrances of the protected ones were dry.
But, in our climate, the inside partition is not sufficient to winter, on their summer stands, single boarded hives; and we have to provide an outer coat for them. It results, from experiments made, over 100 years ago, by Klaumur and by Gelicu, that very small colonies of bees can be wintered safely, if the protection is sufficient. They put straw hives, containing weak colonies, in boxes filled with straw or dry earth; after preparing channels, through which bees could fly out. The bees wintered perfectly. A number of bee-keepers in this country have tried this method, with excellent results, and was not this way too cumbersome and ex-

mis method, with excellent results, and was not this way too cumbersome and expensive I would recommend it.

For outer protection to our single walled hives, we use dry leaves or straw. We gather this material around the rear and gamer this material around the rear and sides of the hives, and tie it about the hives with a kind of rope ladder, made with 12 or 15 laths, 20 inches long, and 2 strings tied together, in front of the hives. This protection is sufficient. When wingle is a year we reall our seal laths. This protection is sufficient. When winter is over we roll our cord ladders and put them in the garret. We do not put them in front of the hives, for bees need them in troit of the lives, for bees need every warm spell, to fly out of the live. I know a German bee-keeper who killed his bees by preventing them from flying out in winter, by means of a wire cloth placed before the entrance.

Far from advising bee-keepers to use

placed before the entrance.
Far from advising bee-keepers to use such precaution. I will give a suggestion which is altogether the reverse of it. A few years ago we had a very cold and long winter. For 7 weeks our bees were constructed in their bitters and construction. winter. For a weeks our bees were confined, by cold, in their hives; and such a cold! One day I saw the thermometer at 37 below zero. On the 16th of January the weather being warm I hastened to the apiary. Of course I opened the weak ary the weather being warm I bastened to the apiary. Of course I opened the weak colonies first. Every one was alive. Satisfied with the result. I did not disturb the strong colonies. They did not on this warm day fly out; while all the small ones, awakened by my visit, filled the air with their lummings. The cold weather came again for 3 weeks more, and I found that all my strong colonies were reduced in numbers, or dead, from dysentery; while every one of the smaller ones were alive and healthy.

Now after a spell of more than a week of cold weather, as soon as the thermometer rises to 45°, in the shade, I disturb every colony to compel their bees to fly out. I am not deterred from disturbing them even by snow, if their confinement has lasted 2 weeks; for the loss of a few bees, falling in the snow, is little, when put in comparison with the risk of a confinement prolonged 6 or 7 weeks, or more. Of course such a disturbance would not be designed.

groups, and the cold benumbs and kills every bee that leaves the mass; for al-though the temperature of the central part of the cluster is about 70; the outside of the cluster is sometimes below the freez

ne cluster is sometimes below the tire?
ig point.
Every colony wintered on the summe stand ought to have, as far as possible, its entrance turned south and its bottom slant-

ing, so as to let the water generated by the bees run out of the hive.

From time to time it is well to see whether the entrance is free from dead bees or ice; for the lack of air would kill the selection.

whether the entrance is free from dead bees or iee; for the lack of air would kill the colony.

For a good wintering in a cellar, or other winter depository, the first precaution, after looking for the queens and the provisions, is never to put the colonies in the cellar after a few days of cold weather; but to wait till the morrow of a day during which bees have had a good flight. The reason of such a precaution is obvious. Our bees will be confined in the cellar for months; if we put them in the cellar when their intestines are empty, as they are after a good flight, they will easily endure a long confinement. As bees, after 4 or 5 months, remember the location of their hives, care ought to be taken to mark the place that every one occupied.

The hives can be piled in columns of 4 or even 5, with the precaution, if they are piled without bottoms, to put a few laths between them, to prevent the mixing of the bees.

The cellar ought to be as free from mice

the bees.

The cellar ought to be as free from mice as possible. The bees ought to have good are correct of air, by

the bees.

The cellar ought to be as free from mice as possible. The bees ought to have good ventilation. I mean a current of air, by opening the entrance if the bottoms are nailed, and the cloth glued at the top.

The cellar ought to be dark and easy of ventilation, without admitting light.

The temperature of the cellar ought to be about 45; or 43; when the bottoms are nailed to the hives. When the temperature is suitable, it is only with an attentive ear that you can detect the humming of the bees. This humming increases as the temperature increases or decreases. When the room is too cold, the bees generate warmth by beating their wings; when it is too warm, they roam on the combs, impatient to go out. The temperature can be raised by shutting the outside apertures of the cellar. It can be lowered by opening the windows at night if the nights are cold, or by putting in the cellar some ice to melt; the drippings of the ice should be received in a vessel. When all these conditions are fulfilled, bees can be left in the cellar for 4 months without suffering.

without suffering.

To replace the colonies on their summer stands, select a day promising to raise above 45, in the shade, and hasten to bring stands, 'select a day promising to raise above 45', in the shade, and hasten to bring out all the bees before noon, so as to give them a chance of flying out, on the same day; for a confinement in the hives by cold, when their bowels are full, would be fatal to a number of workers. If the bees do not suffer in the cellar, they will act as if they had wintered on their summer stands; but if they have been restless for days and weeks, as is sometimes the case when February and March are warm, some colonies will swarm out of the hive in which they have suffered. When such desertions begin in the apiary, it is difficult to prevent them from inciting other colonies to follow the impulse. When such trouble is anticipated, we ought to be careful to bring out only a few colonies at a time, waiting to bring more till the excitement produced by the first flight has subsided. One of the causes of such untimely swarning is the lack of water, caused by the failing of brood, for the queens lay in the cellar when the temperature rises; but the bees cannot find water to feed the brood, since there is no condensation inside the hive.

but the bees cannot find water to teed the brood, since there is no condensation inside the hive.

I will not speak on wintering bees in closed bee houses, for such buildings are not fit for our country. If the temperature of the closed room is cold, bees are not better than on their summer stands; if it is warm, bees are incited to fly out in cold days and cannot return.

To sum up the above, for a successful wintering of bees, every colony ought to have a queen; a sufficient quantity of suitable food; a protection against cold and dampness; an absolute quietness during cold spells, with a chance to fly out every time they need it, if wintered on their summer stands, or an equal and suitable temperature if wintered in dark celars.

When these conditions are fulfilled, we

lars.
When these conditions are fulfilled, we such is When these conditions are turnined, we can be assured of a good success. Such is the result of my observations continued for 17 years, in which, having begun with 2 colonies, and sold several hundred, I have enough left to people 5 apiaries. Hamilton, Ill.

The Northwestern Illinois and Southwestern Wisconsin Bee-Keepers Association will hold its next meeting Aug. 30, at Rock City, Stephenson Co., Ill. JONATHAN STEWART, Sec.

### THOMAS C. NEWMAN.

EDITOR AND PROPRIETOR,

CHICAGO, ILL., AUG. 3, 1881.

### International Congress in Italy.

We have received the following very kind invitation to attend the Italian International Congres:

Milan, Haly, July 1, 1881.
Honorable Monsieur: The International Congress of Apiculture will be held in Milan, on Sept. 15, 16 and 17, 1881, and the President of the Central Association for the promotion of apiculture in Italy, being desirous of making the Congress the sirous of making the Congress the most productive of good results, and at the same time to subserve the interests of apiculture, by promoting the progress and prosperity of the industry, is very desirous of obtaining the attendance of the most renowned apiarists of the world. I have, therefore, the distinguished honor and extreme pleasure of sending you this most cordial invitation to attend our Assembly.

Assembly.

The Society would be extremely The Society would be extremely pleased to have the honor of your attendance, and would deem itself very fortunate by your participation in the discussion of the important topics and interesting themes that will be brought before the Assembly.
Should you, however, be unable to

attend personally, will you be pleased to put your views on some topic of in-terest in writing, and submit it to the Congress for discussion, by those who

will be in attendance.

The Industrial Art Exposition will be held in Milan, and will remain open until the end of October. Railroad fares will be much reduced, and many other inducements will be offered to attract visitors at that time to our Congress.

The President has the honor to present you, Sir, his most cordial felicitations.

A. CADELIN, Cor. Sec.

We shall ever have occasion to remember our visit to Milan, Italy, and, while memory holds its sway, we shall never forget the pleasant hours we spent with Count Barbo, the President of the Society, and also with Count Alfonso Visconti de Saliceto. the able editor of L'Apicoltore, the organ of the Society, and exceedingly regret that our duties in connection with the BEE JOURNAL will not permit us to accept their cordial invitation to be present at the International Congress.

We have, however, promised to send a letter to the Convention, in French, on "Progressive Apiculture," to be read and discussed by the noted apiarists that will be present, and hope that the Congress will be deeply interesting to those present, and of vital importance to progressive apiculture the world over,

Prof. Vennor's weather predic-tions for August are: First week, pleasant days with cool evenings and pleasant days with cool evenings and nights; second week, hot, cloudy and sultry days, with cooler nights; third week, cooler weather, with storms in Virginia, ending with hot, cloudy weather and storms; fourth week, sultry and windy weather, with heavy storms on the lakes, St. Lawrence river, and around New York; fifth week cooler with rains and frosts in week, cooler, with rains and frosts in the North and pleasant days with cool nights further South, with indications of returning heat.

### Journal of Chemistry on Glucose.

We are in receipt of the following letter, relating to an editorial which appeared in the Boston Journal of Chemistry for July, 1881:

Mr. Editor: Allow me to call your attention to an editoral in the Boston Journal of Chemistry, on glucose. I have ever been accustomed cose. I have ever been accustomed to place almost implicit confidence in Dr. J. R. Nichols, Editor of the Journal of Chemistry, as a reliable chemist and assayer. He has for many years manifested a deep interest in exposing frauds and adulterations of articles in common use, both as foods or read. in common use, both as foods or medieines. I was not prepared lo see just such a position as he takes on manusuch a position as he takes on manufactured glucose in the July number of his Journal. If what he says is true, then it seems to me we may bid farewell to the thought of ever bringing honey—especially extracted honey—into very general use. It cannot be produced as cheaply as glucose from corn. He thinks the glucose of compared not wartigularly poisonous but merce not particularly poisonous, but only a swindle by selling it for more than it is worth as a sweet. Please tell us what you think of it.

D. K. BOUTELLE. Lake City, Minn., July 6, 1881.

As we have so often unmistakably committed ourselves on the subject of food adulteration, and, in fact, against every artifice for obtaining money fraudulently, we do not feel authorized in commenting at length upon the article referred to by Mr. Boutelle. As there are no new developments, and the article is somewhat lengthy. we must content ourselves with making brief extracts from it. Dr. Nichols states facts very frankly and fairly, and evidently without any prejudice. Were all as candid and honest as he, the public would have but little to complain of. He is, of course, very guarded in his indorsements of glucose, and, to prevent misconception, in several places makes a prefix of the word pure to glucose. Nor does he intimate that a majority, or even a considerable portion of that sold is pure. but the contrary. The introductory paragraph is perhaps most objectionable, as it partakes more of sophistry. It reads:

Glucose is the sugar of the future. Oppose it as you will, it is daily in-creasing in importance and in the number of its uses. In climates where number of its uses. the sugar-cane will not grow, and in countries where the sugar-beet cannot be cultivated with profit, there is a wide field for glucose. Wherever corn, when hem for glucose. Wherever corn, grain or potatoes thrive, there glucose factories will flourish. Glucose differs as much from cane sugar as tallow from lard, or butter from oleomargarine. Both kinds of sugar are sweet although in a very different degree. and for many purposes one can be substituted for the other without the consumer heing aware of the fact.....

The uses of glucose are very numer

The uses of glucose are very numerous, although it is seldom sold to the public under its real name; but under the alias of "golden drips," sugarhouse syrup," strained honey," and even Vermont maple syrup, its sale is very extensive. It is largely employed by confectioners for making candies, by wine dealers for strengthening wine, by brewers to add body to their heer. Dr. Kedzie, of the Michigan Board of Health, reports that of 17 samples of table syrup tested by him, 15 contained glucose. Of 20 samples analyzed in Chicago, only 1 was unadulterated....

dulterated.....
We do not believe that pure glucose is an injurious substance when properly made, but to sell it under the name of cane sugar, when it is but one-third as sweet, is a fraud; and to charge the price of cane sugar, when it costs but three cents a pound to make it, is a medals, etc.

swindle. That it pays to make it is evident from the fact that there are more than twenty glucose factories in this country, turning out over one million pounds per day.

We are forced to disagree with Dr. Nichols as to the desirableness of glucose for any purpose, and think its importance as a commercial commodity is greatly magnified; and, like the Doctor, we do not object to its manufacture and sale as such, but the fraud and swindle all honest people object to. But few persons will care to buy even pure glucose, when they know it is but one-third as good as sugar or honey, and we cannot refrain from thanking the editor of the Journal of Chemistry for adding his testimony to the fact.

### Counterfeit Comb Honey.

We find the following article going the rounds of the press:

Prof. H. W. Wiley, in the Popular Science Monthly, records the amazing progress of the glucose industry. There are 20 immense glucose factories either built or in progress of construction. Already a capital of over \$2,000,000 is invested in the business. \$2,000,000 is invested in the business. The daily consumption of corn for the manufacture of glucose is about 35, 000 bushels, and the annual amount about 11,000,000.

It is hard to find a table syrup wholly free from this adulteration. Glucose is said to be present in most beer now brewed. The bee himself is not as busy as the glucose manipula-tor. The latter puts up a "honey" of which the waxen cells are made of which the waxen cells are made of parafine, and the contents consist of snow-white glucose. The fraudulent comb and honey are handsomer than the finest white clover "Vermont," and can be sold at half the price, at a greater profit. greater profit.

To the question, "Is glucose wholesome?" the Professor replies:

It all depends on the presence or absence of sulphuric acid, lime and cop-per, which are apt to find their way into the article through imperfect chemical treatment.

Prof. Wiley is greatly in error when he asserts that artificial honey combs are manufactured from parafline, filled with glucose, and sold as honey. The story originated in the fertile brain of some sensational newspaper correspondent, where the Professor probably obtained the idea, and accepted it as true, without investigating its possibility. As we have heretofore intimated, It has never been accomplished. The hoax has really done much harm, as many unthinking persons, knowing the prevalence of adulterations, have become prejudiced by it. Referring to this, we are in receipt of the following from Mr. R. Mayerhoffer, Prague. Austria:

I have read an alarming paragraph, published in the principal European papers, that an ingenious Yankee has papers, that an ingenious 1 ankee has constructed complete honey combs, and well filled them with honey. The capping of the cells must be a fine operation! It is impossible for man accomplish this miraculous work of ne bee. I have read the BEE lourthe bee. I have read the BEE JOUR-NAL, but have not found a notice of the humbug.

We have twice alluded to it, and denied its practicability.

The Ninth Industrial Exposition will be held at Cincinnati, O., Sept. 7 to Oct. 8, 1881. A large number of premiums are to be awarded, consisting of purses of gold, gold and silver terators. We do not like his poor sub-

### Premiums for Apiarian Exhibits.

We cheerfully give place to the folowing communication, as it touches upon a subject which we consider of vital importance to honey producers:

Council Grove, Kan., July 25, 1881.
EDITOR BEE JOURNAL:—The St.
Louis Fair Association offer preminms to the amount of only \$15.00 for honey and beeswax, while for beer, wines and tobacco they come down to the tune of \$450. Their honey preminms are less than half the sum paid by the Western National Association, at Lawrence, Kan., in 1880, and yet they are the centre, commercially, of a very large extent of territory in which bee-keeping is prolitable. which bee-keeping is profitable.

D. P. Norton.

There is, perhaps, no pursuit in the country so general in its location and so little understood by the great mass of our intelligent population as scientific bee-keeping; indeed, the knowledge of most learned men extends only to the facts that there are two kinds of honey kept on sale in most of the stores, namely, comb honey and "strained" honey—the former they buy, because they relish it; the latter they abhor, because it does not taste as honey did "when they were boys." Many do not understand why this is, and all have a distrust of liquid honey. People should be educated to an appreciation of the excellence and economy of all piae honey, and we know of no place offering as good facilities for a diffusion of that knowledge as the Agricultural Fairs and Expositions. For this reason State Vice Presidents and local Societies should make extra exertions to secure the award of liberal premiums at every Fair within their jurisdiction; should no premium be offered, the more need for a creditable display not only of comb and extracted honey, but all the implements pertaining to the apiary, and, if possible, a colony of bees; above all, do not forget the extractor, and a few combs of honey with which to illustrate its use. The omission of the premium is proof of theignorance, on the part of the executive committee. of the importance of the bee-keeping

All honest branches of industry find it a profitable investment of time and money to exhibit and advertise their products, and bee-keepers ought to have discovered by this time that they are not an exception to the rule. Liberal premiums, of course, stimulate competition, and competition develops superiority. Vice Pres. Norton deserves commendation for his energy, and he will give an impetus to progressive bee-keeping in Kansas that will accomplish much good.

Sorely Tempfed.—The following is clipped from a late number of the Farmers' Review, Chicago:

What are we coming to? men are accused of bnying oleomar-garine, and now a Louisiana sugar manufacturer is reported as having come to the conclusion that glucose will soon be largely used for mixing with sugar-house syrup. He offers the excuse that people will be better satisfied with such a combination syrup than with the pure article.

We are sorry the Louisiana man can not frankly tell the truth, and say that he is unable to compete with the adulterfuge of an excuse.

### MISCELLANEOUS.

Death of the N. Y. Adulteration Bill. The following we find in the Bec-Keepers' Exchange for July, and it has awakened a curiosity to know the persuasions brought to bear upon the Governor by the swindlers. If a percentage of their ill-gotten gains, then, how much?

We saw an item in a newspaper re-cently, which stated that the Governor of New York State had vetoed the bill regulating and punishing the adulteration of sugars, syrups, honey, etc.

Melilot as a Honey Producer. -Mr. F. L. Dougherty, in the Indiana Farmer, says:

The excessive hot weather during the fore part of this mouth burned up the white clover, shortening the seaon about 2 weeks. White clover did not yield honey so well as we were led to hope, by its condition early in the season, however our melilot is still holding its own, being covered with bees from early morn till late at night. Although not making surplus honey. the bees are getting enough for present use, enabling us to continue queenrearing, and the building up of nuclei, without feeding. Almost everything, except white clover, has yielded copiously this season, and we hope for a good fall crop of honey.

An Editor's First Experience with Bees. - The Fayetteville (N. Y) Record has an amusing account of the editor's first experience with a colony of Italians. At first he was filled with fear and dread of his "little pets;" but now, seeing such a good result of their summer's work, so far, he is beginning to love them just a little. They were a present from Mr. George W House, of that city, and Mr. H. has given the editor instructions and practical lessons in the management of the colony. His outburst of admiration is given in these words in the Record of last week:

The 28 boxes placed there a few weeks previous were all filled. Mr. House informed us that this was an unusual product for this season of the year. Forty-six pounds of new honey. year. Forty-six pounds of newhoney, and a new colony is, we think, a pretty good opening before the first of July. If any person can beat it we want to hear from them. Mr. II. says that 10 or 12 pounds more would undoubtedly have been obtained had the boxes been removed several days previous. the also informs us that we may safely count on from 160 to 200 pounds of honey this season from our Italians. It may be that the colonies are extraordinary workers, but undoubtedly the arrangement of the hive facilitates their labor. To whatever cir-cumstance the product may be owing, we are satisfied with the House bee hive.

Poisonous Honey.-The Bienen-Vater, published in Vienna, Austria, gives the following bit of history, from an English work, on poisonous honev:

The English Blue-Book of the Department of Commerce, which has lately appeared, contains a report of Vice-Consul Bilicki, in regard to the trade at Trapezunt and the surrounding districts, in which, in a singular manner, an ancient classical writer receives due credit. Xenophon namely relates, in his Anabasis, that many of

his soldiers were taken sick after eathis soldiers were taken sick after eating wild honcy from the valleys near Trapezunt. The Vice-Consul states that, although a great many bees were kept in those regions, not one would eat of the delicious honey which they produce. Whoever did so, ignorantly, soon after experienced dizziness, began to vomit, and fell into a stipor, and, sometimes, even death would follow. Bee-keeping is carried on solely on account of the wax. on solely on account of the wax.

The cause of the injuriousness of

this honey is to be found in the fact, that in these valleys, there grows in great abundance a poisonous plant, the deathly nightshade, from whose beautiful flowers, rich with honey, the bees gather the delicious, but poisonbees gather the delicious, but poison-ous honey. Upon the heights where these plants are not found, the honey that is gathered—there is fit for eating and not injurious. By this statement, Xenophon receives confirmation.

Besides, this poisonous honey is also to be found in other regions, where poisonous plants luxuriate.

Feels Proud of the Weekly.-The Kansas Bee-Keeper makes the following remarks about the Weekly Bee JOURNAL, and has our thanks for the "kind words" which are there expressed:

The American Bee Journal was The AMERICAN BEE JOURNAL Was established in 1861, and is the oldest bee-paper in America. It was published as a monthly until January, 1881, since which time it has been issued with the state of the s 1881, since which time it has been issued weekly, it being the only weekly bee-paper in the world. Its advent as a weekly marks a step in the progress of apiculture, of which the bee-keepers of America can justly be proud. Mr. T. G. Newman, its editor and proprietor, is an able and carnest defender of the right and carnest defender of the right and contact of fender of the right, and outspoken in his demuneration of that which is wrong or has a tendency to cast a shadow of reproach upon the fair

name of our chosen pursuit.

For his energy and perseverance in giving us a weekly bee-paper, and the efforts put forth to impart useful and reliable information on all subjects pertaining to bee-culture, his paper should receive the patronage of every bee-keeper.

Ginger Honey Cakes, -A German paper gives the following receipt for making a superior quality of tine honey cakes:

Let a pound of honey boil up in a brass kettle, then add to it one pound of sitted sugar, 14 lb. of coarsely ground almonds, 2 whole eggs, the ground almonds, 2 whole eggs, the yellow peel of a lemon, grated, a little candied orange peel and citronate ground fine; then gradually add card-amins, cloves, cinnamon, and about <sup>1</sup>/<sub>2</sub> lb. of fine flour, and stirring dili-gently. After having mixed the whole well, add <sup>1</sup>/<sub>4</sub> ounce of potash, dissolved in a little water, and a glass of rum; then convey the whole mass upon a vermicelli board, covered with flour, knead with it as much flour as will be necessary to form a dough, roll this dough out to the thickness of a leadpencil, cut it into sizes to suit you, and bake it upon a baking-tin at a moderate heat, until light brown. By covering the pieces while hot, with a boiled solution of sugar, using a brush in doing it, the cakes will gain a pretty color and greater sweetness.

Scientific Bee-Keeping. -The Editor of the Linneus (Mo.) Bulletin gives the following notice of his visit to the apiary of Mr. J. S. Duncan, Browning, Mo., one of the best and most progressive bee-keepers of that State:

for we know the pain a little bee can give—but we were fully assured there was no danger, and without veil, gloves, or any other protection except get a start at robbing, it is, at times. gloves, or any other protection except get a start at robbing, i a little smoke, he opened a hive and very hard to stop them.

lifted out frame after frame and showed queens, drones and bees; the different sizes of honey comb, worker, drone and queen cells, the distinction between the Italian and Cyprian bees, as these are the only kind he keeps. His bees are worked for comb and extracted honey. The honey extractor is a marvel of simplicity; the frames of comb filled with honey are lifted from the hive and set in the extractor, before you know what has been done the comb is emptied of its precious load, ready to be set back in the hive to be refilled with honey again. In this way a large amount of honey can be taken from each colony in a short time, as the bees have no comb to make, which is the most expensive article in the bee hive. This, our first This, our first visit to an apiary managed on scientific principles, was amusing as well as instructive, and to all any way interested in the honey beewe would advise to call and see Mr. Duncan and his bees.

The Krainer Bees.—The Bienen Zeitung contains an article from Hern Michael Ambrozie, of Moistrana, Krain, Austria, on the Krainer bees. The writer is a very enthusiastic admirer of that variety, and gives some information concerning it in its native home. From his article we give the following extract:

The profits of the apiary in Germany and Austria, are estimated to be 45 per cent, on the capital invested. But bee-culture depends largely upon the hardiness of the race of bees, and their propensity to gather honey. Krainer bees, in these respects, must be preferred. The rough climate of be preferred. The rough climate of our mountainons country has made our bees a hardy race, for they have been hemmed in by mountains for centuries. Our bees fly in dark and cool weather, and suffer very little from dysentery and other spring maladies. The rich mountain meadows and forests of Krain, with their profusion of bloom, animates our bees in the spring, and we often find them flourishing in Marchand April, breeding early and beginning early

My apiary is situated but 1½ miles from the Mountain Triglay, which is 9,000 feet above the level of the sea, and its north side is covered with eternal fields of ice, but for all that my hardy Krainer bees visit the herbs on the rocks in March and April, showing that they will succeed in any country, for they are used to rapid changes of temperature, and I can recommend them for importation to any country. Our bees are proverbany country. Our be ially kind and gentle.

How to Prevent Robbing, etc .- At this time, in the absence of sweet clover, robbing is liable to prevail. The Indiana Farmer makes the following suggestions:

Weeds or small brush set up before the entrance to hives will prove conthe entrance to inves win prove considerable of a barrier against robbers, as they dislike very much to approach the entrance by winding passages. For very bad cases of robbing, a wet cloth lung over the entrance and kept distriction of the control of the contr

dripping is generally very effective.

Bees use large quantities of water during the hot dry days of July and August. If they have not an ample supply handy, it should be provided them in some kind of an open vessel, in which floats must be blaced to keen in which floats must be placed to keep

During the drouth, which usually lasts until about the middle of Auasts until about the middle of August, the bees are much inclined to rob, therefore the entrance to all weak colonies or nuclei should be made Mr. Duncan is an enthusiastic and small to enable them to better protect practical bee-keeper. By invitation, themselves from robbers. In this we reluctantly visited his bee-yard—case, the rule that an ounce of preventions.

IF In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.—ED.

The time selected by the Executional Convention, at Lexington, Ky., is October 5, 6, and 7, 1881. All beekeepers are invited to attend and take part in the deliberations of the Convention. As Lexington is a central point, the Executive Committee hope to have a large attendance from the to have a large attendance from the the North, South, East and West, and from Canada, and that the 12th annual meeting of the North American Bee-Keepers' Society will be the most interesting meeting that the bee-keepers

of the United States have ever held.

The National Convention will be held during the time of holding the St. Louis Fair and the Expositions at Cincinnati and Louisville, and that all passing through those cities can get the leavest of excursion, rates the benefit of excursion rates.
N. P. Allen, Pres.

The Northwestern Bee-Keepers' Association will meet in Chicago, on Tuesday and Wednesday, October 25 and 26. All bee-keepers are cordially invited to attend. It is desired to make this one of the most interesting conventions ever held in the United States. C. C. MILLER, M. D., Pres. C. C. COFFINBERRY, Sec.

The Northern Michigan Bee-Keepers' Association will hold its fourth Annual Convention at Maple Rapids, Clin and 12, tSs1. Clinton Co., Mich., Oct. Ssl. O.R. Goodno. Sec.

The National Bee-Keepers' The National Bee-Keepers' Convention meets on Wednesday, Thursday and Friday, Oct. 5, 6 and 7. Delegates to the Convention can get exentsion rates to the Louisville Exposition, Cincinnati Exposition, St. Louis Fair, and to the great Cotton Exposition, at Atlanta, Ga.

N. P. ALLEN, Pres.

Well Pleased with the Honey Crop.— Bees are doing finely, getting a good crop of pure white honey. I have had from 3 to 4 swarms from each colony. Those that have swarmed 4 times have recruited up, and are at work in have recruited up, and are at work in the boxes. Bees are now at work on buckwheat in the early part of the day, and later they get to work on white clover, which is plenty yet. I am the only one in this part that has any honey to sell. I sell all my honey at home at a good price, and cannot half supply the demand. My bees have wintered without loss, but I lost a few colonies early in May by few colonies early in May by ing and robbers. With everylost a few colonics varieties dwindling and robbers. With everyone else, I say, success to the BEE LUCAS. Kirkland, Ill., July 26, 1881.

To Oneen Breeders.-1 wish some of To Queen Breeders.—I wish some of our extensive queen breeders would give through the BEE JOURNAL, a description of the most suitable size for making nuclei. I have the Langstroth hive, and wish to make some boxes for nuclei, but do not know the best size. SAMUEL COULTHARD. Preston, O., July 2t, 1881.

Large Honey (rop of Best Quality.— Basswood has not given us a pound of honey this year, yet the season has been very favorable until a week or My 108 colonies have given two ago. me an average, so far, of 70 pounds each, nearly all white clover, extracted, and the best quality I have ever obtained. O. O. POPPLETON. Williamstown, Iowa, July 21, 1881.

Light Crop.—The honey season closed about July 10. The crop has been light, owing to unfavorable weather during nearly all of the white clover barvest. The basswood season was extremely "short and sweet." II. R. BOARDMAN.
East Townsend, O., July 25, 1881.

Much Pleased.—I am much pleased with the Weekly BEE JOURNAL. Its value has greatly increased, and it is now indispensable. To go back to a monthly now would be almost like throwing away the Langstroth hives and going back to the old "bee gums." Spring Hill, Tenn. J. M. Davis.

Locality for Honey, Crop, e'c.—The Veckly BEE JOURNAL is the "right hing at the right time," I have fre-Weckly BEE JOURNAL thing at the right time. weekly bee Journal is the light thing at the right time." I have fre-quently, this summer, had my ques-tions answered, when in doubt, by the timely arrival of the Bee Jour-Nal. The monthlies are all right (1) wish I could take and read them all, but that is impossible with ne), but the Weekly just "fills the bill," for me, especially. When the Monthly Bee Journal formerly came to hand I could hardly spare time to read all of it, and it would lie around some-times until another came, before I could more than glance through it; but I read the Weekly. I am increas-ing slowly, trying only to fill my combs, and am only working 2 colonies for sur-plus, and must say I think it a very plus, and must say I think it a very poor year for bees. We have had no poor year for bees. We have had no clover honey, to speak of, and now basswood is half gone, with a poor prospect for the rest. We have had a very few warm days and plenty of warm nights, and rain most of the time. The farmers ought to be happy, but bee-keepers will fall short of their bright anticipations for the summer's work, except in a few localities. Mr. Doolittle "hits the mill on the head" as to the season and queen-rearing. I never had such hard work to rear the few queens I want. So far as a locality for honey is concerned, this is ocality for honey is concerned, this is as good as any in the State; from re-ports, I notice that when there is honey to be had, I get my share. It is pretty well stocked, however, and I can get no price in the home market, if so, will it break out again?

except what little can be retailed. except what little can be retailed. Dealers want to pay 12½ cents, and seil for 20. There are, or have been (they may be out of business now), a few that bring in honey, and, by selling it low, spoil the market. I have seen nice white honey sold at 7 cents, and one man told me that he sold here at 16, but I have never been able to do so and my honey has been the heaf at 16, but I have never been able to do so, and my honey has been the best and in the best shape. Before I sell more honey I must solve the oft-propounded problem—how to market the crop? I should have had no trouble if a prominent supply dealer had filled my order on time and correctly, for crates, as I should have sent it to your city, but the crates I well a present did not city, but the crates 1 ordered did not come as soon as I wanted them, and got them they were too small and had to be enlarged so go them. got them they were too small and had to be enlarged, so, as the winter was rushing on so rapidly, I shipped to New York, just getting it through by Nov. 1., when winter began. I received returns on 15 of it about May 6, and the rest is on hand yet.

S. E. Tubbs.

Auburn, N. Y., July 18, 1881.

Poor Season for Honey .- This is decidedly the poorest season for honey yet, with me. Too cold and wet for decidedly the poorest season for honey yet, with me. Too cold and wet for white clover to secrete, and basswood yielded, only a part of one day. I have 135 colonies, and the most of them extra strong in numbers. I think the weather too cold for the basswood. Unless the yield is better other places, honey will be worth 30 cents.

A. A. HARRISON.

McLane, Pa., July 23, 1881.

Poor Honey Yield .- The first harover and it has not been ble. We had an abundant very favorable. We had an abundant yield of locust, but it was cut short by yield of locust, but it was cut short by unfavorable weather. June was cold and wet, and the abundant yield of white clover contained but a small amount of honey. Basswood has come and gone, but did not amount to anything. May swarms were all hived on empty combs and comb hived on empty combs and comb foundation, and yet I have not received a pound of surplus from the whole. I commenced the spring campaign with 41 colonies, and have obtained only 440 one-pound sections, consisting largely of locust honey.

(C. H. Fronce.

Erie, Pa., July 25, 1881.

Late Fall Breeding, etc.—1 put 35 colonies in winter quarters Nov. 15th, 1880, packed in straw, which remained until March 7, 1881, when they had their first flight. At that time all answered to roll-call but 5, which died of dysentery. Most of them were in fair condition. Again they had flights on the 9th, 10th, 15th and 16th, but during that time the brees died very fast, the that time the bees died very fast, the bottom-boards being covered every few days. For about a month the weather remained cold, so the bees had no chance to fly, and on examining them again I found all dead but 15. Some of these were too weak to survive, and I united 4 of them with others, and 3 swarmed out and united with some of their neighbors. When they began to carry pollen, on April 23d, I had S, and all were weak but 3. Some of them could only cover a patch of brood the size of my hand, on one comb. I have now 19 in good condition, and have two that will cast their tion, and have two that will cast their lists swarms in a few days, and I to cast its after swarms. In the October number of the BEE JOURNAL, 1880, page 475, I gave a description of my bees, asking you if it was a case of fond brood. They were then batching their last brood for the season, and I found little patches of dead sealed brood in several of the hives after the rest had all hatched. This spring, when the brood began to hatch, I still found a little dead scaled brood, but found a little dead scaled brood, but none dead unsealed. As soon as they began to carry in fresh honey and pollen, their dead brood disappeared. think my loss was from the bees not breeding late enough in the fall. I would like to ask:

1. Is this a case of foul brood, and

2. How late should the last brood hatch in the fall?

3. Give the best way to feed, without feeders, to promote late breeding, and how late should honey be fed in the fall.

4. What quantity will 20 colonies re-

quire daily to promote breeding.
5. With hives in boxes well packed in straw or chaff, will it do to leave the caps off during the winter if chaff cushions are placed on top of the frames and straw above the cushions?

L. A. BURKHOLDER. Hamilton, Ont., July 16, 1881.

[1. Had it been a case of foul brood, there would probably have been a recurrence of it this season; again, with the contagion usually known as foul brood there is always an accompanying fætid or putrid stench, which is said to be unmistakable. The larvae becomes stuck or glined to the bottom of the cell, and is rotten and ropy, so the bees cannot remove it. Yours was undoubtedly a case of brood killed by chilling. What it might lead to, in case there was much of it in the hive and the colony quite weak, or the weather cool and "muggy," we are unable to say. It has been a subject of much interesting discussion in the pages of the BEE JOURNAL.

2. The last brood should hatch in season to give the young bees at least one good flight before being shut in

for winter.

3. For late breeding, outside feeding is undoubtedly best. Mix your honey with hot water to thoroughly liquify it, in the proportion of two parts of honey to one of water, or even a little more of water. Put this in broad, shallow vessels, and place in an open shed, where the bees will be obliged to lose sight of the hives in order to reach it. Never place the honey in the apiary, in sight of the hives, as it will invariably incite the bees to robbing. A few shavings or a little hay put in the vessels, will prevent drowning or daubing. Feed until you have the desired number of young bees in the larval state.

4. Five to ten pounds per day. Feed, after the fourth day, only as much as the young bees will consume.

5. Yes; provided there is no outside escape for the heat.—Ed.]

The Wintering Problem not Solved. The Wintering Problem not Solved.—Time, with his sickle, is mowing the days and bours. Seasons come and go; days and months, like the seasons, succeed each other. Summer, with all the joyous anticipations that could be produced by the warm and genial rays of the sun and change of the season, will soon give place to autumn, and this to cold, bleak winter. Thus, time is fast moving us on, and soon the little busy bees will be quieted in their domicils to feast upon their hard-earned provisions, anxiously a waiting earned provisions, anxiously awaiting the coming of spring. The practical aparist will watch their needs and adapparist will watch their needs and administer to their wants. If stores are wanting, provide them; should the queen show signs of unfruitfulness, give them another. They should have plenty of good honey, and a sufficient quantity of bees to generate heat necssary for the welfare of the colony. essary for the wehare of the colony. I am not so positive as some of our wise apiarists, that it is necessary to have all young bees for successful wintering. Forty years ago such a thing was not talked of, and then bees the successful winter the successful with the wintered well without much loss. wincreu wen without much loss. The great anxiety now is about the bees dying in winter. Almost every renedy that can possibly be thought of has been prescribed through the bee periodiculs; these prescriptions are not few in number, and many of them are worthless. Some bee-keeper boys. are worthless. Some bee-keepers have among the best in the spring.—ED.]

resorted to carpets, cushions, chaff hives, sawdust, and other materials, and still they die. For thousands of years, these poor little creatures in-habited the hollow trees and the crev-ices in the rocks, and down to a more modern period, salt barrels, nail kegs and box hives, and many of them very poor and open at that, yet bees win-

We must do something in experimenting, to see if the cause exists in the food, or cold and confinement. 1 will send to each of the editors of the box hive, you can put it out of doors, elevated on ½-inch blocks, and let it flicker.

A. F. Moon.

Rome, Ga., July 20, 1881.

Fertilization.—The failure of so many experiments in the fertilization of queens in confinement is, I think, on account of a misunderstanding of the modus operandi. The queen is not fertilized on the wing, as so many as-sert, but after being pursued by the drone, and overtaken, they settle on the nearest object. Then, while the queen suspends herself by one leg, she is fertilized. Had Mr. Demaree known this, he might have succeeded in his experiments as reported in the REE on account of a misunderstanding of experiments, as reported in the BEE

JOURNAL for Jan. 5, 1881. E. I. Bussey. Shellrock, Iowa, July 23, 1881.

The Rev. L. L. Langstroth's Letter.—How quick the BEEJOURNAL comes to hand this week—on Wednesday afternoon—two or three hundred miles away! I read with interest the Rev. L. L. Langstroth's letter to A. I. Root, and two things are new to me: The wide space between the combs, and the space above the frames. I hope he will be able before long to give us best thoughts on preparing for winter, for there are many readers of the BEE JOURNAL who are, like my-self, novices in bee literature as well self, novices in bee literature as well as in bee-keeping. I left my bees last winter in charge of an old bee-keeper, who very often was at work on them digging away the ice that formed at the entrance. This disturbance, of course, was very bad for them last winter. How to avoid this ice formation, or to have it not interfere with the entrance is the cuestion. We have the entrance, is the question. My bees had quilts filled with wool above and on the frames, and bags of chaff above My bees those, with the summer entrance open. Nearly all died in April—a few sick ones left. I have thought of cutting ont the bottom 4 inches (or length of entrance) by 2 inches inside the hive, and fitting on below the board a strip for drainage. Should I save the ice from the entrance? Do you think without a honey-board, only quilts or chaff, bees would smother if the entrance was filled up? If not asking too much, sometime when there is room, please give us some thoughts on this.

MARY E. ROGERS.

Flint, Mich.

I Your scheme for diverting the water from the entrance, and thus preventing its obstruction with ice, we think is feasible. Or grooves might be cut along the bottom-board, and outlets prepared for the water independent of the entrance. Unless the vapor should permeate and solidly congeal in the cushion above the bees, so as to make the brood-chamber airtight, we do not imagine it would be possible for the bees to smother. With an upper ventilation, but little lower ventilation is necessary. Last winter, the hive of one colony in the BEE JOURNAL apiary not only had the entrance entirely closed with ice, but the ice was more than an inch deep in the bottom, completely imbedding the lower portion of the combs. The upper story of the hive was half-filled with chopped straw. This colony was

### SPECIAL NOTICES.

Single copies of the JOURNAL sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

When changing a postoffice address, mention the old as well as the new address.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Photographs of prominent Apiarists—Langstroth, Dzierzon, and the baron of Berlepsch.—Price 25 cents each. . . . . . .

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

The Beauty and Color of the hair may be safely regained by using Par-ker's Hair Balsam, which is much ad-mired for its perfume, cleanliness, and dandruff eradicating properties. 31w4

Nearly all the ills that Afflict Mankind can be prevented and cured keeping the stomach, liver and b neys in perfect working order. There is no medicine known that will do this as quickly and surely, without inter-fering with your duties, as Parker's Ginger Tonic. See advertisement.

### Apis Dorsata, the Large Bee of Java.

W. Z. HUTCHINSON.

The following is an extract which I have copied from a recent number of The Youth's Companion. Anything in regard to Apis dorsala seems to be of

regard to Apis dorsala seems to be of interest just now. Here is the extract:

In the year 1857 1 was mate of the ship "Ellen Bird," then making her third voyage. It was in the palmy days of the sandal-wood and beeswax trade, and we were at the Island of Timor, anchored at Delhi haven, taking in a cargo.

ing in a cargo.
While slowly taking in sandal-wood, log by log, I, as mate of the vessel, was dispatched on a trip inland, to hasten the collection of beeswax.

Much has been said and written concerning bees, but I think the reader

concerning bees, but I think the reader will yet find something novel in a brief description of the wild bees of Timor, and the odd method by which the natives capture them.

These bees (the Apis dorsata) do not, like the wild bees of America and other countries, build their nests in hollow trees, or clefts in the crags. I was astonished to see hanging to the lower side of some stout branch, far up in the top of the loftiest trees, a great cone of honey comb, often 4 feet in diameter by 5 feet in length. These combs are so piled and covered in as to resist the weather completely, and to resist the weather completely, and are cemented to the branch with a are cemented to the branch with a thick, glutenous stump of very tough and compact wax. I estimated the weight of some of these large combs at 300 pounds.

During the week we were in the forest, we took, I should think, nearly 500 of these honey cones. The honey,

save what we could eat with our food. was no use to us, and I have little doubt that thirty or forty thousand pounds of honey was destroyed by us in that one week, for the wax was all

that we cared to take.

The first time I saw the natives take a bees' nest I thought their method of doing it as peculiar as the nest itself was odd. This particular nest hung from a limb of a tall, straight, smoothbarked eucalyptus tree, 75 feet from the ground. The trunk was a yard or more in diameter. To cut it down would have been several hours' work, even for an experienced woodsman, while to climb it, after the ordinary fashion, would have been out of the question. This is the way Benn, one of the Timor men, set to work. First, he took from his bundle a torch of some resinous wood, and lighted it. This torch he attached to his waist-This torch he attached to his waist-cloth, or girdle, by means of a string some 10 feet long, so that as he climbed up, the slowly burning, but densely smoking torch would hang beneath him. To this girdle was also hung a chopping knife, for cutting off the comb from the branch, and a long line in a coil, for lowering it to the ground. Fola, another of the men, now brought him a strong bush rope, or creeper, some 20 feet long, green and pliable, and freshly cut from the thicket. Benn first passed one end of this creeper around the trunk of the tree, then, grasping an end of it in each then, grasping an end of it in each hand, leaned back, and setting his feet hand, leaned back, and setting his feet against the trunk, he begant to walk up the tree, holding fast by the brush rope, and throwing it up, by a quick jerk, after every second step. It was wonderful to note the skill with which he took advantage of the least roughness or scar in the bark, to get a hold for the loop, or for his feet. He was no more than a minute going up 60 feet. All this time he was almost enveloped All this time he was almost enveloped. All this time he was almost enveloped. an time ne was almost enveloped in a cloud of smoke from the torch, which seemed to prevent the bees from settling on his body, which, but for his waist-cloth, was entirely bare and exposed to their stings. Arriving directly beneath the limb to which the comb was suspended, by a dexterous spring he threw himself partly over it, then drawing up his torch so that the smoke completely enveloped his body, he rested for some moments before creeping out on the branch to cut off the combs. Thousands of bees were flying about him, and thousands more were clinging in black masses to the outside of the comb. But upon Benn's holding out the torch beneath them, they all rose in a dense cloud, filling the forest with their deep solemn hum. Defended by the smoke, Benn had in a moment or two made a double noose of his smaller line around the comb. comb was suspended, by a dexterous a moment or two made a double noose of his smaller line around the comb, and then, with a few deft cuts of his chopper, he cleaved off the cone from the limb, and lowered it unbroken to the ground. In 3 minutes more he walked down the tree, much as he had walked up, and stood among us, none the worse for his exploit, with the exception of a few stings. Afterwards I repeatedly saw Fola, Amme, Motuleet, and a dozen others of our native repeatedly saw roll, Almie, Motteleet, and a dozen others of our native squad, climb up for nests in the same way. It was their customary method. Rogersville, Mich.

For the American Bee Journal.

#### How to get rid of Fertile Workers.

E. A. THOMAS.

Fortunate it is for bee-keepers that the fertile worker is of rare occurrence, and can only occur in a colony in an abnormal condition. No one should allow a colony to remain queen-less or without the means to rear one from, a single day, and whoever does will lay himself liable to a new chapwill lay himself liable to a new chapter of experience in bee-culture. I believe the old adage, "an ounce of prevention is worth a pound of cure," holds good in this case, and if the apiarist will take proper care of his bees he will have but little trouble with fertile workers. But the most careful bee-keeper will sometimes have a case, especially if he has a large number of colonies to care for, and how to get rid of the workers has doubtless puzzled many.

I think there is a difference in colonies, for, while some will readily accept the means of obtaining a queen, others seem bent on their own destruction, and nothing can be done with

others seem bent on their own destruction, and nothing can be done with them until the fertile worker is removed. I have never had a full colony with a fertile worker, but now and then have a nucleus colony, which loses their first queen in going out to meet the drone, and so has no means of supplying the loss. After having experimented some as to the best way of getting the worker out of the colony I have concluded that the treatment given below is the only sure way to deal with "tough cases" that refuse to receive a queen or raise one.

to deal with "tough cases" that refuse to receive a queen or raise one.

I have had 2 nuclei troubled with fertile workers, one of which readily accepted a queen-cell, and, in course of time, had a fine laying queen. But the other would not accept a queen or start any cells from brood given them. I repeatedly inserted cells which the bees would take care of until hatched and then kill. This seemed to be a case where the bees had accepted a worker for their queen, and regarded all greens a particular.

all queens as intruders. I had about concluded to subject then to the treatment given below, when, by accident, I discovered a worker in the act of laying. I watched her while she laid quite a number of eggs, the bees treating her with all the consideration they would a green and then I winched her head. a queen, and then I pinched her head.

I had always thought that there was only one fertile worker in a colony, and I now had an opportunity to test the matter. In a short time after I killed this worker the bees manifested all the circus of awardscaped and I. all the signs of queenlessness, and I immediately gave them some eggs and larvæ, when they became quiet and soon had cells started. I then gave them a cell from a full colony, as I rear no queens from nucleus cells, and in the time they had a laring agree.

the old stand. In the morning the bees will commence to go back to the old stand, and after a sufficient numond stand, and after a sunneight fulli-ber have returned, give them a queen-cell and brood in all stages. The bees in a colony having a fertile worker are, of course, nearly all old bees, and so will nearly all return to the old stand. The fertile worker and a few bees will remain, which can be destroyed, or they can be united with the col-

ony after the queen is established.

This manner of treatment reminds and of a very sure way to introduce queens. Remove the hive to a new stand and place a hive containing a frame or two of brood on the old stand. After all the old bees have returned to the old stand, introduce the capear to the young bees left in the the queen to the young bees left in the hive, and after she has commenced to live, and after she has commenced to lay take the hive off the old stand and return the old hive containing the queen. The old bees will return gradually, but so few returning at a time, and they finding the queen so quiet on the combs, do not offer to touch her. This is the way I introduce imported queens, and all those that I do not wish to run any risk on.

Coleraine, Mass.

For the American Bee Journal.

#### Rocky Mountain Bee Plant.

R. W. KEENE, M. D.

DEAR EDITOR: Will you, or some of your correspondents, give me some information as to the best manner of raising the Rocky Mountain bee plant—when and how to sow it, etc.? I sowed some of it in drills in my garsowed some of it in drills in my garden in the spring of 1880, and it did not come up until last spring, and then only about 30 plants. From what I have seen of these few plants it beats anything for bee pasturage—the bees are on it from daylight until noon, and while everything else is parched with drouth it is flourishing. My bees have been working on it 5 weeks—if I had one or two acres of it now I would enjoy it, and I know my bees would. I also have a few plants of sweet clover also have a few plants of sweet clover that have been in bloom a month, but that have been in bloom a month, but there has not been one bee on it yet. I had intended to sow several acres of the latter this fall, but I am afraid it will not produce honey here. What do you think of it? Give me your advice. My bees have done well, for a beginner. I have taken 1,800 pounds of honey from 19 colonies in the spring, and made 26 new colonies. I lost 6 left winter. I have the simplicity confidence.

and made 26 new colonies. I lost 6 last winter. I use the simplicity chaff hive, with chaff pillow over the brood-less, it is a colonies. hive, with chaff pillow over the brood-chamber. I commenced with 3 colo-nies in the spring of 1879, and now have 45 good colonies, all in chaff hives. I have succeeded well in every-thing, except in preventing my colo-nies, run for section honey, from swarming. I have averaged 60 one-pound sections to 9 hives, which I con-sider a failure in box honey, for, if I could have prevented swarming. I rear no queens from nucleus cells, and in due time they had a laying queen.

If anyone should find a fertile worker in a colony let him try the following treatment: Shake the bees from all but one or two combs during the day, and at night, when the bees are quiet, remove the hive to a new stand, and put a new hive with the combs taken from the old colony, on

at home. I hope to see you at the National Convention, at Lexington. Versailles, Ky., July 29, 1881. at home.

(Sow Rocky Mountain bee plant (Cleome) seed in the fall, either in drills or broadcast; drill 30 inches apart, with plants every 6 inches, or 6 pounds per acre broadcast, harrowing it in nicely. It is biennial, blooming the second year after planting, and continues reproductive. We fear you have hardly given sweet clover (Melilotus alba) a fair trial. Sow one acre this fall, harrowing it in nicely; in the spring sow 12 pound mammoth mignonette, to give bloom the first season, as sweet clover is also a biennial. We think, all things considered, it has no equal.—Ep.1

#### The Honey Crop.

O. CLUTE.

The white clover is over and gone. and we may look at the result as to crop thus far in the season. Bees generally were weak when, about the middle of April, spring opened. A few bees in a hive, many moldy combs, little courage either among bees or bee-keepers,—such was the combs, little conrage either among bees or bee-keepers,—such was the condition of things. But when spring came, it came all at once. Very warm weather brought forward the early flowers as if by magic. No sooner could the bees fly out than they found both, but by magic and better. sooner could the bees fly out than they found both pollen and honey. The most marvelous change was at once wrought in the hives that the bard winter had spared. The good queens began to lay rapidly. There was abundance of food for the growing brood, and it came on apace. The long, warm days were musical with the merry humming. Willows, elms. maples, cottonwoods, box elders, apples, and the small fruits, especially ples, and the small fruits, especially the raspberries,—all yielded honey or

or both.

With such favorable weather, and such a good supply of food, the few colonies that were alive when spring colonies that were alive when spring opened increased in bees with unusual rapidity. Yet it is doubtful if they were as strong as colonies ought to be when white clover began to open. Their winter depletion could not be so easily overcome. Soon after white clover opened we began to have rains, which washed out the honey from the flowers, and prevented the bees from flying. In some sections rains were so prevalent during Linn bloom that so prevalent during Linn bloom that but little was obtained from that source, which usually gives such an

abundant vield.

But the white clover has been quite abundant, and the rains somewhat prolonged the season, so that in spite of some weakness in the hives and the drawback of the heavy rains, a very fair harvest has been secured. We fair harvest has been secured. We have hives that have given 80 pounds of surplus honey, in addition to furnishing the bees for making two swarms. But not all our bees have done so well. Moreover, our bees have had but little comb to build, for at the opening of the surplus honey season, we put on the second stories, filled either with frames of nice old filled either with frames of nice old comb, or with foundation. This gave the bees a great advantage. The time the bees a great advantage. The time and honey they would otherwise have devoted to comb building they were able to give to nursing the growing

able to give to nursing the growing brood and gathering honey.

On the whole, the honey crop thus far has been fair in the vicinity of Iowa City. We see reports which indicate a fair yield generally. In some sections the yield has been rather above the average. As the rains have been so abundant we may expect a luxuriant fall bloom, and a pretty good yield of honey from it. Should these expectations be realized, the present season, since the middle of April, will expectations be Paniza, the present season, since the middle of April, will have been one of prosperity for the bec-keeper who was so fortunate as to bring his bees through the terrible winter.—Iowa City Stock Journal. For the American Bee Journal.

#### Method of Obtaining Comb Honey.

G. M. DOOLITTLE.

"The best method of obtaining comb honey" has been sent me, with a request that I use it as a text upon which to write an article for the BEE

The first and qualest necessity, is plenty of bees. While a few bees can be made to work in the honey receptas to some extent if rightly managed, still success, as a rule, is rarely at-tained unless the hive is well crowded with bees.

Plenty of bees are of no advantage unless we have them at the right time for if they are only obtained at the end of the honey harvest, they become of the honey harvest, they become consumers instead of producers, there-by thwarting the object we have in view. If the harvest is white clover, we must build the bees up strong, early; if basswood, a little more time can be taken; if buckwheat and fall flowers, the bees will usually become strong enough, if allowed to take their own course. As white clover is the main honey crop with the majority, the bees should be stimulated during the month of May by feeding, spreading the bees should be stimulated than the month of the spreading the best of the spread of the structure of the structure of the spread of

the month of May by feeding, spreading the brood, etc., so as to early obtain all the bees possible.

The next thing is to know just when to put on the boxes, or surplus arrangement. This is something quite difficult to decide, for if put on too early, brood-rearing is retarded, and if put on too late, much loss of honey will be the result. I have found it the best plan to wait about putting on boxes until 1 see little bits of comb being built at the ends of the frames and next the honey-board, with honey benext the honey-board, with honey being put in them. When this is observable, you may know that honey is to be had, and that more room is needed. be had, and that more room is needed. Do not wait until your bees swarm before putting on boxes, for bees offen refuse to swarm, and hang idle on the hive all summer. Swarming is retarded very little, if any, by putting on boxes, and if a start is made in them before swarming, they are entered much quicker when the hive gats nounlous again from the hatch. gets populous again, from the hatching of the brood.

Another important item, is not to put on too much surplus room at first. Put on a capacity of from 10 to 20 lbs. according to strength of colony, and when the bees are well at work in this, add more by spreading apart those they are at work in, and putting empty they are at work in, and putting empty boxes between those partially full, till the full capacity of the hive is reached. From many experiments, I have become convinced that surplus room to the amount of 60 pounds is about right for a good strong colony, where worked for box honey, and 120 lbs, where for box honey, and 120 lbs. where worked for extracted honey, exclusive of the brood frames. In putting on boxes I have found it

a great help to have a few boxes full of comb, left over from the previous season, to place on at first, as the bees will store honey in these before they will build new comb or draw out comb foundation.

If you adopt the tiering-up plan, raise up those put on first, when two-thirds full, and put an empty tier under them; and when they are two-thirds full, raise them again. Do not keep tiering up, however, toward the close of the honey season; but as it draws near, reverse the operation, so as to have the bees finish as many as possible of those they have started in.

This tiering-up process is preferred by many of our best apiarists; but I prefer the side and top-storing plan combined, and fully believe that better results can be obtained by its adoption. In this case put on boxes as be-fore till the top of the hive is covered. and when more room is needed, put on those at the sides. For this plan, cases and separators for holding the section boxes are a necessity. These should hold the number of boxes most and when more room is needed, put on those at the sides. For this plan, cases and separators for holding the section boxes are a necessity. These should hold the number of boxes most convenient for the hive in use. I use a case holding two prize boxes. As soon as those first put on are capped preparing for shipment the bees I had

generally handle them by the cases instead of by the separate box. Keep on taking from the top, and placing empty boxes with starters at the sides, empty boxes with starters at the sides, till the season draws to a close. Now, instead of placing more boxes at the sides, close up the sides with your follower, as you raise the parily-tilled boxes, till the bees are shut out of the side boxes entirely. By this means you throw the full force of the bees on the few remaining boxes, which are partly filled, so most of them are finished up at the end of the season. I take off all finished boxes once a week, and consider this none too often to take

and consider this none too often to take off the honey, for by so doing it is not soiled by the bees traveling over it.

Thus, I have told you, in short, just how I manage my bees for box honey.

One writer thinks that to move see itself for the story is too. One writer thinks that to move sections from the side to the top is too much work, and says that "the operation looks easier on paper than he finds it to be in reality;" and another writer wants me to give an "article whose points are based upon reason, and not mon my personal experience." When nyon ny personal experience." When I write I give things as I find them, and methods as I use them, and not high-sounding theory, to tickle the ears. If any do not see fit to work as I do, let them work as they choose—this is a free country. this is a free country. Borodino, N. Y.

For the American Bee Journal.

#### Another Letter from Frank Benton.

FRANK BENTON.

By the courtesy of Mr. D. A. Jones. of Beeton, Ontario, we are able to present to our readers another interesting letter from Mr. Frank Benton :

FRIEND JONES: They have me behind bars and locks, with plenty of guards about! I am not alone in my misery for, among the 30 other passengers, is Mrs. Fluhart, who came on the same Austrian Lloyd steamer, having been on a journey to Palestine the same Austrian Lloyd steamer, having been on a journey to Palestine. What are we charged with? Why, we touched the Syrian coast, and quarantouched the Syrian coast, and quarantine has been established here, since a few cases of the terrible disease known as the "black plague" have been reported from Mesopotamia (Bagdad) a thousand miles from Beyrout, or fully 40 days journey from any port of the Syrian coast. We have but 3 days to Syrian coast. We have but 3 days to stay, and get along very well since tood is daily brought us from our friends outside. After not having seen my wife for over 5 months, I am now permitted to speak to her through a small window, she remaining at a distance, and I have not shaken hands with her yet. We have had visits from the ladies of the American school, and many of the pupils, also, but they are "distant calls."

1 brought with me, from Syria, a lot of bees, from Mt. Lebanon, and they are also in quarantine (that is, nights, for I have "stolen a march" upon the officers; assoon as the hives had been ranged in the shade of a wall, I opened the entrances. To-day

had been ranged in the shade of a wall, I opened the entrances. To-day one colony swarmed, and the swarm clustered on a tree in the outer inclosure of the quarantine. Everyone outside of our part, not being quarantined, left; but by permission of the physician in charge, I went out and hived them. As things can be passed in for us, I sent home for empty bee hives, and have been transferring! I have had about 30 spectators inside, and those having come to see friends, by climbing up outside, could look by climbing up outside, could look over our walls.

over oil watts.

My letter, mailed at Suez, probably prepares you for the statement that I

over, they are taken off, and those partly filled at the sides are raised to the top, in place of those taken off, and the empty boxes placed at the sides every time. In doing this, I generally handle them by the cases instead of by the separate box. Keen ties, rendered it impossible to remedy the matter. When on the Red Sea we experienced a very sudden change of temperature, from the hot breezes of the deserts to, what seemed to us, a cold northern blast, and I found my-self again down with the fever. Most of the passengers suffered, and many who were strong and well before be-came suddenly ill, not from seasick-ness, however, for the sea was not rough.

At Suez 1 was too weak to go on At Suez 1 was too weak to go on shore, so as to come by rail to Alexandria, and avoid, thereby, any quarantine here, hence I went on to Port Said, but could get no steamer for Alexandria for some days, although I could get one for Beyront the same day. I chose the latter route, since I thought I might have to wait several days in Meyandria also if I did not days in Alexandria also, if 1 did not connect with the English steamer from there; then, too, I supposed I would be sure of an English steamer each week from Beyrout to Larnaca, but upon my arrival in Beyrout I found.

upon my arrival in Beyrout I found, to my surprise, that this line had discontinued for the present sending any steamers from Beyrout to Cyprus, and I must wait some time for the Austrian Lloyd for Larnaca.

As soon as I gained a little strength in the bracing air coming down from Mount Lebanon, with its snow-crowned peaks. I went out in search of bees. Some of the colonies I bought were obtained of a man you bought from last year. These I brought in a boat to Beyrout, thinking they would from last year. These I brought in a boat to Beyrout, thinking they would arrive in better condition, but it was very trying to see those stupid men (Arabs and Turks) persist, after repeated caution and when I carried a jug of them myself to show them how, in turning them all ways but the right one. After many delays, much talk, and no small number of lies on the part of the officials at the customhouse, as well as some bucksheesh, I got the colonies on the steamer, and now they are here, and, strange to say, now they are here, and, strange to say, a few escaped with whole combs.

If anyone thinks that it is an easy matter to buy up, prepare, and transport bees from these lands to our far western home, he would need but one such trip as my last to convince him to the contrary.

As to the great East Indian bees (Apis dorsata) I can say they were alive when I reached Beyrout, but seemed to have withstood a trying seemed to have withstood a trying journey, so that, when I let them out, they dwindled. I could not prevent it, and at last there were no more left. It would have been interesting to have It would have been interesting to have experimented with these bees, but I doubt greatly their excelling, if they equaled, Apis mellifica. I have still some bees of the species Apis florca, and at least one queen is alive. These are very small bees, and not of much value. One thing very much surprised me, namely, the wonderful tenacity of life the 2 races just mentioned have shown. Under the same conditions Apis mellifica would, I believe, scarcely have reached alive \( \frac{1}{2} \) of this long journey of 6,000 miles from Ceylon.

#### LATER-OUT OF QUARANTINE.

We are busy getting things tixed up; keeping house in the old mansion, but could only get the promise of it for one mouth, since the owner thinks some of coming to Larnaca to live. You know it is owned in Nicosia.

I found the bees in fine order, with some increase. My dear wife has done wonderfully well with them; she has hived all the swarms, etc., given them empty combs, and has smoked

has hived all the swarms, etc., given them empty combs, and has smoked the surplus combs with sulphur, so they are in good order, and I will soon have them covered with bees.

Those "pesky" Greeks said: "That American has now gone, and we hope steps will be taken to prevent his returning to our Island and sending away the few bees left in Cyprus." But there is no fear, for our work here has interested those who, by reason has interested those who, by reason of their positions, could counteract any petitions sent to the Government.

FRANK BENTON.

Read before the Lewisburg (N. Y.) Scientific Soc.

#### Do Bees Puncture Grapes?

PROF. F. W. TUSTIN.

The question as to whether the honey bee, Apis mellifica, punctures and tears open the skin of fruit, and especially that of the grape, has called forth considerable discussion. That a matter apparently so simple should, for so long a time, be in an unsettled condition, seems a little surprising.

Bee-keepers generally deny that bees do any injury to sound fruit, and as they doubtless best understand the habits of their favorites, they make a strong argument in their own behalf.

Fruit-growers, on the other hand, earnestly elaim that bees do them great harm. They find these insects industriously engaged in sipping the juices of bursted grapes, and in their vexation over the lost fruit, and without much discrimination, they charge out much discrimination, they charge the whole work—both the rupturing of the skin, as well as the extracting of the juices-upon the busy yet harm less insect.

Here we have the chief point of interest in this question—the fruit-grower, from personal considerations, demanding that the bees shall be de-stroyed or kept within bounds;—the apiarist denying that his bees do any harm, and that therefore they should not in any way be restrained,

The subject was assigned to me to report upon before the society, at a time when I had not the opportunity of giving it any special attention, and yet in a general way I have observed for several years that bees have been very numerous about my vines, and that many a grape was robbed by them its sweet juices and rich pulp.

That bees have increased in numbers and that they are fond of feeding upon the luscious contents of a ripened bunch of grapes are well admitted facts. The food most natural mitted facts. The food most natural to the bee is the fluid secretions contained in the nectaries of various kinds of flowers, and the pollen dust of the anthers. But when flowers are scarce, or when they have passed their season—since the bee must live and gather honey all the day—its in-stinct leads it to other saccharine substances, and on this account, doubt-less, it takes to the ripened peach, grape, pear, and the like.

The bee is furnishd with organs,

enabling it readily to gather its food. In the first place it has a double stomach, or, more correctly, two stomachs, the first of which serves as a receptathe first of which serves as a recepta-ele or pouch for the fluid matter which it gathers from the flowers; this fluid matter thus gathered and stored up does not appear to differ from honey. In this honey-stomach no digestion of the honey is known to take place, and it seems to serve the only office of holding the gathered honey, until the bee réfurns home. The coatings of this stomach being furnished with the power of muscular reaction, the honey is readily emptied into the cells of the

To extract the honey-fluid from the flowers and introduce it into this stomach, the bee is furnished with what may be regarded as an elongated tong ue formed by a prolongation of what with us answers to the lower lip. This tongue is flexible, and capable of a certain degree of extension. It is not a hollow tube with a suction arrangement at the end, to enable the bee to suck the fluid of the flower into its stomach, as has commonly been sup-posed. But in gathering honey the bee inserts its tongue into the neetary of the flower, and whatever honey may adhere to the surface of the tongue

icate organ and has no puncturing or

penetrating power.

To further enable the bee to accomplish its work the mouth is furnished with "feelers" or palpi—four in number. These are for the insect, its organs of scent. There are, besides, 2 strong mandibles or jaws, furnished with 2 teeth. These parts are not used, as in vertebrates, for masticating the food but for a variety of other ing the food, but for a variety of other purposes. For instance, sometimes the parts of the flower may be so compressed that ready access to the neetaries cannot be obtained, and it may be necessary for the bee to push apart or to cut away portions of the tloral envelopes, so as to gain the honey. And in the work of preparing a place for the building of the nest, or the making of the comb, it may be necessary to break away or to cut through hard substances. In the accomplishhard substances. In the accomplishment of these things the mandibles furnish the requisite power, while the palpi or feelers tell the bee what is to be done, and how and where to do it.

That these mandibles have, for the

size of the insect, considerable power, may be seen by considering for a mo-ment some of the genera allied to the common honey bee.

common honey bee.

Thus, instances are known where the humble bee has been shut up within the corolla of flowers, and he has cut his way through the walls of his prison. There is the so-called boring bee, which, with its mandibles, often skillfully cuts its way for a considerable distance through dry timber. Then the mason bee detables and Then the mason bee detaches and gathers together grains of sand and by the aid of a mucous secretion works these up into cells of an almost imperishable kind. So that the mandibular power of the bee family is quite conspicuous, and it is a power to be exerted according as the exigencies of the case may require.

The sting of the bee is an organ in

The sting of the bee is an organ in its structure and in its use quite different from the mandibles. It is situated in the posterior part of the body and is a finely pointed instrument with an open tube extending along its entire length. At the root of the sting is a little sac in which is eon-tained the poisonous fluid, which the bee injects through this tube into the wound which he has made. The object here is to provide the insect with ject here is to provide the insect with the necessary means of self-defense when it is exasperated or attacked, and, so far as it is known, it is only under these circumstances that the sting is used. It is strictly an organ of defense, and in no way used as a means to assist in the gathering of the food. When the sting is used it simple way the surface to which it ply punctures the surface to which it is applied, unless that surface be pow-erful enough to resist the line point of the sting. So that with reference to the question before us the opinion is generally held that, in their ravages upon grapes, if bees ever do tear open the skin, they certainly do not and cannot do this with their sting, this organ having no power to tear or cut open, but only to penetrate or punct-

open, but only to benefitate or punct-ure easily yielding substances. But it is not certainly known that the bee does ever tear open the skin of the grape. For what has been stated, its mandibular power is without doubt sufficient to enable this to be done, and that it is possible may not be doubted. But there is want of evidence that the bee ever does this.

I have never seen a bee in the act of tearing open the skin of a sound grape, although I have seen repeated instances of one, and indeed several house together. bees together, luxuriating upon the sweet juices of a Delaware or a Con-

cord. And so far as I have been able to correspond with them, I find that the authorities upon this subject quite unanimously agree that there is no evidence against the bee that it tears open the grape, although this assidu-ous little honey-worker is ready to ap-propriate the sweet substance of the grape, the peach, and kindred fruits, when once the skin has been broken from any cause, whether on account of

excess of juices in the fruit whereby the skin not being able to yield sufficiently must burst, or through the sting of the wasp or other insects.

Prof. A. Packard, of Brown University, says that though he has no evidence that they do so, yet his "impression is that bees will puncture and bite open grapes," but this impression, he says is founded simply on this the says, is founded simply on this, that he sees "no reason from the structure of the mouth why they

structure of the mouth why they could not do so."
But the observations and experiments of the Secretary of the Cincinnati Entomological Society are more to the point. He says that if you lay a ripe bunch of grapes with sound berries in front of the hive, with the entrance thereto contracted to \(^1\)4 or to \(^1\)5 of an inch, so that every bee going by of an inch, so that every bee going out or coming home will have to run over or around the bunch, you will notice that they try their very best to attack the grapes, while every berry remains intro. He found the same remains intact. He found the same true of a sound ripe Bartlette pear. After he had satisfied himself of the He found the same inability of the bee to penetrate the skin of the grape, he then punetured each berry with a pin, and in an hour or two nothing remained but the skins

and the stem.

Dr. S. S. Rathvon, editor of the Lancaster Farmer, says: "I have grown grapes (Isabellas, Clintons, Concords, Hartford Prolines, Marthas, and Delawares) upon my premises for 30 years, and yet I have never ob-served a bee cutting or tearing open any of them. From the organic structure of the mouth of the bee it is very probable that they can lacerate skins of the more delicate grapes, and the testimony from intelligent sources seems to be so strong that I do not feel like ignoring it, and yet I feel that many observations in that direction are too superficial to be entirely I have not conversed with a reliable single person who says he ever saw a bee in the act of cutting open grapes. But the grapes are found ruptured, and the bees do work upon them, and that seems to be the bulk of the testimony.

But the best authority, Prof. A. J. ook, of Lansing, Mich., says: "From Cook, of Lansing, Mieh., says: "From close observation for many years, from careful experiments seemingly crucial, and from a vast amount of testimony, I feel sure that if bees ever attacked sound grapes it is exever attacked sound grapes it is exceptional; some scientists say that they do at times—so that I cannot say they do not. But I am sure it is very rarely, if ever, the case. I have lived for several years in the midst of vineyards, and where bees were very numerous, but I never saw bees tear open a sound grape. If bird or wasp or disease break the grapes, and the bees find no other stores, they will lan bees find no other stores, they will lap up the oozing juice. At such time I have broken grapes, and when they were being supped by bees, I would remove them and place sound grapes in their stead, when the bees would at once stop work."

Our conclusions from observations. and from the testimony of others are

then—

1. That the bee cannot puneture the skin of the grape with either its tongue or its sting.

2. That it is possible that bees may tear open grapes from the fact that they proceed the processor was all plants. they possess the necessary mandibular

power.

3. We believe that they rarely, if 3. We believe that they necess, a ever, do this, and that their depredations upon grapes are confined to cases where already from other causes the

skin has been ruptured. The complaints of bees destroying grapes and other kinds of fruit are grapes and other kinds of fruit are more frequent than they were 30 years ago, and possibly for the reason that in later times the trees and shrubs and plants from which bees have been and plants from which bees have been in the habit of gathering their honey have been relatively decreasing in number, while at the same time the culture of bees has been increasing all over the country. The remedy for such complaints should be found not in destroying the bees, nor in advocating their restriction, for honey we must have and it is quite as desirable.

to many persons as is fruit. The true way will be for the bee-keeper to provide, in places conveniently near the hives, the necessary clover and flower-bearing plants from which his bees may derive their food. Imbued with its instinct of indus-

try, the bee will not be idle. It will gather its stores from flowers if it can; from various fruits, peaches, can; from various fruits, peaches, grapes and pears, if it must.

For the American Bee Journal.

#### Improvement of the Race of Bees.

REV. E. L. BRIGGS.

DEAR EDITOR: Some years ago I addressed an article to the BEE JOUR-NAL, proposing a plan to improve the Italian race of bees, just as we have improved our races of hogs, cattle, and horses. And I am extremely glad to see your correspondents falling in with this proposition, and advocating the plan as not only possible, but one the plan as not only possible, but one which ought to go into immediate effect. Therefore, in order to inaugurate the work, I propose the following prize for the best tested Italian queen, to be exhibited at Wilton Junction, Iowa, Tuesday, Sept. 20, 1881, at 2 p. m. Major Allen, A. N. VanCamp and Mr. Picket, of this county, being the indges in the case to award the the judges in the case to award the prize. These 3 gentlemen are all practical bee-keepers, and competent judges, and any one can write to either for information concerning the responsibility of the writer, directing the letter to Wilton Junction. I also beg leave to refer them to you for any such information, having formed a very pleasant acquaintance with you very pleasant acquamance with you at Muscatine, a year ago. If you think the plan one which will help to find the best in the market, I wish you would add a word in the JOURNAL to help forward the work.

#### TEN DOLLAR PRIZE.

I wish to offer, through the BEE JOURNAL, the above named prize for the best Italian queen, home bred or imported, sent to me before Monday, the 22d day of August next, out of 6, forwarded to me by any 6 different breeders, each sending one tested queen, not to exceed one year old, this year's rearing having the prefer-Said queen to excel in the fol-

lowing respects:
1. The largest in size herself, and producing the largest worker progeny. Producing the brightest colored

workers.

Her progeny being beaceable in handling, and adhering to the combs the closest. As far as it can be ascertained

this fall, the most prolific breeder, and honey-gathering worker offspring.

I will pay each breeder the common price, also, which he charges for a

tested queen, providing she shows any of the qualities named above, in a su-perior degree, reserving the right to return her if she falls below the average standard of queens in my home apiary at this place.

Any queen-breeder who accepts the

above proposal, and becomes a contestant, to notify me by postal as soon as possible, at the same time announcing when the queen can be forwarded, when I will notify him by return mail

when I will notify him by return mail if he can be accepted as one of the 6 to compete for the prize.

The report of the committee, and payment for queens, and \$10 prize, to he made at the North Western Bee-Keepers' Convention, to be held at Chicago, Oct. 25 and 26, 1881.

It will be noticed that the breeder will get the ordinary price for his queen, and the ten dollars extra, if she proves to be the best. But none need send, except such as rank up with the best in the market.

Wilton Junction, Jowa.

Wilton Junction, Iowa.

The North Eastern Wisconsin Convention meets at Pewaukee, Wis. is introduced into its mouth and ulti-mately finds its way into the stomach. It is in this way that the bee gathers. This tongue is a very del-its honey. This tongue is a very del-

EDITOR AND PROPRIETOR,

CHICAGO, ILL., AUG. 10, 1881.

#### Exhibits for National Convention.

To all Bee-Keepers, fraternally greeting: I have been appointed a commit-tee to receive exhibits for the National Convention, and accept the trust. Persons sending articles for exhibition will please prepay freight or express charges, and send plain directions how to be returned; if desirous of selling them, attach a card stating the lowest price in plain figures. I will cheerfully and impartially attend to exhibiting queens, bees, hives, and other implements for the apiary, of any kind, free of charge. I will exercise all due care and diligence, but will not be re care and difficience, but win not be responsible for losses of queens or bees by death or accident. Learnestly hope that all who can possibly attend this Convention will do so, and see the beauties of the far-famed "Blue-Grass Region," the "home of Clay" and other statesmen, and its fine stock of every description. We cordially inevery description. We cordially invite you to come, thus illing a double mission. I shall feel grateful to all who have any intention of coming, to who have any intention of coming, to have them state the fact on a postal card addressed to me, and will cheerfully answer all inquiries to the best of of my ability. W. WILLIAMSON, Vice Pres. for Ky. N. A. B. K. Soc. Lexington, Ky., Aug. 1, 1881.

We cannot refrain from congratulating the North American Bee-Keepers' Society, upon the choice of Mr. Wm. Williamson as a special committee to look after the interests of exhibitors. In him are combined all the essentials necessary to a satisfactory execution of the trust-discriminating, unprejudiced, energetic, honest, and with all the courtesy that distinguishes the true gentleman. Exhibitors can trust to his judgment. He will leave nothing undone to make of the Convention. as it richly deserves to be, a complete success.

#### Which Are the Best Bees?

Mr. J. A. Johnson, Indiana, writes us as follows:

Which do you consider the best bees for honey-gathering, Italian, Cyprian, Syrian or Hungarian bees? I want the best queens to breed from in 1882. I have no knowledge of any only Italians. Could you not give us an article on the different races of bees now in the United States ?

We yet consider the better strains of Italians the best bees in this country, and that they will be the source from which will be bred the "coming bee," They possess so many desirable points of superiority, that it will be a difficult matter to supersede them with any of the newer races, about which there is much difference of opinion among careful and observing apiarists. We have not sufficiently tested any of them. to hazard a positive opinion from personal knowledge.

Regarding the Cyprians (from which much was expected), we have some very damaging reports. They are said sons for introducing such, but the chief to be very fierce in disposition, restless on the combs, easily aroused, and display no superiority to the Italians as honey-gatherers. Some of these phiections are undoubtedly based on less than the state of the second state of the second states and the state of the second states are undoubtedly based on less than the state of the second states are undoubtedly based on less than the state of the second states are undoubtedly based on less than the second states are undoubtedly states are

prejudice, or result from insufficient investigation.

The Syrian bees appear to have met with more favor, though many beekeepers are unable to appreciate any superior traits. The August number of the Bee-Keepers' Guide says:

Holy Land queens look like queens reared from hybrid Italians, and act like black queens. They are always like black queens. sired and running when you open the hive.

We have one colony of Syrians in the BEE JOURNAL Apiary. The queen is large, well-developed, and quite slow and deliberate in her movements. We have reared several very promising daughters from her, and all present the same general characteristics of the mother, and nearly approach duplication. They bear no resemblance to the hybrid Italian-in fact, not so nearly as the pure Italian does. The body is nearly a maroon-color, the segments being very distinctly cut, and a polished dark-mahogany color. The mother queen is certainly very prolific: the daughters are quite young yet, and were reared for the purpose of crossing with Italian drones. The workers, however, exhibit the characteristics mentioned in the Guide; they have a quick, nervous, hurry-scurry movement, are smaller than Italians, and much more ready to repel intrusion. They are very good workers, and we find they become a trifle more amiable with frequent gentle handling.

Of the so-called Hungarian bees in this country, we have not sufficient data for arriving at any conclusion unless that they are a hybrid, produced perhaps by mating black or brown oneens with Italian drones. As a race, we have no confidence in them.

With our present limited knowledge. and in the absence of well authentieated proof of superiority in other races, we would dislike advising any apiarist who now possesses a good strain of Italians, to make a change: but, rather, to make their improvements in the pasturage.

#### Management of Bees at Fairs.

Dr. J. W. Hudson, of Mayesville, S. C., makes the following request:

DEAR EDITOR: Please to give us full directions for showing, handling, dri-ving and the general management of bees at exhibitions and fairs. Give all the details, for many of us have never seen bees on exhibition, though we may know how to handle them in our own apiaries. I know of no one so capable of giving instruction in this matter as yourself, who have seen it done so often, both in this country and in Europe. Give us the practice in both countries, and your opinion as to on countries, and your opinion as to the best. I might have placed my bees on exhibition at our recent agricultu-ral fair, had I known anything about the management of them at such places. I do not know whether they should be confined in their hives or allowed to fly; in a word, I know nothing about it.

In the BEE JOURNAL for Feb., 1880. we urged that manipulations with bees be instituted at fairs, and bee and honey shows would be the most attractive features of State, County, and District Fairs. There are many good reaone, perhaps, is that those who pro-

the place of the old and undesirable question is a natural one: How can it be done?

When we were in England, in 1879, we found that the most attractive features of the fairs were the public manipulations with bees. There they had a large tent, as shown by the accompanying engraving. The inner circle was inclosed by mosquito bar or netting around the sides and about 8 feet high, leaving the top entirely open. Around this circle is a passageway, covered with canvas above and outside, about 8 feet high, and 6 feet broad; in this inclosure the audience assemble to witness, through the netting, the manipulations with beesdriving the bees from a skep or box hive, and finding the queen and exhibiting it to the audience. Here,

Tent for Publicly Ezhibiting Bees.

also, a lecturer was arranged for every hour, who gave a lecture for half the time, leaving the other half hour for the manipulations. The committee there charged 6d. (about 10 cents), for admission, every hour.

While in Great Britain we gave 8 half-hour lectures in this tent; each time the inclosure was full of eager listeners. Two of these were delivered at the Scottish Bee and Honey Show, at Perth, concerning which the Dundee Advertiser remarks as follows:

The manipulating tent was a scene of great interest during the show. It is of octagon shape, the operator standing in the middle, while the public feel secure under the protection of an intervening gauze screen. Driving bees from a straw skep and transfer-ring their combs to a bar-frame hive were hourly operations, and never failed to strike with astonishment the spectators, who stood aghast at seeing a human being unprotected turning up a hive of bees, and handling them as if they were blue flies.

Mr. Thos, G. Newman, editor of the American Bee Journal, was present during the first 3 days of the show, and gave lectures on American heekeeping, which were very interesing, and were well received. The Society presented to him a medal as a souvenir of his visit to this capatry and for of his visit to this country, and for the valuable services he has rendered to the present session of the Society.

The driving competition then com-The driving competition tuen com-menced, when 6 competitors entered the list. After the straw skeps had been halloted for, they were turned up one after another, and by gently tap-ping on the sides of the hive the bees were compelled to leave their homes with their stores of brood and honey. and to take refuge in an empty skep placed above. The queens were cap-tured and exhibited to a large assemblage of spectators.

For "showing" bees, observatory hives were used—those having glass

and the new methods and new ideas ing the entrance, and running through of practical management must take the side of the building, giving free passage, in and out, for the bees. ones. As we have so strongly advised | Sometimes, a glass box inclosing each public manipulations with bees, the frame, arranged like leaves of a book, with a common entrance to all of them, from the tube running through the side of the building, is made to exhibit bees. This gives an opportunity for thorough examination of the whole colony.

> Liberal premiums should be offered for the best exhibits, and these premiums should cover a large variety of special points in order to make the competition the more lively and attractive, as well as to enhance apiarian science in general.

Last year a small exhibition of bees, honey, and implements for the apiary, was made at the St. Joseph, Mo., Exposition. The superintendent of the apiarian department for this year, R. S. Musser, Esq., has written to us as follows:

The exhibits of last year have worked up quite an interest in progressive apiculture in this vicinity. Many then, for the first time, saw the many then, for the first time, saw the new apiarian improvements, single comb sections, comb foundation, etc., and had never heard of planting anything for their bees to get honey from. The finest honey in the world is produced in the Missouri Valley, from Variety to Deferrer City. Yankton, Dakota, to Jefferson City, Mo. 1f the various Fair Associations in this valley would give some encouragement to this industry, a large encouragement to this industry, a large amount of honey would be gathered in this valley, and put upon the market in first-class style. Not one cent in premiums was offered last year, but this year over \$120, besides diplomas are offered, and next year I know we can double the amount.

The fair for ISSI will begin on Sept. 5, and closes Oct. 10, and promises to be a very interesting occasion. The following is the list of premiums in the apiarian department:

Display of Italian bees,1st premium,

5; 2d premium, \$3. Display or black bees, 1st premium,

Display of back bees, 1st premium, \$2; 2d premium, \$1.
Display of queen bees, \$3.
Display of imported queen bees, \$5.
Display of bee-keepers' tools, implements and fixtures, \$5.

Best display of honey in comb, \$4; 2d premium, \$2.

Largest assortment of seeds for

honey plants, \$2. Exhibition of a swarm of bees in a hive, including their handling and best method of subjugation, to be practically illustrated on Friday, Sept. 9, 1st premium \$5; 2d premium, one tested Italian queen, offered by D. G. Parker, valued at \$3.

Honey extractor, \$2. Honey knife, diploma. Bee smoker, diploma. Atomizer, diploma. Bee feeders, diploma. Comb foundation, diploma

Felt blankets, for covering broodframes, diploma

ames, appoint.
Bee veils, diploma.
Gloves, rubber gauntlets, diploma.
Sections, all in one piece, diploma.
Sections, dovetailed, diploma. Wax extractor, diploma.

#### SPECIAL PREMIUMS.

For best display of comb honey, \$5. For best 50 pounds of comb honey, in 1 and 2-pound boxes, \$5.

Pay for best 30 lbs. of comb honey,

exhibited in For 2-pound boxes, \$15.

For the best and largest display of

comb honey from any one apiary in the Ninth Congressional District of Missouri, one copy of Daily Herald for

seeds for honey plants—exhibited by a

dealer in the same, \$10.

For the best display of comb honey, exhibited by a lady from either Kansas. Nebraska or Iowa, \$20. For best display of comb honey, exhibited by a Missouri lady, \$20. For the second best display of comb

honey, exhibited by a lady, a patent dough kneader and patent biscuit and roll cutter, for family use.

The managers of the St. Joseph Fair have, by their foresight, given a grand example for others to follow, and we hope the time will very speedily come when apiculture, so long neglected by the managers of fairs, will receive its due share of their atten-

#### MISCELLANEOUS.

Bees Within a Statue.—The Bienen Vater says:

In the town of Wernstein, Upper Austria, there has stood upon a high stone base, from time immemorial (life size) a statue of a madonna, rial (life size) a statue of a madofina, constructed of clay. Quite a long time the supposition had gained ground that within it was a well-regulated and rich colony of bees. But no one seemed inclined to disturb the little honey gatherers, within their singular asylum. A few days ago, workmen commenced to renovate the led and venerable statue to save it old and venerable statue, to save it from ruin, and first they had to search for the abode of the bees. How great was their surprise when they found the entire hollow space within filled with the richest of comb honey. Two large water tubs full of honey were taken from this statue. A tavern-keeper, who undertook to perform this job of removing the honey, received such a treatment from the angry bees that he had to go to bed immediately. Now, people remembered that this colony had sent out 3 swarms last fall, of which 2 were captured, but the third went to the woods. Those bees had made the statue their home for over 7 years; from this one from ruin, and first they had to search home for over 7 years; from this one can judge of the wealth of honey found.

The Honey Crop in N. Y. and the East.—The Bee-Keepers' Exchange remarks as follows on this subject:

We are asked, what the prospects we are asked, what the prospects are for good prices in the honey market. We hope to see prices high, but doubt whether they will be. True the number of colonies is few, but the yield in most quarters is enormous. Throughout Central New York, and Vermont the grap will be very large. Vermont, the crop will be very large per colony. Very favorable reports come from various and widely separated localities. Different from many articles, small production of honey does not and will not advance prices very much. We counsel our readers to sell their crops at home as much as possible.

Rate at which Honey is Gathered .-Mr. L. C. Root, in the American Agriculturist, gives the following figures on this interesting topic:

I shall commence here to give, as I I shall commence here to give, as I have done heretofore, the weight of honey taken from a selected hive at different dates. We have chosen for this purpose one of our best Italian colonies, and have given it every adventage. The county was very problem. vantage. The queen was very prolific, and choicest combs have been furnished so that she has been able to do

been supplied with 32 combs, from which honey is to be taken with a honey extractor. I shall not only give the weight of honey as it is taken out from time to time, but also give the gain at intervals of a few hours, on different days, which will prove of interest to the reader.

The first honey was extracted June 25th, when it was all removed from

25th, when it was all removed from the entire number of combs. The amount was 96 lbs. June 26th was the amount was 96 lbs. June 26th was the first warm, fair day for over a week, and during the day they gathered over 20 lbs. In sections where the fall pasturage is not abundant, I would caution bee-keepers to not add boxes too late in the season, as well as too use care in extracting too late. Many who are inexperienced may extend this so far, as to fail to leave sufficient stores

far, as to fail to leave suncient stores for winter.

The possibilities of bee-keeping are not fully comprehended even by some of our active bee-keepers. I do this to encourage a more thorough investigation of the best methods, which will so surely lead to results almost incredible to those unacquainted with modern bee-keeping. modern bee-keeping.

Midsummer Bee Management.-The Rural New Yorker contains the following article on Summer Management;

In case of scanty pasturage for bees at this season of the year, there is great necessity for providing them with food in the hive. The feeding should be done regularly after sunset, and as they are more liable to be vicious when the fields fail to supply them with honey, the bees should be applied sufficiently to keen them unterly smoked sufficiently to keep them quiet; smoked sufficiently to keep them quiet, and then, as always, they should be disturbed as little as possible. The practice of feeding, either in Spring before flowers bloom or in the Summer intervals during the absence of mer intervals during the absence of the best honey-producing flowers, is a wise one, as it keeps the bees in good condition for the work before them. Cheap honey is recommended by some as a good food, but "A" sugar reduced to the consistency of honey, is quite as good. There is but little to be said in favor of feeding grape-su-gar and glucose. gar and glucose Honey which is removed from the

hive in hot weather is apt to be inhabited by the moth worm, which hatches from the eggs deposited in one way or another by the bee-moth. Just how, another by the Bee-moin. Just now, or when, this is done is not known, but it is not at all unlikely that the moth finds her way into the hive and there lays her eggs, though some say she deposits them on the bottom boards of the hive and then they are carried inside by adhering to the feet and legs of the bees. If honey taken and legs of the bees. It honey taken ont is to be kept in boxes during the Summer, it should be closely watched and at the first appearance of a fine whitish powder on the combs, it should be removed by finnigating with sulphur. It is well to snoke combs from which the honey has been extracted.

It is important to keep the light-colored (basswood or clover honey) separate from the dark-colored, such as buckwheat honey. The apiarist who rate from the dark-colored, such as buckwheat honey. The apiarist who expects to get good prices for his honey will be careful not to let these two kinds go to market in the same box. White honey, though it be but soiled with dark, will not command a good price. However, nice buckwheat honey, though not commanding to large prices is yet a source of much as large prices, is yet a source of much profit, inasmuch as, in some sections, a good supply is obtained after the white honey plants have failed. The a good supply is obtained after the white honey plants have failed. The hives should be protected from the intense heat of the sun during the heated term, though early and late in the season it is essential that the hives be exposed to the warm rays of the sun.

August is a good month for Italianizing, as the queens can be obtained quite reasonably then, and good Ital-ian workers will be ready for the next nished so that she has been able to deposit eggs to her utmost capacity. The weather has been favorable to rapid increase. The bees are in a two-story large Quinby hive, which has

Glacose.—Mrs. L. Harrison, Peoria, III., writes as follows in Gleanings in Bee-Culture on glucose and its manufacture.

Friend Root:-1 extend unto you Friend Root:—I extend unto you my right (F) in token of approval of your present position on that vexed glucose question. Your former one was always a sore trial to me, for I was fearful that the money that was in it, so warped your better judgment that you could not see it in its true light. When you invoked the blessing of Heaven upon the Buffalo Sugar Co., it was a dose too great for me to swallow; and the longer I chewed the wallow; and the longer I chewed the bigger it got.

Hamlin, who is the principal member of the Buffalo Co., has large works ner of the foliatio Co., has large works here (Peoria, 1ll.), and has recently purchased an extensive tract of land in the vicinity of Des Moines, lowa, to erect glucose works there. He has acres upon acres of lime-kilns to man-facture that compound for his manu-facture. He knows no God and no factories. He knows no God and no Sabbath. His employes are not freemen, but slaves, compelled to work every day in the year, with the eye of the factories and the state of t a watchman upon them lest they cease from their toil, and watchmen over watchmen, with small wages; and when he walks through his vast works. an armed guard protects him. The smoke from those vast chimneys never ceases, nor does the deadly waste that pours into our magnificent river, to be the certain death of the finny tribe. The funes that are wafted over our city, from the boiling vats of corn starch, containing deadly chemcom staren, containing deady chemicals, can be compared to nothing else than to pens where a million pigs are kept and fed on distillery slops. We who have braved the privations of frontier life to obtain a home have no reduces. for there are millions in it redress—for there are millions in it. Car-load upon car-load of lime, nitric and sulphuric acid are daily used in the manufacture of glucose. There and suppure actuate dary user in the manufacture of glucose. There have been syrups sold in this city that have eaten a hole in a table-cloth! This company have bought chemists as as nitric and sulphuric acid.

But the people are awakening. They are inquiring why they feel so strangely after eating sugar and syrup, and what makes the little one's lips so black, as if it had been licking the ink-bottle after its meal of bread and syrup, along as heavy

and syrup—clear as honey.

Brother Root, you are a busy man, I know; but take time, and if you can't get time on a week day, do it on Sunday. Tie up your handkerchief full of day. Tie up your handkerchief full of your best Buffalo sugar; sit down by a pail of water and wash it; and when you are through, tell us what you have left, and whether the water is sweet or not,—and what kind of stuff is left in your handkerchief. Be candid, and tell us all about it, if it does hurt worse than any bee-sting you ever had; and whether you would like to give it to Blue Eyes or the baby to eat.

Lean not call down the blessing of

I can not call down the blessing of Heaven upon the Buffalo Co.; but may Almighty God bless good father Langstroth, and continue unto him the use of his mental powers! May he long stand upon the watch-towers of this great industry, that he has given this great industry, that he has given his lifetime to promote, and run up the signals of alarm in full view of his be children, warning them of the vagaries of such impulsive persons as A. I.
Root and———Mus, L. Harrison. Root and—— Mus. L Peoria, Ill., July, 1881.

Bears Attacking Bee Ranches .- The Bee-Keepers' Magazine, gives the following account of bears attacking bee ranches in California:

The business of a California beethe outsiness of a cannot have been is not always one of giddy pleasure, nor of sweet and enjoyable tranquility. Not only have the apiarists of that otherwise favored land had their hopes blasted by a short crop of honey, but also the great hungry mouthed depredator, known as the grizzly bear, comes prowling at the dead hour of night, when all is still, save the gentle murmur of the bees in save the gentle normur of the bees in their tranquil habitations, or the doleful screech of some bird of wisdom in supplied free, in any quantity desired.

the distant tree-tops—then he comes the distant tree-tops—then he comes and seeks the bee-yard. His ways are mysterious and not often inquired into by the apiarist. Still, withal, when patience ceases to be a virtue, then his thieving highness is dealt with in the following manner by the bee-keepers of California:

"Mr. Rowell, of Santa Ana, who owns a bee ranch in Trabuco canyon, and who has suffered the loss of several colonies of bees from the depredations of bears, determined to lie in wait for the unwelcome visitants, and suc-ceeded in shooting a large grizzly, who came for his regular meal of (bee) who came for his regular mean of (bec) bread and honey. The bee men are jubilant over the killing already of three or four of these grizzly knights of the mountains, but say there are a few more of the same sort. Mr. Rowell has regaled the epicures of North and the configuration of the same sort of the same sort. Santa Ana with a toothsome steak from bruin's carcass, which had been made as sweet as honey and honey comb could make it."

Are Cyprian Bees Ferocious?-This question Mr. C. A. Abbott, editor of the British Bee Journal answers thus:

We are sorry we cannot confirm the good character for gentleness given to the Cyprians. Such character came with them when they were exhibited at the Crystal Palace Show, and those present, when they were handled on that occasion, were so impressed with their ferocity that their 'purity' was doubted, and reference made to the authorities at the British Museum. authorities at the British Museum. Since then we have had considerable experience with these bees, having received some direct from Cyprus, and they have invariably proved most they have invariably proved most fightable; the Syrians may be put in the same category. As workers and breeders they are both good; but the hest workers we have ever known are the cross from the Syrians. They, however, are not easily subdued.

Experience while Uniting Swarms.-In the London Journal of Horticulture Mr. W. Riatt, gives the following experience while uniting swarms:

While uniting some swarms a rather rare circumstance transpired. After one queen had been removed, the bees one queen had been removed, the bees continued very excited, which led me to think they had balled the other queen. This I found to be the case. She also was caged, but left in the hive. Still the excitement continued all night, and next morning when I went to liberate the oneon I found the care. to liberate the queen I found the cage surrounded by an excited mass of bees Variation of the prisoner; at once she was again balled. Such a case could only be accounted for by supposing that in some mysterious way a third queen had enfered the hive, so 1 at once removed the balled. In a few moments the excitement died away, the hees set to work with a will, and in twenty-four hours had all their combs built out and mostly furnished with honey, besides starting in a case of sections. The intruder, of which I of sections. The intruder, of which I only had one hasty glance, turns out to be the late head of a nucleus that stands 10 yards off. She had been out on her wedding trip while the swarm was in the air, and, joining it, entered the hive, where she seemed to be preferred to the pair of old queens. A few hours more and 1 should have been minus 2 fertile queens, which means just now a prospective loss of 5,000 bees a day for at least a week.

🕼 Mr. Geo. E. Hilton, Fremont Center, Mich., having some nice comb honey, took 2 boxes of it to the Indicator, published in that place, as we notice by an item in that paper.

We have prepared a SPECIAL edition of the BEE JOURNAL, just as it will be published in 1882 (16 pages), for distribution at Fairs, Conventions,

Bee Stings. - A writer in the Jour-Bee Stings.—A writer in the Journal, some time since, gave us a reinedy for bee stings—"hold your tongue." I find that one generally has use for that member about the time a bee sits down on him. If Mr. "Hold-your-tongue" will smoke the place thoroughly, where the stinger went in, I think that he will find it a much easier task, and in a short time le will hardly know that he has been stung. It serves not only to prevent stung. It serves not only to prevent the scent from being communicated to the rest of the colony, but kills the poison. Try it. S. GOODRICH. Saybrook, Ill.

Obsence, Scientille, but Silent Bee-Men.—On page 226, of the Bee Jour-NAL, Mr. Clarke says that he has fer-NAL, Mr. Clarke says that he has refreted ont an obscure scientific apiarist. These are the kind of men we like to hear about; but we would rather hear from than about them. Mr. George Surgeon, no doubt, has a great deal of knowledge and experience of the says would write. ence, and if such men would write an article, now and then, for the BEE an article, now and then, for the BEE JOURNAL, it would do some of us (especially those who are young in the business) much good. It seems to me, from last winter's reports, that most of us have much to learn yet. I visited a neighboring bee-keeper, a short time ago, and handed him a copy I had with me of the BEE JOURNAL and asked him to subscribe for NAL, and asked him to subscribe for it. He replied: "No; there is no necessity for me to spend my money in that way; I know all about bees." Yet, out of the 9 colonies he prepared for winter last fall, he has but 4 left. for winter last fall, he has but 4 left. Now, if the scientific obscure apiarists would write an article now and then for the BEE JOURNAL, they would most certainly gladden the hearts of many of its readers, by letting their light shine, for we desire to profit by the experience of others. I am well aware that we have many excellent writers now whose efforts cellent writers now. whose efforts have been and will be highly apprecia ted. I commenced the season with one colony, which was divided May 16. I have received 35 pounds of comb honey in 2-pound sections from the younger colony. They are both very strong, and are bringing in a little honey from the second crop of white clover, which is very short on account of the dry weather.

A. E. FOSTER.
Covington, Ky., July 30, 1881.

Stung by Cyprians.—My little boy was nearly stung to death by cross Cyprian bees, a few days ago. The child is 20 months old. He had not child is 20 months old. He had not been missed from the house when his mother heard him scream in the apiary. He was in front of the hive. 

Hamilton, Ill., Aug. 1, 1881.

A Colony Determined to Keep Two Queens.—I have fought the elements for 8 months, and have had but little reward, except bringing my bees through with but little loss. The winter here was quite favorable for bees, though the spring has been the worst for bees that ever was known. My bees are now in prime condition for storing surplus. The basswood will soon be in bloom; we shall have an abundance of it, as the late rain has, with the warm weather, revived things very much. My bees are nostly Italians; I find them much ahead of the blacks. I own ½ of a small apiary located at Charles Burker's; we have things in fine condition to produce honey. I think we are fortunate; we have one colony that accepted 2 queens to lay, and seem to be perfectly thrown worst for bees that ever was known.

bees were very much excited until hees were very much excited until they had another started. The first daughter hatched before there were drones. She remained with the mother about 10 days, when I removed her, and they at once made a queen-cell and the mother remained in the bive; the daughter became fertilized and also remained in the hive and laid about one week. I removed her and introduced her to another colony, where she is filling the combs profusely. I see to-day the parent colony has a queen-cell with an egg in it, which queen-cell with an egg in it, which proves that they are determined to have 2 queens. The daughters seem to be exactly like their mother. I value these queens much. I will report again hereafter. The BEE JOURNAL is an excellent thing to keep away the blues. I hope I shall be able to be one of its readers as long as I read anything. G. H. GREEN. Athens, Maine, July 11, 1881.

Very Little Surplus Honey.—Bees have done very little in the way of collecting honey here, so far this sea-Fruit blossoms and white clover son. Fruit blossoms and white clover yielded comparatively no honey. Basswood bloom was immense, but lasted only a few days. Vegetation is dying, being burned up by the heat and drouth. Corn cannot make over <sup>1</sup>3 of a crop. We have no show for <sup>1</sup><sub>3</sub> of a crop. We have no show for any surplus honey here at present; our hopes are blasted. T. J. WARD. St. Mary's, Ind., Aug 1, 1881.

Feeding Full Winter Stores .- Is it possible to feed up and earry through the winter bees in box hives, after be-ing robbed clean at frost? A friend ing robbed clean at trost? A friend told me he was going to brinstone a part of his bees. I can have the bees and brood comb free—would it pay me to try to carry them over? I wonder if the balance of the country is as dry as Southern Illinois is at this time. as Southern Illinois is at this time. We have not had any rain for six weeks to-day. Grass and clover are dead; in fact, the meadows would burn like old grass, if the match was applied. It it does not rain, and that soon, there will not be corn raised to fatten the hogs. This has been, and I fear will remain an extremely bad year for bees. They are now consuming the white clover surplus. Another question: Do bees usually store sufficient honey in brood frames to carry them through the winter? Long live the BEE JOURNAL. D. W. BELLEMEY. Vienna, Ill., July 31, 1881.

[It is possible with an entrance feeder, or a division-board feeder, such as Prof. Cook describes in his "Manual of the Apiary," to feed enough sugarsyrup to winter the bees nicely; and if bees at an extreme cost of \$2,50 per colony are any object, it will pay you to take them. Ordinarily, with a medium-sized brood chamber, bees will store an abundance in the brood frames for wintering on. We saw many colonies last fall in Kane Co., Ill., which had not honey enough in the brood frames to last half the winter; but it was because they could not find the honey to store, not from lack of room, —Eb.]

On the Wing.—We left our home, Peoria, Ul., on the evening of July 27, our destination being St. Johns-bury, Vt., the birth-place of Fairbanks scales. All the way we were on the qui rive for honey plants, but recognized very few until we arrived at Albany, N. Y. From there to Troy we were gladdened by the sight of sweet were gladdened by the sight of sweet clover in all the rocky crevices. The road from Greenfield, Mass., to this place, is edged with gold—golden rod everywhere—against the side of depots, lumber, etc., in some places appearing like a cultivated crop—a sea of waving gold. The bouquets in the church decorations were composed in have one colony that accepted 2 queens to lay, and seem to be perfectly thrown out of order when one is removed. I knowingly doing honor to a bec-keeper have removed 2 this season, and the from Illinois. Mrs. L. HARRISON.

Drouth.-My bees have done very poorly this season; I have had very few natural swarms, not over 1,000 pounds of extracted honey and 125 pounds of comb honey; and with 70 or 75 colonies we are in the midst of one of the most disastrons drouths I pounds of extracted honey ever saw, and not a drop of rain for nearly 5 weeks. It was very wet un-til the dry weather set in. What has become of M. B., of Fincastle, Ind., and that promised article on "Fertil rightion" in time for the present, senint that your interest is search son? Has he or she or they forgot it, or did their bees all die in the spring, or, or—what? The season is marchive least your come.

ing on, and still it does not come.

J. F. Love.
Cornersville, Tenn., Aug. 2, 1881.

[M. B. is making experiments and will report when there is anything reliable to report.—ED.]

Ants.—Every bee-keeper in the land has met and fought the intolerable ant-nuisance, in one shape or another, and yet they are not conquered. I have had them wade over seas of carbon oil, to reach the hive, where they might domicile on the muser side of a bon oit, to reach the linve, where they might domicile on the upper side of a warm honey-board, among the caps and supers to propagate their millions. Now for the remedy. Look up an old milk pan, holding about a gallon, or larger is better, whittle a handle on the thick end of half a pine shingle, slip the thin end under and nail with clinch tacks from the inside bottom of pan and your cremator is finished. pan, and your cremator is finished. Fill your pan about half full of dry shavings or excelsior, and you are now ready for the conflict. Fire the shavings first, then quickly take off the top or covering of your hive, with the flaming pan in one hand and a broomcorn whisk in the other, you will scoop both eggs and ants in the flames. Those escaping, you can get on a sec-ond trial. For 25 years I have fought this ant nuisance in vain. This year this ant nuisance in Vain. This year I have conquered; on a hundred hives in my apiary not a spoonful of ants can be found to-day. Give it a trial; when a thing is burned up that is about the end of it. J. W. BAYARD. Athens, O., Aug. 13, 1881.

Bees in Kansas.—Last winter being a very severe one, about 23 of the bees in this neighborhood died. I lost all but 3 colonies; I had 20 in the fall, in Langstroth hives; I wintered out-of-doors, unprotected. The 3 that came through the winter were very weak in the spring. I took good care of them, following the directions given in the BEE LOURNAL, and in the manuals Bees in Kansas.—Last winter being BEE JOURNAL, and in the manuals. I bought 2 colonies of bees, one black and one Italian, making 5 colonies to start with again in the spring. I start with again in the spring. I increased to 8, which are in good condition now, except one weak. This season has not been very promising for bees. In the spring they commenced work in the section boxes, but in May, June, and July it became so dry that they used all the honey they had. During the past week they began to work on buckwheat, and are gan to work on buckwheat, and are fast filling the hives up with brood. The bees and queens of some colonies are breeding in the upper story and leave the lower story empty. What leave the lower story empty. What shall I do to get the brood down in the wer story again? ERNST ZABEL Williamsburg, Kan., Aug 1, 1881.

Put in the center of the broodchamber 2 or 3 empty combs,or frames tilled with foundation.-Ep.]

Gratitude to Messes. Jones and Benton.—The readers of the Bee Journal Menton in the Bee Journal Will be pained to learn that a recent letter from Mr. Benton, just received, states that his health is not restored. The effects of the severe exertions and great hardships incident to his ardnons labors to secure the A. dorsala, are slow to leave him. All of us will surely hope that they will not be lasting, as, surely, Mr. Benton has richly earned the hearty gratitude not only of American apiarists, but those of the whole world. Though Messes. Jones and Benton may not secure great pecuniary benefits for Gratitude to Messrs. Jones and Ben-

their grand undertaking, they surely may feel the proud satisfaction of knowing that they have done a great favor to apiarists.

Fresh Every Week.—The Weekly BEE JOURNAL is so valuable to me that I can hardly wait for the next number. I have been reading nearly all the literature devoted to bee culture, and I find the American Bee Journal the best; perhaps that is in part, because it comes so fresh and L. J. Diehl. clean every week. Butler, Ind.

Stizus Grandis.—I send you two spe cimens of the great wasp family (I use the word wasp in the broad sense), which inhabits the Middle and Southern States. They were captured and presented to me by my nephew, Mr. L. W. Demaree. They are quite formally and the state of t presented to me by my nephew, Mr. L. W. Demaree. They are quite for-midable-looking insects when alive and active. Being somewhat rare here, I have not been able to study their liabits successfully. What ac-count can you give of them in the BEE JOURNAL? G. W. DEMAREE. Christiansburg, Ky., July 28, 1881.

[This is Stizus grandis, Say. It is one of our largest and handsomest wasps, and is over 112 inches long. The color is black, handsomely ornamented with yellow bands. Like all wasps, these are predacious, and by destroying other insects (mostly those

that are noxious) they do no little good. Their stings are formidable; but like other Hymenoptera, they seldom sting unless rudely treated. The fear of bees and wasps that is so often felt, is unnecessary. Let them alone, and they will almost always return the civility; maltreat them, and they will

repay with interest.—A. J. Cook.]

The time selected by the Executive Committee for holding the National Convention, at Lexington, Ky., is October 5, 6, and 7, 1881. All beekeepers are invited to attend and take part in the deliberations of the Convention. As Lexington is a central point, the Executive Committee hope point, the Executive Committee hope to have a large attendance from the the North, South, East and West, and from Canada, and that the 12th annual meeting of the North American Bee-Keepers' Society will be the most in-teresting meeting that the bee-keepers

teresting meeting that the bee-keepers of the United States have ever held. The National Convention will be held during the time of holding the St. Louis Fair and the Expositions at Cincinnati and Louisville, and that all passing through those cities can get the benefit of excursion rates.

N. P. Allen, Pres.

The Northwestern Bee-Keepers Association will meet in Chicago, on Tuesday and Wednesday, October 25 and 26. All bee-keepers are cordially invited to attend. It is desired to make this one of the most interesting conventions ever held in the United States. C. C. Miller, M. D., Pres. C. C. COFFINBERRY, Sec.

The Northern Michigan Bee-Keepers' Association will hold its fourth Annual Convention at Maple Rapids, Clinton Co., Mich., Oct. and 12, 1881. O. R. GOODNO. Sec.

The Northwestern Illinois and Southwestern Wisconsin Bee-Keepers' Association will hold its next meeting Aug. 30, at Rock City. Stephenson Co., Ill. Jonathan Stewart, Sec. .

The Southwestern Wisconsin Bee-Keepers' Association will hold its next meeting in Platteville, Grant Co., Wis., Nov. 30, 1881.

N. E. FRANCE, Sec., Platteville, Wis.

The Eastern Michigan bee-keepers'Association will hold its fall meeting in Detroit, Oct. 4, in the Y. M. C. A. hall, at 10 o'clock a. in. A. B. WEED, Sec.

#### SPECIAL NOTICES.

Single copies of the Journal sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference. ....

When changing a postoffice address, mention the old as well as the new address.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Photographs of prominent Apiarists
—Langstroth, Dzierzon, and the baron
of Berlepsch.—Price 25 cents each.

Constitutions and By-Laws for local Associations \$2.00 per 100. name of the Association printed in the blanks for 50 cents extra.

The Beauty and Color of the hair may be safely regained by using Par-ker's Hair Balsam, which is much ad-mired for its perfune, cleanliness, and dandruff eradicating properties. 31w4

early all the ills that Afflict Mankind can be prevented and cured by keeping the stomach, liver and kid-neys in perfect working order. There is no medicine known that will do this as quickly and surely, without inter-fering with your duties, as Parker's Ginger Tonic. See advertisement.

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them.

Premiums.—For a club of 2, weekly we give a copy of "Bees and Honey;" for a club of 5, weekly, we will give a Cook's Manual, a Bee-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the JOURNAL for a year free. It will pay to devote a few hours to the BEÉ JOURNAL.

It would save us much trouble, if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.—
Also, if you live near one postoffice and get your mair at another, be sure to give the address we have on our list.

#### CLUBBING LIST.

We supply the Weekly American Hee Jour nal and any of the following periodicals, for 1881, at the prices quoted in the last column of figures.

### POPULAR

# HONEY KEGS.

These kegs answer the popular demand for honey in small packages, and when compared with large barrels holding from 300 to 500 lbs. each, they are fully as cheap and often cheaper. They need no waxing but should simply be thoroughly scalded with boiling water before using. The leakage so often occurring in the large hard-wood barrels can be entirely prevented by using the White Pine Kegs. Considering the cost and trouble of waxing, the loss of honey by leakage, and the ease with which these kegs can be handled and shipped, with an actual saving in original cost, it must be apparent to all that they are the best. Prices: These kegs answer the popular demand all that they are the best. Prices:

50 lb. Kegs, each ...... 350 100 lb. Kegs, " .....55c 160 lb. Kegs, " ....65e

# The Bee-Keeper's Guide; Excelsion Honey Extractors. The ORIGINAL

### MANUAL OF THE APIARY,

By A. J. COOK,

Of Lansing, Professor of Entomology in the State Agricultural College of Michigan.

#### 320 Pages; 133 Fine Hinstrations

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly illustrated. The first edition of 3,000 copies was exhausted in about 18 months — a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings— the products of the Honey Bec; the races of bees; full descriptions of honey-producing plants,trees, shrubs, etc.,splendidly illustrated—and last,though not least, detailed instructions for the various manipulations necessary in the appary.

This work is a masterly production, and one that no bee-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the It is not only instructive, but intensely interesting and thoroughly practical.

Read the following upinions of the Book;

All agree that it is the work of a master and of real value.—L'Apiculture, Paris.

I think Cook's Manual is the best of our American works, -Lewis T. Colny.

It appears to have cut the ground from under future book makers.—British Bee Journal.

tuture book makers.—British Bee Journal.

Is a masterly production, and one that no beekeeper, however limited his means, can afford to do without.—Nebraska Farmer.

Prof Cook's valuable Mannal has been my constant guide in my operations and successful man agement of the apiary.—J. P. WEST.

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—E. H. WYNKOOP.

This book is just what everyone interested in hees ought to have, and which, no one who outains it, will ever regret having purchased.—Mich. Far.

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Herida, Monticello, Ill.

My success has been so great as to almost aston-

To all win wish to engage in oec culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Herald, Monticello, Ill.

My success has been so great as to almost astonish myself, and much of it is due to the clear, disinterested information contained in Cook's Manual.—WM. VAN ANTWERP, M. D.

This book is pronounced by the press and leading becomen to be the most complete and practical treatise on hee-culture in Europe or America; a scientific work on modern bee management that every experienced beec-man will welcome, and it is essential to every amateur in bec-culture. It is handsomely printed, meatly bound, and is a credit to the West.—Western Agriculturist.

This work is undoubtedly the most complete manual for the instruction of bec-keepers which has ever been published. It gives a full explanation regarding the care and management of the apiary. There is no subject relating to the culture of bees left intouched, and in the compilation of the work Prof. Cook has had the advantage of all the previous knowlede of apiarists, which he uses admirably to promote and make popular this most interesting of alloccupations.—American Inventor. It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—Ky. Liv. Nock Record.

With Cook's Manual I am more than pleased. It is fully up with the times in every particular. The richest reward awaits its author.—A. E. WENZEL.

It is a credit to the author as well the publisher.

It is a credit to the author as well the publisher. I have never yet met with a work, either French or foreign, which I like so much. FARIE DV Bors, eather of the Balletin D' Apiculteur, France.

It not only gives the natural D Apicaucar, Francisch Li not only gives the natural history of these industrious insects, but also a thorough, practical, and clearly expressed series of directions for their management; also a botanical description of honey producing plants, and an extended account of the enemies of bees. Democrat, Pulaski, N. V.

producing plants, and an extended account of the enemies of bees. Democrat, Pulaski, N. V.

We have perused with great pleasure this vade mecan of the bee-keeper. It is replete with the best information on everything belonging to appelling the production of the bee-keeper. The subject, we say, obtain this valuable work, read it carefully and practice as advised.—Agriculturist, Quebec.

It may safely be pronounced the most complete and comprehensive of the several manuals which have recently appeared on the subject of bees and their handling in aphures. The studies of the structure of the bee, the different varieties, the various bee products, and following these the points of management, extending to the smallest details, are all of high and practical value. Prof. Cook has presented the latest phases of progressive bee keeping, and writes of the themes discussed in the light of the sum experience.—Pacific Rural.

Of the many excellent works which we have examined on bee-calture, we consider Prof. Cook's the most valuable for the study of those who contemplate going into the business or are already keeping bees. If thoroughly studied, and its teachings conformed to, by the apharist, who exercises a reasonable degree of common sense, he or she cannot full to achieve at least a reasonable degree of success. The author addresses binnself to the work with a degree of enthiashem which entires the reader with him to the end.—Konsos Farmer.

#### Preparing Bees for Winter.

DAVID HIGBEE.

Last fall I had 7 colonies in Lang-

Last fall I had 7 colonies in Langstroth hives; 3 were made with double walls and building paper between the walls, and to fill the space excelsior was packed in closely. All my hives, except one, were packed by the use of chaff in the upper part of the hives, at least 5 inches thick, also 1 or 2 frames on each side of the broodnest were removed, to be again returned in the spring, and chaff packed on the sides in their places. The 3 hives (not double-walled) I also packed as above and covered over with slough grass. The others I did not so cover.

I made a mistake with the single-walled bives in placing them only 4 inches from the ground. When the deep snow drifts filled my garden in February where the bees were, and began to melt, before I was aware of it the water had risen 3 inches high above the entrances of the single-walled hives that were covered with the hay. I made every effort to secure drainage, but found the hives were frozen fast in solid ice which I could not remove without destroying the hives, and inasmuch as the bees were supposed by me to be smothered, I abandoned them as lost and did not go near them again until April I, when were supposed by me to be smothered, I abandoned them as lost and did not go near them again until April I, when they were standing in a pool of snowwater 2 inches over the alighting-boards. I then opened them from the top, when I was astonished to not only find them alive but in good condition, and full of hatching brood above the water-line. They have been in better condition than any of my bees all the season. The others came

out well, except the one not packed in chaff, which was very weak, although in good condition in the fall, having yielded 75 pounds of surplus comb honey last year.

I found in all my hives that the chaff next to the frames was dry, but nearly rotton on the top, from accumulated moisture; this suggests to me the apparent necessity of a little top ventilation. From the fact that my bees did well for 2 months with the bottom entrance frozen shut, I conclude it is not essential.

This fall I will set my bees one foot above ground, and pack as before. How about lime over the chaff to absorb this moisture? This has been a

#### Biographical-Dr. N. P. Allen.

Dr. Allen was born in Cumberland Co., Ky., April 30, 1830, was reared in Warren county, Ky., and educated in the common schools and academies of the county. He received his professional education at the Ohio Dental College, Cincinnati, Ohio, in 1851-52. In 1855 he married Miss Kate E. Edmonds, of Glasgow, Ky., and has lived upon a farm ever since, his health not allowing him to be contined in a dentist's office. It being necessary for him to spend much of his time in active exercise in the open air, he devoted his time to agriculture, bee-Dr. Allen was born in Cumberland

He has spent much time in the study of bee-culture, but has never had any intetest in patent hives or the sale of any apiarian tools, and has spent much time and money m spreading a knowledge of rational bee-keeping among the bee-keepers of his locality and State. He has never failed to attend the bee-keepers' conventions of his county, district, or State. He has traveled in Kentucky and other States, in the interest of apiculture. The Doctor has given his whole energy and influence to develop the honey resources of the country, and without reward or pecuniary advantage, except the thought that he has been instrumental in dispelling, to some de-He has spent much time in the study strumental in dispelling, to some de-gree, ignorance and superstition in regard to the cultivation of the honey bee, and in seeing thousands of pounds of pure honey gathered, where none was gathered before.

#### Getting Bees off the Combs.

G. M. DOOLITTLE.

On page 222, H. F. B. wished to know how to get bees from the combs. He said "we are told to shake them off, but there must be a particular way to shake them that I do not know of, for that plan to answer." I always shake the combs to get the majority of the bees off, and with the blacks every bee can be shaken off.

To do this, place the ends of the frame on the ends of the 2 middle fingers of each hand, and then, with a quick upward stroke, throw the ends of the frame against the ball, or thick part of the hand, at the base of the thumb. As the frame strikes the hand let the hands give a sudden downward motion, which makes the shock still

let the hands give a sudden downward motion, which makes the shock still greater. As the frame strikes the fingers again it is thrown back against the hand, and so on till all, or nearly all of the bees are off. The principle is that the bee is on her guard all the while to keep from falling off, thus holding on tenaciously so as not to be easily shaken off. By the sudden stopping of the upward, and a quick downward motion, the bees are thrown off their guard and disloged from the off their guard and disloged from the comb. I do not remember of even having broken a comb by shaking it, as above described. Now, if we dis-turb the Italians, causing them to fill turb the Italians, causing them to fill themselves with honey, they can then be shaken from the combs about as easily as black bees. But even if we cannot afford time to wait till they are filled with honey, 4-5 of them can be shaken off. To get off the remainder I take a turkey or goose quill and trim down the feather edge about 15 on the wide side, and with this I have no trouble in getting off those reon the wide side, and with this I have no trouble in getting off those re-maining, without irritating them. Of course it will appear a little awkward at first, but will soon be found easy

enough. Borodino, N. Y., Aug. 6, 1881.

very poor honey season in this locality; I do not hear of any one yet securing any surplus. I only made one new swarm this year, as I was all the time waiting for the honey season to set in

time waiting for the honey season to set in.

My bees are Italians and are in good condition and very strong, with plenty of brood but scarcely any honey; this has been the poorest year in the 20 that I have been in the bee business. I am delighted with your JOURNAL; could not think of doing without the Weekly, but must beg leave to say that I like the old form better, as I wish always to bind it. The old form is better for the library shelves and is better for the library shelves and for perusal.

Avoca, Iowa, Aug. 4, 1881.

In 1874 he called the bee-keepers in Southern Kentucky together at his residence, where the Southern Kentucky Bee-Keepers' Society was organized, and he was elected the first President of the Society, and was relected for 3 successive years, after which he refused to accept the office any longer. He became the Secretary from that time until it was merged into the State Society, at Louisville, Ky., Oct., 1880. Ky., Oct., 1880.

He was elected President of the Kentucky State Society, in Louisville, and also of the North American Bee-Keep-ers' Society, at Cincinnati, in 1880. For the American Bee Journal.

#### The Rearing and Mating of Queens.

G. W. DEMAREE.

This subject will never grow old and tiresome as long as there is room for mprovement. I have read with much improvement. I have read with inten-interest the several articles that have appeared in the JOURNAL from time to time, giving the methods and expe-rience of the writers, touching this subject. To rear good queens we are subject. To rear good queens we are told that we must select our colony to told that we must select our colony to rear our queens from, and another to furnish the drones to fertilize them, and we are ready for business. This looks quite business-like, and, doubt-less, would answer well enough if the apiarist resided in some secluded spot, where the wing of the honey bee had where the wing of the noney bee had never fanned the air. To say that there are no "black bees in the vicin-ity" does not quite cover the grounds. There are hybrids in every vicinity where both races have existed. Though the black race may long since have been banished, they have left their though the black. blood behind.

With just one colony to furnish drones, their being other drones in the vicinity, the apiarist could just as reasonably expect his queens to be struck by lightning as to expect them to mate, with certainty, with the few drones that his one colony furnishes. Of course such proceedings would answer better very early in the spring and late in the fall, when there are

few drones in existence.
Mr. A. I. Root tells us that he has had queens mated at a time when he could see no drones, and I have seen something very nearly like it myself. If I wanted queens to breed from I would not give much for them after they had taken such a fearful chance for purely mating, unless I could thoroughly test them myself, both as to their worker and queen posterity. At the risk of being charged with heresy, Lavail myself of this opening to say that careful experiment has convinced me that there are not a few queens whose worker posterity are "well-marked" that, nevertheless, bear hymarked that, nevertheless, hear hybrid royal daughters. Hence, if our object is to rear pure queens and bees, we must be on the continual watch for taint of blood. Years ago I introduced, in the vicinity in which I reside, the Italian bees. They were a great euriosity in those days. I set them up somewhat remote from other them up somewhat remote from other bees, and in my innocence of bee knowledge pertaining to the habits of queens in their mating season (though I knew something of bees in other respects), I expected to build up an Italian apiary without any difficulty. went to work to rear queens, and why should I not succeed? I had a fine lot should thousaccered? I had a microid drones issuing from 1 or 2 colonies every day, and was as well off in this respect as those breeders who "select one colony" to produce their drones. Well do I remember my disappoint-ment and disgust when I watched for the first hatching bees of my young queens to find them all hybrids. I concluded that a lottery ticket was about as reliable as a purely mated queen, under the circumstances. Nevertheless, I learned something in the meantime, and changed my tactics. I paid no further attention to the mating of queens, but gave all my atten-tion to pure queens and consequently pure drones. And when the time came that I had pure drones flying from 15 or 20 colonies, my labors be-gan to be rewarded. My queens were mated with pure drones, and it is now frouble for me to rear queens that will bear the test of purity.

If any person will give the subject f mating of queens, the time and attention necessary to get a pretty fair idea of the habits of queens and drones in their mating season, his faith in "3" faint bands and purity of blood generally will certainly undergo some diminution. A week ago 1 undertook to watch (as I have often done) a fine young queen, and see all that could be seen in connection with her wedding flight. I found her to be a consummate flirt. Notwithstanding the

air was ringing with the hum of thousands of bustling drones, this queen made 8 trips into the air, aggregating about 70 minutes of time. On her last tour she was gone 25 minutes; her bees became very restless, and 1 "trembled" for her safety, but she gladdened the hearts of the ushers at the threshhold by flaunting her wedding certificate as she entered the "queen's palace."
Christiansburg, Ky.

From Payche.

#### Insect Life During Winter.

PROF. A. J. COOK.

The condition of our vertebrate animals in winter, and also the functional condition of their organs, have been well studied and are pretty well understood. That most of them require more carbonaceous food at this season, as this ministers to the special kind of nutrition which supplies animal heat, is a well recognized fact. It has long been known that some vertebrates hibernate, in which state they respire very slowly, and so are able to live even though the heart does circulate unoxidized blood.

The functional activity of the or-The functional activity of the organs in this case is reduced to the minimum, and so nutrition is almost abated, and no food is required other than that stored up in the adipose tissue. But even though these animals do live so slowly, with too severe and long continued cold they often lose even this little right; and register. even this little vitality and perish.

Physiologists have determined that tissues and organs, whether in situ or tissues and organs, whether in situ or removed from the body, will maintain their vitality for a long time, and often indefinitely, if kept in a cold atmos-phere, though all functional activity is for the time held in abeyance. I myself have exposed hense ggs, while mysen have exposed nens eggs, while in the process of incubation, to a tem-perature little above 0 °C, until I had good reason to believe that the hearts of the embryo chicks had ceased to beat. I then replaced the eggs under the brooding hen, when with the rethe brooding hen, when with the re-turn of heat came also a resumption of development. Very likely the same explanation may rightly account for the retarded development in many tadpoles that pass the winter in an immature state. Most frogs develop fully in summer, and pass the winter in a mature state. Yet we not infre-ments for tabloder in mid-winter quently find tadpoles in mid-winter, or large ones at the very dawn of

spring.
If all animals have had a common biologist doubt it?), origin (andean any biologist doubt it?), we may expect that the phenomena observed among invertebrates will closely resemble the peculiarities which we note in our study of the bights formed. higher forms.

The effects of cold to stay or retard development among insects, though perhaps not so long and closely studied as have been the same influences as they worked to modify development among the vertebrates, will be found, feel quite sure, to act in a very simiilar way.

The winter of 1874-75 was one of the The winter of 1844 to was one of the most severe ever experienced in the northern United States. In the month of February of that year, the temperature tell below zero of the Fahrenheit scale (-417, 8 C.), at Lansing, Mich., twenty-one times. The mer-Mich., twenty-one times. The mer-eury showed—20 F. (—28, 9 C.) on 8 different days, and—30 F. (34, 4 C.) twice. Surely this was a good time to study the effects of cold on insect life.

The codling moth insect (Carpocapsa The codling moth insect (Carpocapsa pomonella), as is well known, passes the winter in the larval state, protected only by a slight silken cocoon, and some bark scale, crevice, or similar covering. The spring following the severe season just referred to I found that nearly all these larvae that had passed the winter out-doors about the apple trees were dead, a circum-

kitchens were healthy and lively, points tion of fecal matter within the intesstrongly to the severe cold as the of this welcomed mortality. If this inference is correct, we must conclude If this that insects which freeze up in winter may succumb to very severe cold.

Farmers long since observed that clover sward ploughed in autumn, and clover sward ploughed in autumn, and planted to corn the following spring, was less liable to be attacked by ent-worms, than when ploughed in spring, and immediately planted. This has led to the very general belief among farmers, which view is adopted by several noted entomologists, that ex-posure to the cold, especially to alter-parts freezing and thawing is what denate freezing and thawing, is what destroys the cut-worms. During the stroys the cut-worms. During the very severe winter already referred to, I subjected some cut-worms—larvæ of species of Agrotis—to intense cold, and to alternate cold and heat, which seemed in no wise to injure them. et passed the winter in safety farmers are doubtless correct in thinking that fall ploughing is a protection against these marauding cut-worms; against these marauding cut-worms; but wrong in their explanation. Exposure to insectiverous birds and not to cold is the more probable solution, especially as frequent cultivation of the land in autumn and spring, when hirds are plenty, is found to greatly augment the destruction of insects.

The late Mr. Quinby, in his work on bookleaping states that the large of

bee-keeping, states that the larvæ of the bee-moth (Galleria cereana) cannot survive exposure to the cold; that if these larva are removed from the hive and its genial heat, during the winter, they surely die. Mr. G. M. Doolittle reports that he has observed these beemoth caterpillars in exposed positions, and that they have survived even the present rigorous winter of 1880-81, have often noticed these larva and the chrysalids, which have passed the winter in cold rooms outside the hives Still from the natural surroundings of these insects we may easily believe that they have developed a constitu-tion more susceptible to the cold than insects whose habits bring more exposure.
Mr. W. H. Edwards has shown how

the development of butterflies may b retarded by the cold. The bearing of these experiments upon the formation of different broads of a species and characteristic markings of each brood

characteristic markings of each proof is of very great interest.

Among honey bees of the genus Apis, we note peculiarities in respect to cold, which, like their habits and instincts, seem to separate them widely from most other insects, and strongly remind us of the vertebrates.

Most insects freeze no in winter so Most insects freeze up in winter, so that all their functional activities are held in abeyance, ready to start into held in abeyance, ready to start into action at the touch of revivifying warmth, which ever comes with returning spring. A few of the higher ones really hibernate. There is a slight activity of the tissues which is sustained by the stored-up fat cells of the body. The species of Apis, on the other hand, remain active, take tood, and resemble more closely the higher vertebrates. In a nearly uniform temperature of from 3 to 8°C, the domestic honey bees remain very quiet, take but little food, and only move as the cold ontside of the cluster impels them to crowd towards the center, or as the absence of food in center, or as the absence of food in any part of the hive impels the whole cluster to change its position. If the temperature outside the hive is maintained within the limits mentioned above, the bees will eat so little, and there will be so little dis-assimilation in the body, that all the excrementitions substances, except such as pass off with the breath—and—this is very slight at such times—are easily and safely held in the intestines for so long a space as 5 or 6 months. But long a space as 5 or 6 months. if the temperature immediately without the hive is for any considerable period lowered much below the point the apple trees were dead, a circumstance I have never observed at any other time. The fact that this mortality was not due to parasifes, that there was no climatic peculiarity during that winter other than the cold, especially as the larvae in cellars and This leads to an excessive accumulation.

tines, which consists of the undi-gested food and the waste products which are the resultant of functional activity. In this condition, bees must soon tly forth to void their feces, which in normal circumstances they only do on the wing, or soon they will be at-tacked by fatal dysentery. The above tacked by tatar dysentery. The above is undoubtedly the rightful explananation of the exceeding mortality among bees the past winter. In many parts of the more northern States, bees have been confined to their hives for 5 months, and in almost all cases where they have not been protected from the severe cold, they have died. Those wintered in snitable cellars are safe and healthy, and many protected out-doors by a thick wall of chaff about their hives are sayed from death. I have found by weighing the honey in the fall and in the spring, that bees kept in the right temperature during the past winter have consumed never the past winter have consumed never more than 10 pounds (4 Kg. 5) of honey to the colony, while all colonies exposed to the severe cold have taken twice that amount. The former wintered well, the latter have sickened and died.

If bees are confined in winter, and the temperature be raised much above 10 °C., the heat becomes a serious irritant, and the bees unless their hives are very well ventilated, and unless they are soon enabled to fly out from

they are soon enabled to fly out from their hives, will speedlify die.

It is an interesting fact that bees require only the carbo hydrates for food in winter. They will winter better on clear honey or even pure cane sugar than when well supplied with the nitrogenous pollen. I think the reason of this is, that in the first case they are prevented from the activity they are prevented from the activity which follows upon brood-rearing, and breeding can only be carried on when there is pollen in the hive.

We see then that our honey bees are not dormant in winter, but that, in our colder climates they are Othello-like, and with their occupation gone; and shut in by the rigor of the season, they only eat the small amount necesary to the bated activity of their bod-

ily functions.

For the American Bee Journal.

#### Top Storing, Separators, etc.

GREINER BROS.

Since writing, July 2, our bees have changed the programme materially. When the basswood began to secrete honey, about the middle of July, they went to work in the top sections in good earnest, and with partially filled sections from the sides as induce-ments, they have done and are doing a remarkable season's work. We have a remarkable season's work. We have tiered up 3 and 4 half stories, each of from 30 to 32 pounds, on many of our colonies, besides the finished sections we have taken from the sides. Of comrse we cannot yet give a report of the season's crop; honey is still coming in, and is likely to continue for some time, for buckwheat has hardly commenced.

On page 231 Mr. Heddon explains why bees do and do not attach to different materials; his theory sounds right enough, but does not stand investigation. We claim, and Mr. Heddon will agree with us, that the material has little to do with the attaching of much local basis in the standard of of comb, bees being incapable of doing so, on account of hardness of material, is argument only. If Mr. Heddon will look around and see how nicely bees attach the edges of combs in 4-sided glass boxes, how solid they brace up things in glass dishes, such as fruit jars, tumblers, globes, etc., a material at least as hard as tin or a coat of paint, he will hardly claim that their incapability tends to make tin better suited for separators than wood. By Mr. Root's recommendation we painted, the first season, about  $\frac{1}{2}$  of our separators; we could not see any difference, and as plain wood gave such complete satisfaction, we never registed thereof the

painted thereafter.

What keeps bees from attaching combs to separators is "nature's in-

your guides away or turn them square against the separators, and they will find as good a chance to attach their first scale for a brace on tin as on wood, or any other material. Nature seems to teach them that small quantities of honey, such as is stored in the commonly used sections of the present day, are sufficiently supported by being attached at the edges. We often find the side combs in the brood chamber attached sidewise; the combs being attached sidewise; the combs being large and generally filled to a great extent with honey, bees deem it necessary to strengthen them by attaching braces to the sides of the hives.

Naples, N. Y., Aug. 8, 1881.

For the American Bee Journal.

#### Barren Co., Ky., Convention.

The Barren Co., Ky., Bee-Keepers' Society met at Allen's school house, July 30, 1881, pursuant to adjournment. The President called to order, and the minutes of the last meeting were read and approved. The roll were read and approved. The roll was called, and several names were added. The following subjects were then discussed:

#### The Best Method of Protecting Bees in Winter.

N. H. Holman said that bees should always have protection of some kind; he preferred to put a box over the hive 4 or 5 inches larger each way than the hive, leaving the entrance open, with straw well packed between the box and the hive, and well covered to

keep dry.
J. W. Scrivner had frequently lost bees for want of winter protection, and would advise protection of some

kind.

II. C. Davis would recommend putting the hives on a bench or platform, 6 or s inches high, facing the southeast; putting up boards or planks on the northwest, for wind-breaks; then pack with crab grass all around and under the hive, except the front, con-tract the entrance, cover the hive well to keep it dry, removing all combs from the top story and fill up with old clothes, rags, or chaff cushions. This should all be done early, before winter

sets in.

Dr. Allen preferred wintering on the summer stands. He protects his bees by keeping them strong in numbers with plenty of stores, with chaff cushions on the quilts in the upper story; he lost one out of 40 last winter.

#### When and Hew Shall We Feed ?

J. T. Gray never had to feed much;

J. T. Gray never had to feed much; his bees generally had stores enough to winter on, but would prefer feeding good sealed honey, if they have not honey sufficient for winter.

H. C. Davis: If bees have less than 20 pounds of honey to the colony they should be fed on sugar syrup in the fall, after storing ceases, by placing syrup in an oyster can, with the top covered with muslin, turned bottom upwards on the frames.

Dr. Allen had learned to make his

upwards on the frames.

Dr. Allen had learned to make his bees self-sustaining by feeding them sealed honey, beginning about the last of February or the 1st of March, and continuing until honey is plenty in the flowers, on honey removed from the hives the fall previous, for that

purpose.

The President then appointed as ourpose.

The President then appointed as committee on apiarian supplies, J. M. Holman, R. J. Parker and W. V. Greer; and on subjects for discussion at next session, J. H. Adams, H. C. Davis, N. H. Holman and J. W. Scrivner. On motion the meeting adjourned.

At 2 p. m. the President called to other sub-the apparatuse on aniarian.

At 2p. m. the President cannot to order and the committee on apiarian supplies reported the following articles on exhibition: Two samples of honey by Dr. Allen (peach and white clover); the clover honey is of superior quality both in color and taste;

clination and man's ingenuity; "leave also one by 1. N. Greer, which was your guides away or turn them square very vice; a lot of Bingham smokers, against the separators, and they will which we consider the best in use; which we consider the best in use; once of Peet's introducing cages, exhibited by Dr. Allen, recommended to be good for the purpose for which it is intended; one case of bees by I. N. Greer, which we consider nice Italian bees; this race of bees we recommended to be interesting to the property of the second o ian bees; this race of bees we recommend as being in every particular superior to the old race of black bees; copies of the American Bee Journal, also Gleonings, both of which we take pleasure in recommending to bre-keepers. J. M. Holman, R. J. Parker, W. V. Greer, Com.

On motion the report was adopted and committee discharged.

The committee on subjects for discussion at the next session reported

The committee on singects of dis-cussion at the next session reported the following: 1. What is the best plan to prepare bees for winter, to prevent dysentery in the spring? 2. Which is better, natural or artificial swarming? 3. Would it be profitable for every farmer to keep 10 or 12 colonies of bees, or is there any fear of being over-stocked? 4. Which is the most profitable, extracted or comb honey? J. H. Adams, N. H. Holman, J. W. Scrivner and H. C. Davis, Com. The report was accepted and the committee discharged.

#### Hew to Prevent Drene Breed.

J. H. Adams said, keep all drone

omb away from the brood-nest.

H. C. Davis said, to prevent bees from building drone comb they should be supplied with worker foundation.

#### Can We Manage Bees so that the Moth Werm will not Destrey Them?

J. II. Adams said since the intro-duction of the movable frame hive bees could doubtless be kept free from moth. If we keep Italiaus or hybrids and keep them strong, we shall have no trouble with moth; if we have them in our weak colonies, we can raise the frames and kill them.

II. C. Davis: The best plan to prevent moth is to remove all combs not

occupied by the bees, and, if necessary, smoke them and give them back

to the bees just as fast as they need them, but no faster.

The President then stated that the Kentucky State Bee-Keepers' Convention would be held in Louisville on Oct. 12, and appointed J. H. Adams and J. M. Holman as delegates to attend that Convention. Dr. Allen tend that Convention. Dr. Allen then delivered an interesting address on the pleasures and profits of beekeeping

keeping.

The following resolutions were then read and adopted: Resolved, That the thanks of this Society be tendered to the citizens in the vicinity of Allen's school house, and especially the ladies, for their excellent entertainment. Resolved, That the proceedings of this Convention be published in the Glasgow Trues Faguers' Hame Journal and

Convention be published in the trans-gow Times, Farmers' Home Journal, and the BEE JOURNAL.

On motion, the Society then ad-journed to meet on the first Saturday in April, 1882. The place of meeting was not designated, but is to be pub-lished in time for the meeting. lished in time for the meeting.
1. N. GREER, Pres.

#### J. M. HOLMAN, Sec.

Bee-Keepers' Union.—The Eastern New York Bee-Keepers' Union Association, will hold their eighth semi-annual Convention on Tuesday, Nov. 29, ISSI, at 10 a.m., at Knowersville, N. Y. All bee-keepers are invited to attend. W. D. WRIGHT, Pres. N. D. WEST, Sec.

The Northwestern Bee-Keepers' The Northwestern Bee-Keepers' Association will meet in Chicago, on Tuesday and Wednesday, October 25 and 26. All bee-keepers are cordially invited to attend. It is desired to make this one of the most interesting conventions ever held in the United States. C. C. MILLER, M. D., Pres. C. C. COFFINBERRY, Sec.

The Eastern Michigan bee-keepers Association will hold its fall meeting in Detroit, Oct. 4, in the Y. M. C. A. hall, at 10 o'clock a. m. A. B. WEED, Sec.

### TWELFTH CONVENTION

### North American Bee Keepers' Society

TO BE HELD IN THE Odd Fellows' Temple, Lexington, Ky.,

#### WEDNESDAY, OCTOBER 5, 1881.

Lexington, Ky., being a central point, the Executive Committee hope to have a large attendance from the North, South, East and West, and from Canada, and that the 12th annual meeting of the North American Bee-Keepers' Society will be the most in-teresting meeting that the bee-keepers of the United States have ever held.

#### Notice to Vice Presidents.

I desire to say to the Vice Presidents of the North American Bee-Keepers Society. the North American Ber-Krepers' Society, that I wish each one would send me a report of bees and honey in their respective States, as it is customary for the Vice Presidents to make such reports at the annual meeting of our Society. I hope that none of them will fail to do so. I would be glad to meet them at the Convention, and become personally acquainted with them. Programmes will be sent to them for distribution to the bee-krepers of their States.

N. P. Allen, Pres.

#### Report of Committee of Arrangements.

Report of Committee of Arrangements.

The Convention will be held in the Odd Fellows' Temple, East Main Street, between Market and Mulberry Streets.

The special reduced rates at hotels are as follows: St. Nicholas hotel, directly opposite the Odd Fellows' Temple, \$1.40 per day: Ashland House, \$1.50 per day; Sww Phenix hotel, \$2.50 per day (regular rafe). All of the above are first-class hotels. Parties desiring private board, at \$1 per day, can address a postal card to W. Williamson, Lexington, Ky.

Railroad fares are as follows: C. H. & D. Railroad, to Cincinnati; Dayton & Michigan, to Cincinnati; Checinnati, Richnond & Chicago to Cincinnati, Richnond & Chicago to Cincinnati, Cleveland, Columbus & Indianapolis,—all fulfare one way, one cent per mile returning. Cincinnati Southern Railroad, Cincinnati to Lexington and return, \$4; all intermediate or local stations \$2\frac{1}{2}\$ cents per mile each way; from Chattanooga to Lexington and return, 2 cents per mile each way; Kentucky Central Railroad and Lexington & Big Sandy Railroad, all stations between Cincinnati to Lexington and Mount Sterling and Lexington, \$2\frac{1}{2}\$ cents per mile each way; Louisville C. & Lexington R. R., \$2\frac{1}{2}\$ cents per mile each way; and the limit of the convention meets the Exposition in Louisville will be in full blast, and you can take advantage of the low rates made to the Mammoth Cave at that time." The regular rates to parties of \$25\$ is \$5.50 for the round trip; but nodoubt the excursion rate will be far below this figure. When a party of 10 is formed, the hotels and proprietors of the Cave make a reduction of \$25\$ per cent. off regular rates, which are: Hotel, \$3 per day; Grand Route in Cave, nearly 20 miles, \$3 each, including guides, etc.; Stort Route, nearly 8 miles, \$2; Chief City, 5 miles, \$1; Mammoth Dome, 3 miles, \$1; White's Cave, 2 miles, \$2; Chief City, 5 miles, \$3 each, including guides, etc.; Stort Route, nearly 8 miles, \$2; Chief City, 5 miles, \$3 each, including suited to attend the Ky. State Bee Keepe

Those sending articles for exhibi-Those sending articles for exhibition will please prepay freight or express charges, and send plain directions how to be returned; if desirous of selling them, attach a card stating the lowest price in plain figures. I will cheerfully and impartially attend to exhibiting queens, bees, hives, and other implements for the apiary, of any kind, free of charge. I will exercise all due care, but will not be responsible for losses of queens or bees by death or accident. WM. WILLIAMSON.

#### PROGRAMME.

#### WEDNESDAY, OCT. 5.

MORNING SESSION.

10 to 12.—Convention called to order.

10 to 12.—Convention called to order. Reading minutes of the last meeting. Reading of correspondence. Calling the roll of members for last year, payment of annual dues, receiving new members, and distribution of Badges. President's Annual Address. Reports of Secretaries, Treasurer, Standing Committees and Vice Presidents.

#### AFTERNOON SESSION.

t to 5.—Appointment of committee to nominate officers for the coming year, to report Thursday morning.

### Addresses to be Followed by Discussion.

The New Bees—
Prof. A. J. Cook, Lansing, Mich.
Foul Brood among Bees—
C. F. Muth, Cincinnati, O.
Can Honey be made a Staple Product?—
C. C. Coffinberry, Chicago, Ill.

## THE AMERICAN GIESTAL ON CO. BEE JOURNAL

#### THOMAS C. NEWMAN.

EDITOR AND PROPRIETOR,

CHICAGO, ILL., AUG. 17, 1881.

Maple Sugar .- Mr. W. F. Standish, Evansville, Wis., gives the following incident:

Quite a large number of pails of "Vermont maple sugar" were sold in this village last spring. It being only 14 cents a pound, I bought one to melt up for syrup; but on melting it makes a sickish-tasting liquid, which has a thick, cream-colored We cannot use it, and a half pail of the "sugar" now stands in the cellar. It is fermenting and souring. Whether it is sugar or glucose, I want no more of it. I have no doubt that it would

The trash you have purchased for maple sugar is evidently the commercial article-about seven-eighths glucose. It is a "favorite" with the adulterators, because it is so profitable. That "it kills" thousands of children every year does not trouble their consciences-"It is business, you know, and we cannot help the results; if we don't do it some one else will." This is the excuse we heard offered for such diabolical action, only a few hours

We have received No. 1 of a new paper, published by H. A. Poole, Mechanic's Falls, Me. It is called the "New England Bee Journal and Home Gazette;" 4 pages are devoted to beeculture and the other 4 to home matters, news, etc. The Gazette has our best wishes for success in all earnest endeavors to assist in elevating the science of bee-culture in New England and elsewhere.

Local Fairs.—Bee-keepers attending fairs this fall should have a few bee-keepers' manuals, etc., with their exhibits. When taken in ½ dozen lots by express, for this purpose, we will supply any or all kinds, or one or two of each to make the half dozen, at 30 per cent, discount. If wanted by mail, add the postage. We do not send any "on sale or return." We will furnish eopies of the BEE JOUR-NAL free for distribution at fairs.

of the article on "An Assistant for the Apiary," read "The top of this tool box is hinged," instead of shingled.

A single number of the Weekly BEE JOURNAL is often worth more to a bee-keeper than a whole year's subscription costs. Read what those who have taken it for years say on several pages of this Journal.

We have prepared a SPECIAL edition of the BEE JOURNAL, just as it will be published in 1882 (16 pages), for distribution at Fairs, Conventions, etc. Any one who may desire to distribute them to bee-keepers will be supplied free, in any quantity they may be able to judiciously use.

#### Marketing Extracted Honey.

Mr. Wm. C. Carson, Addison, N. Y. asks for information concerning the marketing of extracted honey, and where he can obtain tin pails or cans, if such are suitable.

This is an important matter, for a good article, attractively put up, will always command the best price, and it is, therefore, of the utmost importance to producers to have honey put up in the best marketable shape.

Of glass honey jars there are two sizes, those holding, respectively, one

Glass Honey Jars.

or two pounds; these are very convenient and attractive for small consumers. Some also use the large glass jars, but we do not think they are as good as tin pails, such as are sold by Ch. Dadant & Son, for several reasons. We give the following from the pamphlet entitled "Extracted Honey," by Ch. & C. P. Dadant:

Having failed to succeed in the sale of honey in glass jars, on account of the regular granulation of our honey and its unattractive appearance in glass, since it looked like butter, or lard, or even worse, we concluded that the only thing to be used for small retail packages was tin. Small wooden

A Nest of Tin Pails for Honey.

packages were tried, and found inadequate, as the honey soaked or leaked, more or less, through any of the cheap packages that we could provide, unless they were coated with wax, which made them too expensive. But tin was entirely successful. We already had the 10-pound pail, but this was too large for a very large retail grocery trade. We had a 5-pound pail take it.

made, which, though half of the former, was still found too large. A pail half of this was then made. It was a pretty little thing—a real toy—and took well. But this was not small enough for some customers, and at the request of several grocers, we disthe request of several grocers, we divided it again, and now had a box of 114 pounds.

Mr. Heddon used earthen crocks holding about 10 pounds, and he likes them very well; it is very convenient to take the honey from them when it is candied, or to liquify it by placing the crock in warm water.

For larger packages we know of nothing superior to the spruce or pine kegs. Of these there are 3 sizes, holding, respectively, 50, 100, and 160 When compared pounds of honey. with large barrels, holding from 300 to 500 pounds each, they are fully as cheap and often cheaper. They need no waxing, but should simply be thoroughly scalded with boiling water before being used. The leakage so often occurring in the large hard-wood barrels can be entirely prevented by using spruce kegs. Considering the cost and trouble of waxing, the loss of honey by leakage, and the ease with which these kegs can be handled and shipped, with an actual saving in original cost, it is apparent to all that they are the best. The smaller packages (jars or pails) should be labeled, and made attractive.

It is gratifying to know that during the present season extracted honey has been produced to a much larger extent than ever before. Without saying anything to the disparagement of comb honey, we may say that we think it will become a staple only in the ex-

Small Kegs for Honey.

tracted form. Its excellent qualities, when it is better understood, will bring it into almost universal favor.

Every bee-keeper should fully supply his own locality, and he should let it be distinctly understood that it is the pure honey taken from the combs by centrifugal force—that nothing is added to it, and nothing taken from it but the comb-that it is not the oldfashioned "strained honey," which was obtained by being taken from smashed brood-combs, and "strained" from dead bees, pollen, etc., but that it is the pure liquid gathered from the flowers, which will give health to the body, force to the mind, and strength to the intellect of those who use it.

It should also be kept before consumers that granulated honey can be reduced to its liquid state in a few moments by placing the honey in a jar in When thus liquified warm water. it so remains for some time before again crystallizing. Consumers may be sure of a wholesome article by ourchasing granulated honey and reducing it.

It will pay to devote a few hours in getting up a club for the BEE Jour-NAL. Read the list of premiums on this page. Every bee-keeper should

#### Lecture at St. Joseph, Mo.

We have consented to give a lecture on "Bees and Honey," at the Court  $House \ in \ St. Joseph, under the auspices$ of the apiarian department of the St. Joseph (Mo.) Inter-State Exposition, on Thursday, Sept. 8, 1881, at 8 p. m. R. S. Musser, Esq., the Superintendent of the department of apiculture, seems determined not only to have a very fine display of bees, honey, apiarian implements, etc., but also to try to elevate the science and beget a progressive spirit in the honey producers of the Missouri Valley.

We hope to see a large number of the intelligent bee-keepers of the Missouri Valley at this meeting; we shall endeavor to elucidate many points of interest to those who keep bees and produce honey. Let there be a general rally.

We have been solicited to lecture on apicultural matters at several points in Iowa, Nebraska, Kansas and Missouri, but shall be unable to do so this fall, as we have other engagements.

The Honey Harvest of Switzerland. The Bulletin DApiculteur, published by Mons. Bertrand, in Nyon, Switzerland, has an extended review and copious extracts from the pamphlet on Extracted Honey, by C. H. & C. P. Dadant. In a privale letter, the editor of that paper remarks as follows:

We have had a very hot summer, with no rain for seven weeks. A few nights since we had several earth-quakes. Such a state of things has not occurred since 1793. On account of the cold winds in April and May, our early crop of honey was only oneonly early crop of noney was only one-half of the average; but our mountain crop will be very good. I expect this year to obtain only about 3,000 or 3,500 pounds in my three apiaries.

Mr. Bertrand (our friend and colaborer) is one of the most scientific and progressive apiarists in Europe. He manages his bees in true American fashion, and closely watches all our improved methods in bee-culture and for obtaining honey. Headds: "The Weekly BEE JOURNAL (though it is a monthly when it comes to me) pleases me very much, and I could not do without it. It is, for me, THE STANDARD."

Honey and Bee Show in Canada.-At the Toronto Industrial Exhibition, Sept. 5-17, prizes for "Honey and Apiarian Supplies" are to be given to the extent of \$115, besides two medals and six diplomas.

The Planters' Journal, published at Vicksburg, Miss., is one of the finest monthlies in the United States. The August number is a model of perfection, and a credit to "the art preservative." We wish it abundant

Premiums.—Those who get up clubs for the Weekly Bee Journal for 1882, will be entitled to the following premiums:

For a Club of 2,—a copy of "Bees and Honey."

3,—a Binder for 1882.

4,—Cook's Manual, paper.

5,— "cloth.

6,—Weekly Bee Journal for 1 year.

- The Ninth Grand Exhibition of

Art and Industry will be open for the reception of articles on Wednesday, Aug. 17. to Tuesday evening, Sept. 6. Open to the public from Wednesday, Sept. 7, to Saturday, Oct. 8.

#### Unbusiness-like Transactions.

Having received many complaints from the patrons of H. A. Burch & Co., concerning very long delays in filling orders, and broken promises, we have written them many times, urging them to more punctuality. We desired not to unnecessarily bring these matters before the public, preferring to get them settled in a private way, but the complaints became so numerous that on August 1 we wrote that firm, entreating them to satisfy their patrons, and added:

It will not do simply to say Mr. B. as been sick; there is a "Co." who has been sick; there is a should see that things move along should see that things move along right, and satisfy customers. You as-sured me before I commenced to ad-vertise for you (in February, 1881) that you would "fill all orders promptly," or should not have inserted your advertisement.

We give Mr. Burch's reply in full, as follows:

EDITOR BEE JOURNAL: In answer to yours of Aug. 1, I will say that we regret exceedingly that you should be "annoyed" by complaints of us and our business. The loss of our bees last spring was a heavy blow to us, financially, necessitating purchasing largely to fill our orders. This put us back some-what, although June 1 found us re-stocked and in shape to begin busi-ness in earnest, but 2 weeks of cold ness in earnest, but 2 weeks of cold weather in June delayed us still more. Then it came off very hot, and bees swarmed to such an extent that we could do little shipping during the re-mainder of the month. Then the hives were crowded with honey, which had to be extracted before bees could had to be extracted before bees could be safely shipped any distance. This made it very slow work indeed, and as we were unable to procure sufficient suitable assistance, we got further and further behind. Notwithstanding, I have worked day and night for the past 3 months, having nearly ruined my eyesight writing nights, we are still behind. We are still shipping bees, but it goes slowly; have returned all the money we can at present, so much so that we have not enough left to meet our bills. Now, had to be extracted before bees could enough left to meet our bills. Now, to sum up, we have done all we possibly can for our customers, and if you can suggest any better plan than that of keeping steadily at work and working out of the dilemma, we should be grateful.

very grateful.

The course pursued by Novice, and other parties, has materially delayed us, as many parties have obtained the us, as many parties have obtained the idea they would lose their money, and we have been more than "annoyed" by their threats and importunities. You can perhaps imagine how one feels who is behind, yet honestly striving to do his utmost to be just to all, to be misrepresented as we have been. Now do with us just as you think right. If you feel like saying in the Ber Jouryou feel like saying in the BEE Jour-NAL that you regret our being so much wal that you regret our being so much behind, but are assured that we will make all satisfactory so far as lies in our power, we shall feel grateful. My partner has been away since last February. Will remit amount of your bill at earliest date we can do so.

II. A. BURCH.

We are well aware of the troubles that came from the losses of bees, and unpropitious weather for queenrearing, but the complaints cover the filling of orders for sections, comb foundation, etc.

In all cases, where orders cannot be filled in a reasonable time, the money should be cheerfully refunded. Mr. B. asks if we can suggest some better plan than the one be is pursuing. If he has used the money belonging to his patrons would it not be better to borrow enough money on his bees, supplies, stock, farm, or whatever he has, and pay back those whose money in the state—and this was and the state and the state—and this was and the state—and the state

he has used for other than the purposes they sent it, and that, too, without their knowledge or consent?

We have no desire to injure anyone especially any who are trying to do right, and hence we have labored long and earnestly with H. A. Burch & Co., for their own benefit, urging them to \$1125.00. Can a man and a boy do make peace with their patrons, and this raising cotton. we do hope that they will act promptly and save their credit as business men.

Not wishing to burden the JOURNAL with the detailed complaints, we omit them, and simply refer to them in bulk.

#### MISCELLANEOUS.

Bees and Cider.-Mr. L. C. Root in the American Agriculturalist says:

Another correspondent suggests that the losses in bees during last winter were largely due to the fact, that from the great abundance of apples, bees appropriated cider quite extensively during the fall. It is unquestionable that the juice from such quantities of decaying fruit, as well as the cider gathered in the vicinity of cider mills, would have a deleterious effect upon While this can hardly be considered as the main cause of our heavy losses, all will agree that all conditions must be most favorable during such severe weather, if success is to be attained. Good, well cured and sealed honey is essential, and where cider is gathered in abundance late in the fall, this condition can hardly be secured.

Use for Propolis. - Mrs. L. Harrison, in Gleanings, says:

I use it in many ways, and there is scarcely a day that I do not use it in something. I noticed yesterday, that bees were in a cap of a hive, and on examining found that they came in through a hole in a honey-box. I got some propolis, worked it up soft with my fingers, and spread it over the hole. If I saw off a limb of a tree, I cover the wound with it to keep out insects and wound with it, to keep out insects and rain. If the dipper leaks, it is soon mended with it, and the wash-basin can be cured of its leaky tricks by havcan be cured of its reaky tricks by having a thin coating rubbed on the bottom. Old pans and dippers, used for dipping slops and feeding chickens, would be much better, if their holes would be much better, it their holes were mended in this way. Some roofs leak around chimneys, which can be stopped by rolling up propolis into little rolls, and fitting it nicely into the crevices, so that the shingles and bricks are glued together, leaving no cracks for water to run through.

Some have parasols or umbrellas with a carved fish or dog's head on the end of the handle for ornament. We end of the handle for ornament. We have one, and on the 4th of July our dog's head came off; We worked dog's head came off; We worked some propolis then, and wrapped the handle in it, and put on the dog's head again, cleaning off all propolis that oozed out, after pushing it on. To-day we tried to pull it off, but it was no go; it measures as it is had grown there it was just as if it had grown there. Who will try propolis for budding and grafting? LUCINDA HARRISON.

Peoria. Ill., July, 1881.

Good Report from Texas.—The Texas Agricultural Journal, a new Monthly published at Hempstead, Texas, gives the following report from Mr. B. F. Carroll, of Dresden, Texas:

I had twenty colonies to commence out, in the state—and this was all. I increased to 53 colonies by artificial swarming, and have a surplus of 100 pounds per old colony. My best colony

produce as much, in donars and cents, as 2 acres of cotton. One man and a stout boy can attend 150 colonies. These will average 50 pounds, one year after another, and at 15 cents, gives

In the neighborhood of Waxahatchie 1 found 600 colonies of bees, and in my neighborhood about 300. All doing regular out colonies of bees, and in my weighborhood about 300. All doing well; mostly blacks. I have now on my yard Cyprian, Syrian, Italian, German and Hungarian Bees. I cannot et tell which are the best—they are all good.

Honey Show for Canada.-The Cauudian Farmer advises the Ontario Bee-Keepers' Association to offer a variety of premiums for honey at the exhibition, at Toronto, this fall, and

A prize should be given for extracted honey done up in the best marketable shape in glass, tin and wood. Comb honey might be divided into three classes, box-honey, section-boxes, and whatever other form may commend itself to the judges. This would give scope for much variety. In addition to the above there should be prizes for implements for apiarian use and also for fruit preserved in honey, as well as for fruit preserved in honey, as well as other things in the manufacture of other things in the manufacture of which honey is employed. We trust that the display this season will far surpass that of any previous year both in the number of exhibitors as well as the variety of forms in which the honey is presented, so that the public may be made to feel the importance of this infant industry and encouraged to assist in its firther development. One of the principal objects of the association is to show the advantage the country may derive from greater attention being paid to bee-keeping, and in no way can this fact be brought home to the general public so forcibly as by the members uniting to make the display in the apiarian department of the exhibition a grand success.

Superiority of Italian Bees.—Mr. J. B. Mitchell in the Hawkinsville (Ga.) Dispatch says:

Their good qualities are now con-ceded by all who have tried both vari-eties under similar circumstances, and they are rapidly taking the place of the blacks in all parts of the country.

the blacks in all parts of the country. They are more active than other bees, making three flights in the time that the black bees make two; they are more hardy, working earlier and later, and in cooler weather; they gather honey from flowers which are not frequented by black bees; their queens are more prolific, so that they may be increased much faster with safety; they gather more honey and give more swarms in the same length of time, and are more gentle and of time, and are more gentle and easily handled than black bees.

asny mandred than black bees.
Their chief point of excellence, and one that is worth everything to beekeepers in the South is, that they readily and successfully defend their hires project the depredations of the hives against the depredations of the bee moth. A strong colony of Italians is worth more as a protection sgainst this pest than all the moth-proof hives and moth traps that were ever

A Houseful of Honey.—A Special Dispatch to the Chicago Tribune gives the following particulars of a hive, which is probably large enough to satisfy any one:

Streator, Aug, 4.—A few days ago Mr. Adam Diller, a wealthy farmer living a few miles east of here, had occasion to visit an old dilapidated dwelling that stood on the back of his farm,

\$21.20, or 106 pounds choice comb honey at 20 cents per pound. I can sell all my extracted honey at 15 cents a pound. Three colonies of bees will produce as much, in dollars and cents. the fellows were hard at work filling the cells with the sweet juices. Your correspondent visited the hive last evening, and would judge that there must be at least a ton of honey there. Mr. Diller says he will not disturb them, but will give them full play in their extensive home.

> Importing Queens. -Mr. D. A. Jones, thus describes his method of shipping Cyprian queens, in the Canadian Far-

It is a very difficult matter to import them to this country. The colonies I bought in Palestine I had sent down to the coast, and then forwarded by steamer to Cyprus. There they were transferred from the cylinders into movable frame hives. ders into movable frame hives. ders into movable frame hives. I then made a box about 4x5x6 inches out of pine hunder. I put a screen on the bottom and one in the top, each about 3 inches square, to let the air pass through. In one end of the box I fixed a bottle filled with water, and having a cork through which a cutting was made for a wick. Through this cutting I drew a cotton wick and this cutting I drew a cotton wick, and by capillary attraction this wick is kept wet with water and the bees drink and then eat some granulated sugar, which I fastened upon the other end of the I fastened upon the other end of the box by pouring it in hot and allowing it to cool. Between the bottle and the sugar I had a comb with a little syrup in. There was a queen and from 160 to 300 bees in the box. I had a crate made to hold 27 of these boxes, and they were separated from each other about an inch and a half, so that a current of air always passes around every rent of air always passes around every box. I have some bees that were kept box. I have some bees that were kept 6 weeks in that way, and during the whole time they had but one chance to fly, and that was when I arrived at London. Some of the bees appeared to need this, and others did not. The water was very bad, and I have given instructions that in future consignments the water should be boiled before heing nut into the bottle; this will fore being put into the bottle; this will purity it.

The best course for a man to pursue who wants to keep bees, simply to get who wants to keep bees, shinpy to get honey enough to supply his own family, is to get 5 or 6 hives and read up Cook's Manual of Bee Culture; and if he writes to me I will give him all the information I can. Cook's Manual is decidedly the best manual on bee cultures which has been unblished. ture which has been published.

Prospect for Fall Honey. - The Indiana Farmer gives the following as the prospects for a fall crop of honey in Indiana:

The bees have commenced getting some honey again and in spite of the exceedingly dry weather of the past 6 weeks the prospects for a good fall crop of honey are quite flattering. All sections or boxes that are part full of white honey should be removed, espewhite honey should be removed, especially so where well capped over. Sections partially filled with white honey and finished with buckwheat or dark honey, do not look well, and will only bring a correspondingly low price in the market. If you want to use the sections partially filled with comb, remove the white honey with the extractor, or, in the absence of the extractor, uncap the honey, so in finishing up again they will make the cappings all alike.

The North Eastern Wisconsin Convention meets at Pewaukee, Wis., instead of Berlin, as at first announced. It meets on Oct. 11 and 12, 1881. Those in that vicinity should make a point of attending.

The Southern California District Bee-Keepers' Association will hold its annual meeting in Los Angeles City, Sept. 8, 9, and 10, 1881. All persons interested in bees and honey are

# SELECTIONS FROM

The Cyprian Bees. —I bought an imported Cyprian queen of Mr. D. A. Jones about a year ago, but not being Jones about a year ago, but not being prepared to rear as many queens from her last season as I wished to, I took her to my friend, A. T. Williams, of St. Charles, Mo., who reared from her a number of queens for himself, and 8 for me. This spring I sold the imported queen to him, and he has been rearing a meens from her for helb, of rearing queens from her for both of us all this season. I have now over 50 in my yard, and expect to have one in in my yard, and expect to have one in every one of my 95 hives before cold weather sets in. I like them very much. My experience with them is very different from that of Mr. Hayhnrst. I can handle them as well as the Italians. It is very likely that all the Cyprian queens I now have have mated with Italian drones. It will take 2 or 2 years to tell the role. will take 2 or 3 years to tell the relative merits of the two races.

A. W. Windhorst.

Ferguson, Mo., Aug. 9, 1881.

The Causes of Loss in Winter.—Bees The Causes of Loss in Winfer.—Bees have done remarkably well here since the first blossoms in the spring until within the last 2 weeks. The dry weather at present will seriously affect the fall crop of honey. I have thought of saying something about the cause of severe losses last winter, but so many have hit the point it is hardly worth while. The long continued cold with poor honey is about all that can be said. I think poor timed cold with poor honey is about all that can be said. I think poor honey the main trouble. In some cases the honey soured in the combs; good rich honey will not do that. We had the same trouble 9 years ago, when one of my neighbors lost 72 colonies in an above ground callar where onies in an above-ground cellar, where he had previously wintered success-fully. The honey and pollen soured, and foamed out of the cells. L. C. Whiting.

East Saginaw, Mich., Aug. 4, 1881.

Kingbirds.—Before we commence a war of extermination on these birds we should be sure that they do more harm than good. We recently saw a kingbird alight on the dead limb of a cherry tree and then fly off and catch a rose-bug, which it brought back, and ate a part of it and dropped the rest. It kept this up for some time. We watched it awhile, and counted over 50 rose-bugs that it caught. There were bees flying to and from their bives under the treas but I did not were bees hying to and from their hives under the trees, but I did not see it eatch one. If the kingbirds would do nothing more than to keep the rose-bugs thinned out, so that we could do away with poisoning and picking them off by hand, to save our picking them off by hand, to save our fruit, vines, trees, etc., from its rav-ages, we might well spare a few thou-sand bees, if the birds want them. I think the time spent and money for powder and shot to kill birds with, costs more than the damage they do to the bees. W. C. Jemison. Natick, Mass., Aug. 3, 1881.

Half a trop of Honey.—Bees did well in Jasper county early in the sea-son, but a local drouth has cut the honey crop in two; half a crop is all that can be reported. From 13 colonies, mostly light in the spring, 1 have taken 405 pounds—100 pounds 2-pound sections; the balance extracted. They still have honey enough to winter if they hold their own from this time

the house to sting the good woman, who was quietly sitting in her chair. You cannot look in front of a Cyprian colony without being assailed; you cannot move a block at the entrance without 5 or 10 bees darting to your face. like sparks from fireworks. While extracting, my son received hundreds of stings from them. We do not want any more such bees, even if they were better them. Italian bees if they were better than Italian bees —and this is not proven to be the case. My grandchild was assailed by these furies while standing in front of one of the hives. I hastened to bring him into the house, and was, of course, followed by a cloud of angry bees. After 15 minutes or more, while we were still bathing his head, we were again assailed by these bees, who were angry at not finding their way through the window. They do not know how the window. They do not know how to gorge themselves with honey when you smoke them; they shake their wings, and fly to sting. They act exactly as the Egyptian bees do, and are, no doubt, of the same family.

Chas. Dadant.

Hamilton, Ill., Aug. 5, 1881.

Short Crop of Honey.—Had a poor honey season—not more than \(^1\_4\) the crop of last year, on account of long drouth. Bees have a plenty to keep them through the winter, if they make no more. If it rains soon there will be a good crop of bitter honey this fall.

E. P. Massey.

Waco Tayas Ang. 2 1881

E. P. M. Waco, Texas, Aug. 2, 1881.

The Mint Family.—1 send, by mail, sample of a plant for name. No one The Mint Family.—I send, by mail, a sample of a plant for name. No one here knows what it is. It gives every indication of being a grand honey plant, of long-blooming duration, and we wish the name and its tenacity to the ground given through the BEE JOURNAL.

JAMES HEDDON.

Downging Mich Ang S 1881 Dowagiae, Mich., Aug. 8, 1881.

[This is Brunella vulgaris—self-heal or heal-all. It belongs to the mut family. It is a common perennial, about a foot high, or much less on poor land. I have before received it, as a bee plant, as in fact I have a large number of different species of mints, such as catmint, germander, spearmint, bugleweed, several basils, marjorum, thyme, calaminth, balm, pennyroyal, horse-balm, sage, bergamot, scutellaria, borehound, hedge-nettle. motherwort, dead-nettle, and others. The plant above referred to, is considered quite a weed in some meadows and lawns .- Prof. W. J. Beal, Michigan Agricultural College.]

Honey Crop in California.—This is a poor season for honey; many beemen will do well if they earry their bees through without a general loss. Very few have extracted any this scason, and only in limited quantity.

Mrs. Sarah A. Fahrcheld.

Pomona, Cal., July 21, 1881.

yprian Bees Handsome and Gentle. —My Cyprian queens from Mr. Jones arrived too late for me to get a correct idea of their qualities this season. They are, most certainly, the prettiest bees I have seen, and as gentle as any to handle. —Chas. F. MUTH. Cincinnati, Aug. 10, 1881.

The Honey Harvest.—The very hot weather of the past week culminated, last night, in a terrible wind-storm, they hold their own from this time until winter. M. LEIDY. Carthage, Mo., Aug. 4, ISSI.

Our Experience with Cyprian Bees.—We want to get rid of them as fast as possible. It is impossible to control them. When their anger is aroused you cannot get them quiet; smoke is useless, unless you put sulphur in the smoker. My son opened a Cyprian colony at one of our apiaries; they stung every animal around the apiary, ducks, chickens, etc. They went inside

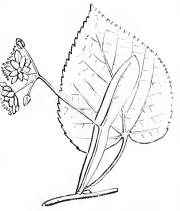

the house to sting the good woman, of rain we will have quite a long fall Weekly is indispensable.

HARRY G. BURNET.

Blairstown, lowa, Aug. 6, 1881.

Basswood, Bee-House, etc.—When is the right time to plant basswood, and how should it be cultivated? The forests on the creeks are being cut away, and there is none on the Mississippi hottoms. I will give a description of my bee-house, in which I have wintered successfully for 6 or 7 years. Last winter I lost 3 colonies—one a nucleus, one starved, and one with plenty of honey. The house is 16x16 feet, by 10 feet high; studding 2x8 inches; lined with the cheapest lumber; outside boarded up and down; space of 8 inches filled with sawdust; 6-inch square ventilator in north and south end, just above the floor; floor south end, just above the floor; floor 12 inches above the ground; filled below with sawdust; one ventilator in the center; ceiled with cheap lumber, filled in with sawdust, and covered with cheap shingles; door filled. The house is also very landy for summer use. I commenced this spring with 2 colonies, and now have 9. Success to the Bre Journal. J. S. Jackson. Keithsburg, Ill., July 21, 1881.

[Basswood or linden (Tilia Americana) is indigenous to a large portion of the North American continent; growing, often, to a very large size, and vieing with other forest trees in height. It is quite hardy, and grows readily and thriftily from the seed.

Leaf and Blossoms of Basswood.

We have heard of its blooming and secreting honey in 6 years after planting. The seeds should be sown in drills and cultivated for one year, then transplanted, setting from 10 to 14 feet apart each way. It prefers the proximity to water-courses, bottom-lands, and gravelly soils in which water stands near the surface the whole season through. It would be most satisfactory to transplant yearling seedlings from the bottom-lands. It possesses a magnificent foliage, and is a great favorite with the bees.-ED.1

Robhing, a Fine Art.—Taking everything into consideration, we are having the poorest honey season for years past. The season was good from the middle of May until June 20, about 4 weeks. Our bees were not strong enough at the time to do much in the way of surplus. First, too much rain, then excessive hot weather—105-m the shade was not uncommon. To sum it up in a few words, rain, heat, and drouth has shortened our honey season at least 4 weeks. The drouth still continues at this writing (Aug. 9) still continues at this writing (Aug. 9) and we have bees by the bushel to consume the winter stores, and to practice the art of robbing. Cyprian bees are no "sneak theives," they just walk over the dead and the dying like Roman soldiers shed with iron. We hope to sixtling them, but a problem. to civilize them, bye-and-bye.

G. W. Demarke.

Christiansburg, Ky., Aug. 5, 1881.

Immense Yield of Honey from Basswood.—The basswood bloom closed with July, and it has produced one of the largest yields of honey I ever knew. I have 106 colonies in good condition. condition.
Osakis, Minn.

Honey Crop Flush.—The honey crop is flush in this locality. The flow of honey from the linden was fair, and from white clover it was excellent.

J. VANDEUSEN.
Sprout Brook, N. Y.

Short trop of Honey in California.—The honey crop of this State will be short this year. The Weekly Bee Journal is very much appreciated here in California. The universal report is a lattice of the california o port is: "I like it even better than I thought I should." Go on with your improvements; we, out here, will be fully satisfied with your excellent judgment.

J. D. ENAS. Napa, Cal.

Bees Booming.—Bees were booming during July.—all else was at a standstill.

W. P. HENDERSON. Murfreesboro, Tenn.

The Queen's Marriage Flight. -1 saw a queen and drone together a few days ago. When I first saw them they looked to me like a small ball of bees, looked to me like a small ball of bees, moving in the air. They were not over 10 feet high, gradually coming to the earth; they lodged on a weed that had been cut down and was leaning against a fence rail, and separated; the drone flew to the right and the queen to the left. What I saw took place in less than a minute. Our honey yield was not large here although it. yield was not large here, although it was the best honey season for years. Bees were too much reduced in numbers to gather and make it profitable to their keepers. J. T. Wilson.

Mortonsville, Ky.

Bee: Keeping Does Pay Better Than Farming.—About 60 per cent of the bees died in this neighborhood last hees died in this neighborhood last winter; I lost I out of 9, all in box hives on their summer stands improtected. They have now increased, by natural swarming, to 29. I have 7 of them in movable frame hives. I do not know anything about foundation, extractors, or anything else concerning bees, but if I do not get the enthusiasm all taken out of me I intend to learn. My bees are all blacks; they are always hunting for something to quarrel with, but I could manage to quarrel with, but I could manage then without smoke, if I only under-stood what to do for them. There has been a continual flow of honey has been a continual flow of honey here since the 1st of May, and I have a good location for an apiary. If I understood the business I think it would pay better than farming, or anything that I could do.

Blake Baird.

theap Fares.—On the 5th of Oct. (the day the Convention meets) the Cotton States Exposition opens in Atlanta, Ga.; round trip fare from Chicago to Atlanta will be \$15. Tickets good, I suppose, till the close of the Exposition, in December. Now, you see, the bee-keepers in the North and West can have ne excuse on the score see, the bre-keepers in the North and West can have no excuse, on the score of high fare, from attending the Bee-Keepers' Convention. On the same ticket they can lay over at Lexington, for a few days. Just think! only \$15 round trip from Chicago to Atlanta, via. Lexington. J. P. H. Brown. Augusta, Ga., Ang. 6, 1881.

Too Wet or Too Dry.—In May and Jame it was too wet, now it is too dry for honey gathering. Bees are storing a little from buckwheat on the morn-

ings when we have any dew.
A. J. Adrinson.
Winterset, Iowa, Aug. 9, 1881.

The Southwestern Wisconsin Bee-Keepers' Association will hold its hext meeting in Platteville, Grant Co., Wis., Nov. 30, 1881. N. E. FRANCE, Sec., Platteville, Wis.

#### SPECIAL NOTICES.

Single copies of the JOURNAL sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

When changing a postoffice address, mention the *old* as well as the

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100. ....

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Photographs of prominent Apiarists—Langstroth, Dzierzon, and the baron of Berlepsch.—Price 25 cents each. ....

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

The Beauty and Color of the hair may be safely regained by using Par-ker's Hair Balsam, which is much ad-mired for its perfume, cleanliness, and dandruff eradicating properties. 31w4

Nearly all the ills that Allief Mankind can be prevented and cured by keeping the stomach, liver and kid-neys in perfect working order. There neys in perfect working order. There is no medicine known that will do this as quickly and surely, without inter-fering with your duties, as Parker's Ginger Tonic. See advertisement.

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any person. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your name on the wrapper label of this paper: it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them.

Premiums.—For a club of 2, weekly we give a copy of "Bees and Honey;" for a club of 5, weekly, we will give a Cook's Manual, a Bee-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the Journal for a year free. It will pay to devote a few hours to the Bee Journal.

It would save us much trouble. if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office. County or State.—Also, if you live near one postoffice and get your point at mother be sure for get your main at another, be sure to give the address we have on our list.

### CLUBBING LIST.

We supply the Weekly American Ree Journal and any of the following periodicals, for 1881, at the prices quoted in the last column of figures. The first column gives the regular price of both:

Entered at Chicago post office as second class matter.

#### What and How to Plant for Honey.

A correspondent asks the following questions:

I want to plant extensively of honeymaking plants, but I need some information. Could you not give information through the columns of your paper on the cultivation of the different grasses, the latitude to which they are adapted, soil required, etc.; it would be valuable to many in these regions; state how they will do in orregions; state how they will do in orchards, woodland, pastures, or meadows, on drained lands, etc. I want to purchase seeds next fall, but I am much in need of information, and hope you will give it to me. P. M. Poplar Grove, Ark., Aug. 8, 1881.

As bee-keeping has heretofore been conducted in this country, the expansion of civilization has every year curtailed its reliability. As forests have trembled and fallen, under the sturdy blows of the woodman's axe, so have the facilities for early and vigorous spring breeding been lessened, and the probability of a lighter yield of linden honey been rendered more certain: as the green, flower-bedecked prairies and woodland openings have been transformed into fields of golden grain, so have been added to the certainty of a light honey crop; every marsh and waste-place reclaimed, has will amply repay for special planting. store of the toiling bee; scientific ag-

opinion that bee-keeping "does not pay." Nor would stock-raising be remunerative, if the cattle were deprived of their grazing land; sheeprearing would be unprofitable, if they were robbed of their pastures; and even market-gardening would cease to give satisfactory returns, if the specialist were to neglect stimulating the soil from which to obtain his bountiful returns.

Of course, with the natural and artificial increase of bees, and the civilizing destruction of nature's spontaneous flora, bee-keeping has become yearly more precarious, and we quite frequently hear inquiries for good locations for apiaries, and complaints of over-stocking. To be sure, white clover accompanies cultivation, and we can never weary in admiring its beauty and excellence, but this season has demonstrated, as have many others, that we cannot depend upon one source alone for satisfactory profits. Never was it more abundant, over so wide a range of territory, as it has been this season, but a few days of cold rains here, or bees too light to gather it there, or continuous adverse winds somewhere else, have changed many bright dreams to sad realities. With a general heavy bloom, but little honey has been obtained from linden.

We cannot understand how any one can mistake his duty to provide pasturage, if profits are expected; nor how a humane, generous-hearted beekeeper, can increase his numbers of bees without making some provision against starving. No person can view our streets lined with sweet clover, or listen to the busy music of the many bees amongst its sweet-scented foliage. without being convinced that it will not only pay to plant for honey, but that every dollar expended for sweet clover seed will be repaid by the bees with compound interest. For several seasons we have eagerly and selfishly observed this plant, and are persuaded that as a supplemental honey plant, everything considered, it has no superior, if an equal, in America. Now that honey is a staple article of export, and prices are rapidly becoming staple, this plant will, more than any other, make it a staple crop. Give it a liberal trial.

But many are not convinced (and do not wish to be) that honey alone wrenched its tribute from the sweet To such we recommend any of the clovers, especially white and alsike. riculture has made bee-keeping, year | They are both excellent for grazing, by year, a more precarious occupation, and the latter desirable for hay. Aland confirmed many apiarists in the falfa is also highly recommended.

We are often asked to give the name of some annual that we can recommend as an excellent honey producer, of sufficient hardiness to withstand excessive rain and drouth, and which will thrive in fence corners and outof-the-way places without special cultivation.

After several years of close, careful observation, we are more than confirmed in the good opinion we formed and expressed two years ago regarding the good qualities of Reseda grandiflora

Reseda Grandiflora.

(mammoth mignonette), as an excellent honey plant. It is a plant of vigorous, rapid growth; having a strong. deep-penetrating tap-root, it is very tenacious in its hold upon the soil, and will grow, and bloom, and yield a rich return of beautiful nectar under the most adverse circumstances; with a sharp, pungent taste, not unlike horseradish, the foliage is not a favorite resort for spiders or insects. Before white clover has fairly passed its maximum of excellence, the graceful and modest blossoms of the mignouette will have won the preference of the discriminating bees. The flowers are thickly studded on the points of curving racemes, and as the base matures its many pods well filled with diminutive black seeds, the point is daily presenting a succession of fresh bloom. which continues until winter has fairly set in, thus providing each fair day a nectar flow, despite the drenching rains which may precede.

It is not unusual to see racemes 3 ft. The foliage is not at all similar to Re-\ over-worked myself.'

seda odorata, and is said to be an excellent table salad. We hope every beekeeper will give it a fair trial. Plant early in the spring.

Sweet clover is said to make an excellent dressing for the soil, some asserting its superiority to red clover. and when stock are educated to it as a forage they eat it quite as readily, and thrive upon it.

If honey is the principal desideratum in planting, then harrow in sweet clover this fall, and as you will derive but little if any honey from it next season, in early spring harrow in some mammoth mignonette on the same soil, which will commence blooming in June, and astonish you with the excellence of its honey.

The latter, like sweet clover, will thrive upon and yield a rich return from any soil, wherever it can have a half a chance.

But do plant something—anything; if your bees cannot have the first and long-continued harvest from sweet clover, they will thank you for gleanings from the cattle and sheep pastures, and without murmuring eke out a bare existence on the proscribed thistles and burdocks, until nature, unmolested by man, bedecks herself in her autumn robe of flowers.

It will be seen, by reference to the Local Convention Directory, that the time of meeting of the Eastern N. Y. Bee-Keepers' Union, has been changed from Nov. 29, to Sept. 27.

Local Fairs. -- Bee-keepers attending fairs this fall should have a few bee-keepers' manuals, etc., with their exhibits. When taken in ½ dozen lots by express, for this purpose, we will supply any or all kinds, or one or two of each to make the half dozen, at 30 per cent. discount. If wanted by mail, add the postage. We do not send any "on sale or return." We will furnish copies of the BEE Jour-NAL free for distribution at fairs.

♠ An error occurred on page 250 of the BEE JOURNAL for Aug. 10. In referring to Rocky Mountain bee plant we inadvertently stated that it was a biennial; it should read "annual."

🐼 Mr. G. M. Doolittle, ln a private note, remarks as follows : " My report of this year's honey crop will be favorable, notwithstanding poor white or more in length. The roots, in taste, clover and basswood harvests, as well are a counterpart of horse-radish. as sickness in my family and being

#### Michigan Adulteration Law.

The following is the full text of a bill just passed by the Michigan Legislature "to prevent and punish the adulteration of articles of food, drink and medicine, and the sale thereof when adulterated:"

Section 1. The people of the State of Michigan enact, That no person shall mix, color, stain or powder any article of food with an ingredient or material so as to render the article injurious to health, with the intent that the same may be sold; and no person shall sell or offer for sale any such article so mixed, colored, stained

ticle so mixed, colored, stained or powdered.

Sec. 2. No person shall, except for the purpose of compounding in the necessary preparation of medicine. mix, color, stain or powder, or order or permit any other person to mix, color, stain or powder any drug or medicine with any ingredients or materials so as to affect injuriously the quality or potency of such drug or medicine, with intent to sell the same, or shall sell or offer for sale any such drug or medicine so mixed, colored, stained or powdered.

drug or medicine so mixed, colored, stained or powdered.
Sec. 3. No person shall mix, color, stain or powder any article of food, drink or medicine, or any article which enters into the composition of food, drink or medicine, with any other ingredient or material, whether injurious to health or not, for the purpose of gain or profit, or sell or offer pose of gain or profit, or sell or offer the same for sale, or order or permit any other person to sell or offer for sale any article so mixed, colored, stained and powdered, unless the same be so manufactured, used or sold, or be so manufactured, used or sold, or offered for sale under its true and appropriate name, and notice that the same is mixed or impure is marked, printed or stamped upon each package, roll, parcel or vessel containing the same, so as to be and remain at all times readily visible, or unless the person purchasing the same is fully informed by the seller of the true name and ingredients (if other than such as are known by the common name thereof) of such article of food, drink or medicine at the time of making or medicine at the time of making sale thereof or offering to sell the same.

Sec. 4. No person shall mix any glucose or grape sugar with syrup or sugar intended for human food, or any oleomargarine, suine, beef fat, lard, or any other foreign substance, with any butter or cheese intended for huany butter or cheese intended for himan food, or shall mix or mingle any glucose or grape sugar or oleomargarine with any article of food, without distinctly marking, stamping or labeling the article, or the package containing the same, with the true and appropriate name of such article, and the percentage in which glucose or grape sugar oleomargarine of suand the percentage in which glucose or grape sugar, oleomargarine or suine, enter into its composition; nor shall any person sell or offer for sale, or order, or permit to be sold, or offered for sale, any such [article] of food into the composition of which glucose, or grape sugar, or oleomargarine, or saine has entered, without at the same time informing the buyer at the same time informing the buyer of the fact, and the proportions in which such glucose or grape sugar, oleomargarine or suine, has entered into its composition.

Sec. 5. Any person convicted of violating any provision of any of the foregoing sections of this act shall for the first offense be fined not less than the deliberature that the first offense before the first offense before the first offense the the first offense be indeed that six that the dollars nor more than fifty dollars. For the second offense they shall be fined not less than twenty-five dollars nor more than one hundred dollars, or confined in the county jail not less than one mouth nor more than six months, or both, at the discretion of the court; and for the third and all subsequent offenses they shall be fined set less then two hundred and not not less than two hundred and not more than one thousand dollars, and imprisonment in the State prison not less than one year nor more than five

did not know that he was violating any of the provisions of this act, and that he could not with reasonable dil-

that he could not with reasonable di-igence have obtained that knowledge. Sec. 7. One-half of all fines col-lected under the provisions of this act shall belong and be paid to the person making the complaint, and the re-mainder shall belong and be paid into the school fund of the township, city or village where such conviction is had. Sec. 8. The prosperting afterneys Sec. 8. The prosecuting attorneys of the counties of this State are charged with the inforcement of this act, and it is hereby made their [duty] to appear for the people and to attend to the prosecution of all complaints under this act in all the courts in their

respective counties.
Sec. 9. All acts and parts of acts inconsistent with the provisions of this act are hereby repealed.

#### The National Convention.

We learn, with pleasure, that Rev. L. L. Langstroth will (his health permitting) be in attendance at the National Convention in Lexington, Oct. 5-7, 1881. He will be the guest of Mr. Wm. Williamson and family. The presence of this good man and illustrious bee-master, cannot fail to be a very attractive feature in the proceedings of the National organization. The programme, published in our issue of the 17th inst., presents a variety so so extensive and tempting, that pressing duties at home alone can prevent a large and enthusiastic attendance. Many points of general interest will be discussed, some or all of which will have a bearing on the future of bee-keeping, and no reflecting apiarist can for a moment imagine that he is not personally interested in these discussions. All should make a strenuous effort to be present, and our word for it, no Northern bee-keeper will regret having enjoyed a few very pleasant and profitable holidays with our Southern friends in their "Old Kentucky Home."

Honey Trowel.-Mr. J. M. Shuck has sent us an implement for inspection and trial, for uncapping honey. We have not had opportunity to test it vet. The following is a copy of his letter accompanying it:

I send you a honey trowel. a send you a noney trowel. I have been enjoying my first experience in extracting honey, and the first thing I did was to quarrel with the uncapping tools, called honey knives. I went to a seed store and purchased, for 30 cents, a gardener's trowel, which I observed and then tried again and cents, a gardener's trowel, which I sharpened, and then tried again, and I was pleased. To operate, lay the comb flat down, or set it on edge, as desired; if the operator is right handed, work from right to left, if left handed, from left to right; the tool will cut like a razor, and the caps will roll up beautifully. The one I send will hold the caps of one side of a Langstroth frame without emptying. If, after trial, you find it of interest to bee-keepers, you may notice it as you think it deserves; I have none for sale. for sale. Des Moines, Iowa, Aug. 3, 1881.

We invite special attention to our Market Reports this week. We give reports from several more of the chief American marts. Selling honey to the best advantage is of considerable importance now, and we have, therefore, made arrangements for weekly reports from the cities named, as well as some others not yet indicated. This will give producers an opportunity to select the best market, considering price and convenience. years.

Sec. 6. No person shall be convicted under any of the foregoing sections of this act if they can show to the satisfaction of the court or jury that he

#### MISCELLANEOUS.

Bee-Keepingin Southern California. -The extent to which bee-keeping prevails in the foot-hills of Sonthern California may be estimated by the following item from an exchange

The San Francisco Examiner places the number of hives worked this season in the countres of Los Angeles, San Diego and San Bernardino at nearly 200,000. There are, according to this authority, at least 600 men wholly engaged in the honey business this season, and an average crop is assured. assured.

Wooden Foundation.-The London Journal of Horticulture says:

Everyone who has any thing to do. even the slightest, with scientific beekeeping must be convinced of the value to bees and bee-masters of comb foundation. Personally I am disposed foundation. Personally I am disposed to endorse Messrs. Abbott's view that now comb foundation is so good, so strong and perfect, and at the same time so moderate in price, it is doubtful whether true economy is not best about by not using combs a second shown by not using combs a second time. There is something about the foundation that the bees appear to like, and they exclaim like the guest at the feast, whose silence obtained for him the character of being exceedingly elever till the apple dumplings were too much for his gravity, and he burst out with, "Them be the jockeys for me!" It appears to me that the bees express similar sentiments. I placed a frame with some comb in one hive, and in another with an inch of foun-dation in two pieces (part values part feast, whose silence obtained for him and in another with an inch of foundation in two pieces (part yellow, part white). In 24 hours I removed both; the comb appeared scarcely touched by the bees, but the foundation was built on "all along the line;" and, what very much surprised me the bees herd built up yellow gells on yellow. had built up yellow cells on yellow foundation and white on the white! How could they tell the difference and manage this? It seems to me that the midrib is the difficult point of manufacture to our industrious little workers, but when this is provided they lay on the cells at an express rate. I have seen wooden foundation

I have seen wooden foundation vaunted as preventing sagging, and being stronger &c. Accordingly I invested in some and tried 6 frames. It appeared a first rate article, and when fitted to the frames the latter prepared with the prepared with the prepared of the prevention of the prepared of the prepar were certainly as strong as pos-le. I expected grand success. ter were certainly and success. sible. I expected grand success. Great, however, was my dismay on the first time of opening (they were in different hives) to find the first pair that happened to be next each other glued together, the comb being built irregularly and attached to both wood foundations. The bars could not be reing of a large piece of comb. Then I found much uncovered—in fact, if the wax had been at all interfered with, here the bees had left it bare, but then here the bees had left it bare, but then to make amends, and determined, as is their wont, to economize space, they had built out the next comb to fill up the space—a greatevil, as the comb becomes so heavy that in hot weather it breaks off, and sad havoc and loss ensue. Still more surprising, I found that though the wax was worker cells, on the wooden foundation, they disregarded it and built, drone comb over garded it and built drone comb over, and on the irregular built cells they set

tiful wax foundation, for several pnrposes it appears unnecessary. Lastly, it seems to me to yield its contents to the extractor with difficulty.

A large Canadian Apiary.—It will be remembered that Dr. Nugent purchased several hundred colonies of bees of Mr. Heddon last season, and many would like to know how he is succeeding with his new apiary in Canada. From the Strathroy Age we copy the following particulars:

We are pleased to learn that our friend, Dr. Nugent, is reaping the re-ward his energy and enterprise so well entitles him to do. The Dr. invested apwards of a thousand dollars in bees at one purchase last fall, and we doubt not that his investment will prove a profitable one. We know him to be an enthusiastic and intelligent apiarist, and we expect soon to see his apiary take its place among the largest and best managed establishments of this kind in this continent.

Some days ago we greatly enjoyed a visit to "Linden Apiary," where we found the proprietor, Dr. Nugent, actively engaged gathering in the honey harvest. The Dr. and his manager, Mr. Conklin, showed us over the entire grounds and demonstrated some Mr. Conklin, showed us over the entire grounds, and demonstrated some of the minutæ of bee-keeping. There are near 400 colonies now in the apiary, most of them are Cyprian, Italian and Holy Land bees, some few German or common black ones. which are rapidly being replaced by the three first. This is done by destroying all the queens belonging to such stocks and giving them the desired pure ones, thus in a few weeks rendering the entire colonies so acted upon pure. tire colonies so acted upon pure. Some few blacks will still be kept, such as have proved themselves ex-traordinary good workers.

We have lad a sample of the section

We have had a sample of the section honey sent to our office, and for virgin whiteness, as well as for neatness of style and flavor, it cannot be surpassed, if even equalled.

The total yield this year is about 15, 000 lbs., though it is expected when setting up the bees for winter 1,000 or 2,000 pounds more will be received.

The doctor intends establishing another yard next spring within a short.

other yard next spring within a short distance of the town, and at present thinks of locating it above the town on the banks of the Sydenham.

Honey Dew .- An exchange contains the following story concerning the appearance of honey dew in Georgia:

My daughter was engaged early Sunday morning in sweeping off the front porch, when her attention was attracted by the plaintive cries of young chickens and the distressed clucking of a hen. The sound came from a pile of leaves under some poplar trees in the yard, and hurrying to the spot is the found the little chicks all the spot she found the little chicks all stuck up with leaves, rolling about struggling to free themselves, and two of the little sufferers were stuck together. She picked these two up, and coming to the house called me. On examination we found them covered with a sticky substance, which seemed to have come off the leaves. I went into the yard, and found it on all the leaves, and, tasting, was surprised to find it honey. Looking around I could find it honey. Looking around I could see it glistening in the sunshine like diamonds on every leaflet, and on the porch for 2 or 3 feet were splotches of it. Several neighbors dropped in during the day whom I told of the honey shower, supposing it had been general, but they were incredulous till shown evidences of it. In the evening of the same day I noticed a mist between me and the sun, and a closer examination disclosed the fact that we were having a repetition of the phenomenon, which was witnessed by many people. which was witnessed by many people. While it did not run off the house, either morning or evening, it covered the leaves of the trees and shrubs, and was, without a doubt, honey dew, and that, too, from a cloudless sky.

#### My Prize Poem on the Honey Bee.

WM. F. CLARKE.

In the brief sketch of my apientural career which appears in the BEE JOURNAL of July 13, accompanying the portrait, no mention is made of what I have ever regarded as one of the bright before grained by me as a the highest honors gained by me as a the highest honors gained by me as a bee-keeper. Ten years ago this summer I succeeded in winning the \$40 prize, offered by H. A. King & Co., of the Bee-Keepers' Magazine, New York, for the best poem on "The Bee." I was very proud of the achievement, and am yet. Up to that period of my life I had not considered myself, nor been considered by others a noet. I been considered by others, a poet. I had, like most people who handle the pen much, now and then jingled a few rhymes together—that was all. When rnymes together—that was al. When I saw the advertisement offering the prize, I said to myself, "Now, this thing won't go altogether by poetic merit. There must be knowledge of apiculture displayed, as well as poetic genius. I think I know the bee pretty there well as a gring to try for genius. I think I know the bee pretty thoroughly, and I am going to try for this prize." On announcing this determination to my better-half, she threw several pails of cold water on it. "The Yankees will never let that prize go to a Canuck; "You're not a poet, you know;" "Time and trouble thrown away," etc. The true use of advice is to make us more firm in our own way, so I went ahead with my poem, resolved to do my very best. poem, resolved to do my very best.

When the letter came from New When the letter came from New York, announcing my success over 40 odd competitors, I felt greatly uplifted, but tried, of course, to seem very meek. I handed the letter to my wife, and retired quietly from the room, so as not to be betrayed into any self-glorifying behavior. That night, self-glorifying behavior. That night, without any mention of the New York letter, the subject of the curtain lecture was the duty of not being exalted above measure in view of any honor or distinction that might befall Next morning, at the breakfast table (all our children were at home then now 6 out of 8 have gone from us) the lady of the house made a little speech on this wise: "Children, it is now definitely settled that your papa is a poet. This explains a great many things I never could understand, but I shall henceforth ascribe to the eccentricities of genius." That plea has come in very opportunely many times since; in fact, between "the license of poetry" and the "eccentricities of genius." I get the liberty of doing pretty much well like as I like.

The poem in question has never ap-

several of my friends have inquired for copies of it of late, and as it may be said to be "out of print," it might gratify others, as well as myself, to see it in our forested. see it in our favorite old apicultural JOURNAL.

PRIZE POEM ON "THE BEE.

Where in the realm of nature do we see A worthier study than the honey bee? What curious instinct dictates every art Wherehy this little creature acts its part! How do the marvels of the hive combine All other insect wonders to outshine!

An swift-winsed forager, the bee sets forth, Scouting from east to west, from south to north, Intent on gathering, with industrions haste, Sweetness that else upon the earth would waste; And, whereso'er the wunderer may roam, Laden she files unerring to her home.

A skilful mean facturer, she makes,
By some internal process, pearly wax,
A substance plastic, soft and delicate,
Beyond the power of man to imitate—
Suited to house the growing insect broad,
Or to encase the store of luscious food,

The hee's a warrior hold, and never saw Fee who could make her from the field withdraw; In single combat, or in army fight, No bee has ever shown the feather white— "Ready, are ready," any time to rally. And at a moment's notice forth to sally,

The bee's a model citizen—ease, food, Life, all is yielded to the public good; Xo individual interests weigh a grain Where there are public interests to maintain; Kin old Rome, when all were for the State, Kich helped the poor, and poor men loved the great

The bee, in uges past, was liftle kinown in characters of worker, queen and drone; he may be the thories and apprentions (Faurpoid the place of rational positions, And, while a dozen bees remained alive, No man durst search the mysteries of the hive.

Each antumn, when the tempting store of honey Excited appetite or love of money. The faithful workers forfeired their lives. That man might get the contents of the hive; A tragic field to the busy season. For which necess ty was made the reason.

Now, thanks to science and its hand-mad, art, The apiculturist acts a wiser part; The comb is built upon the movable frame, With smoke or sweet the dery bees we tame, Control the busy Inmates of the live, Obtain their stores, yet save them all alive.

The brisk Italian now assumes the place of the familiar, black, old-fushioned race—Nimbler, more energiet, more prolific, And, happily, in temper more pacific; A more untiring and adventurous rover, And able to suck honey from red clover.\*

Of old a super-glass, or honey-box. Was placed above each of the thrifter stocks. In hope they might be tempted there to store A surplusage of twenty pounds or more of dirst-class honey; but a lazy fit Would oftentimes prevent their doing it.

Now in these namy days of honey-slinking, The bees are kept without cessation bringing New stores of sweet, which quickly we transfer Into the mel-extracting cylinder. And thence by use of force centrifugal, Get honey by the pail or barrel full.

The march of progress is not over yet.

Nor will be till our apiarists set

A plan for making artificial combt.

And thus provide the bee a finished home,

To which all hands shall busily fetch honey,

And smiling bee-men turn it into money.

Next we will find a bee like the Egyptinn For storing honey, but of a description Quite opposite in temper, and without That ugly inclination to durt out The venomed sting, on slightest provocation, Nature's worst form or counter-irritation.

With all facilities for honey getting A race of bees that will admit of vetting; Each honsehold of an apinry possessed, Bee-keeping followed with untlagging zest, Honey and milk shall flow all countries through, And "home, sweet home," obtain a meaning new

'License of poetry claimed here. The writer has never been able to satisfy himself that the Italian bee gathers from red clover to any extent, but it is often asserted as a fact, and clover was wanted here as a rhyme to "rover."

†Comb foundation has come into use since the neem was written.

Western Stock Journal.

#### Seasonable Hints-Summer.

O. CLUTE.

The first part of the month of August is, in many places, a season of enforced idleness among bees. The enforced idleness among bees. The enforced idleness among bees. The summer flowers are past, and the fall flowers are not in bloom, hence there have to be gathered. Where the past to be gathered. nowers are not in bloom, hence there is little honey to be gathered. Wherever corn is largely cultivated the little fellows will carry a great abundance of pollen into the hives to help the brood-rearing of late fall and early

spring when no pollen is to be had.
As soon as the surplus honey-boxes, or sections, or frames, are full and sealed, they should be removed from the hives. Indeed it is usually best to remove the surplus receptacles as honey-gathering ceases, even if they are not full. Bees are apt to carry some of it below, and they soil it by traveling over it.

At this time great care must be ex-At this time great care must be ex-ercised, when working among bees, not to incite them to robbing. If honey is left exposed they will at once begin upon it, and soon the whole apiary will be in a high state of excitement. As soon as the supply which has roused them is exhausted they will begin on the weak colonies, master them, and clean them out com-pletely. A little carelessness in ex-posing honey will thus often be the

cause of losing several colonies.

If bees once get to robbing they can
be dispersed for the moment by sprinkling the hives that are being robbed with water from a common watering-pot. The bees seem to think it is rainpot. The bees seem to think it is raining, and so the robbers rush off home. A good means of stopping robbing is to pull several handfulls of weeds and grass and leaves and throw them loosely over the entrance of the hive that is being robbed. Bees belonging to the hive will make their way out and in through this obstruction. But robbers seem to be chargington. robbers seem to be chary about going through it. Probably the best means of stopping robbing is to spread a sheet over the hive that is being robbed, letover the hive that is being robbed, letting it completely cover the hive, and was much exercised to decide whether

come down to the ground all around. This, of course, pre-supposes that the hives are set near the ground, as all hives should be. Four or five inches above the surface is plenty.

As soon as the honey ceases coming As soon as the honey ceases coming into the hive the queen relaxes her efforts in laying. Instead of depositing 2,000 or 3,000 eggs a day, she will, perhaps, lay only a few hundred. This, of course, makes the growing brood so much less, and hence there will be fewer bees to gather the fall harvest than there would be if the queens would lay every day all the eggs possible for them to lay. In order to promote laying some bee-keepers are accustomed to feed each hive about a marter of a pound of thin sugar syrup eustoment to teed each investoom a quarter of a pound of thin sugar symp every day from the time honey-gathering ceases until it begins again. This feeding needs to be done with

great caution, in order not to incite robbing.

As soon as the fall flowers begin to yield honey, see to it that the surplus honey receptacles are all in place. Prevent swarming if possible. The parent hive is weakened, and the new one does not gather enough to last it over winter.

For the American Bee Journal.

#### Italian Bees in Australia.

s. MCDONNELL.

As it may be interesting to the readers of the BEE JOURNAL to learn in how far my experiment to introduce Italian bees into this Colony has progressed, I send you a few notes on the subject.

The mail steamer" City of Sydney" The mail steamer. City of Sydney left San Francisco on June 4, and arrived in Sydney harbor on the evening of the 1st inst. The mails by her were delivered here on the morning of the 2d inst., and by a letter from Mr. A. II. Newman I learned that, according to my instructions, two colors. Mr. A. II. Newman I learned that, according to my instructions, two colonies of Italian bees had been shipped by the steamer. I next visited the ship's agents, who handed to me a letter from Mr. Williams, of Messrs. Williams, Dimond & Co., San Francisco. Mr. Williams, although a stranger to the way kind enough to attend cisco. Mr. winiams, attnough a stranger to me, was kind enough to attend to the shipping of the bees at San Francisco, on their arrival from Chicago, and I am much indebted to him. The shipping documents contained in Mr. William's letter enabled me to get immediate possession of the? hives Mr. William's letter enabled me to get immediate possession of the 2 hives, and by means of a cab (traveling gently) and the suburban railway, by noon the bees were on their stands on my ground at "Homebush," about 8 miles from Sydney. The portico of each hive (Langstroth) contained about a quart of dead bees, which I had removed and preserved, in order to see if the queens were among the dead. I have looked them over (the day was bright and warm and the bees were soon flying briskly. I now had an opportunity, for the first time, of seeing Italian bees, and I was much pleased to see that the difference between them and the black bees is sufficient to be noticed by such a fresh acquiringer to their appears. fresh acquaintance to their appearance as myself. We have, so far, had a very mild winter, the days having been warm and clear and the nights cool, the thermometer on one or two occasions showing the mercury at

freezing point.
You will observe that the bees left Chicago at the end of May, or about Chicago at the end of May, of about the middle of your spring, and arrived here on the 1st of July, or at the beginning of our winter. They, therefore, after having passed through an unusually severe winter with you, have been subjected to the long journal of the subject of the long journal of the subject of the long journal of the subject of the long property of the subject of the long journal of the subject of the s nave been subjected to the long Jour-ney from Chicago to San Francisco, by rail, and a 4 weeks' sea voyage to Sydney. It is true that our winters seldom are so inclement as to prevent bees from thying all the time, but, nev-ertraless. Learnet but think that the ertheless, I cannot but think that the best time for bees to arrive at Sydney from San Francisco would be October.

or no my new friends, the Italians, paid our climate the compliment of taking the mild winter to which they landed, as the summer which should, in ordinary course according to their calendar, have been allotted to them. I am afraid, though, that if they en-tertained such a notion, their minds have been disabused by the absence of

Having landed the bees safely, my Having landed the bees sately, my next trouble was their proper care and maintenance, and I turned to the hand-books—including Langstroth, Cook, King, Quinby and Root, which I have on my shelves, for information. For the first time in applying to those books for assistance in a dif-ficulty, and you will understand in how far I am indebted to them when you learn that I have none other than the learn that I have none other than the advice to be gained from books and periodicals to guide me—no practical friend to give me a wrinkle at the proper moment, or show me how to avoid doing things as they ought not to be done—I sought without finding.

The points on which I more particularly sought for information were, 1st, The general treatment of bees after a 4 weeks' sea voyage; 2d, Their treatment in having to face a second winter, without the intermediate seasons. If you think it worth while to give a few hints on these points, they would probably be perused by others, as well as myself, with interest. Although they would come too late to be of series to be in the property of the pr vice to me in my present emergency, they would be in good time should I try a second experiment. Under the circumstances I hold that a little food would not come aniss, and that an inspection of the hives, during fine weather, would do no harm, and would relieve my curiosity as to the bees rearing brood, as they would in the ordinary course of summer following winter and spring. Not havlowing winter and spring. Not having a tool handy to remove the frames without jarring, from the position in which they were fixed for traveling, I deferred the operation, and have since been prevented from inspecting on account of wet weather, during which I deemed it inadvisable to open the hives. I have, however, given them food in the shape of honey and syrup, hives. to gnard against their food combs being empty, although I had misgivings that by so doing I might be encourag-ing breeding at an unreasonable time vear.

You will thus see that the experiment of introducing Italian bees is fraught with difficulties, the more especially when undertaken by one whose only experience lies in having put the most excellent rules contained in your American hand-books and periodicals into practice. I feel like one wandering in the dark in unknown parts, to whom a little practical advice exactly to the point would be as welcome as the light of day. Should the experiment not succeed, I should not determine that it cannot be successfully performed, but should attribute the failure to my want of experience, and should try it again.

Your JOURNAL continues to be read with great interest. I must compliment your artist on the excellent reproduction of your photograph, which appeared as a wood cut in your JOURNAL. The possession of the photograph kindly sent by Mr. A. H. Newman enables me to form an opinion of the reproduction. It is an additional in your American hand-books and pe-

the reproduction. It is an additional proof that the matter in the JOURNAL is true to nature, and that its readers may rely on its counsel.

Sydney, Australia, July 12, 1881.

[When you placed the hives upon the stands you should have taken out the frames and examined them critically— 1st, for the queen; 2d, to mend broken comb; 3d, to regulate feeding; 4th, to see the amount and condition of brood. If it is possible for frequent flights, we would advise stimulating for immediate breeding, as many of the bees are old, and the colony will soon dwindle if new bees are not reared to take the place of the old ones.—ED.] For the American Bee Journal.

#### Value of the Cyprian Bees.

WM. M. ROGERS, D.D.S.

The evidence of the BEE JOURNAL against the character of the Cyprian appears to be cumulative, and 1 k the inference a pretty fair one think think the interence a pretty fair one that the editor's judgment begins to yield to the pressure. It would be presumption in me to attempt to instruct you, but pray permit me, in your columns, to advise those who are in the possession of pure Cyprians to be careful how they let a good thing slin their fingers. I have now had slip their tingers. I have now had Cyprians from the Jones-Benton im-Cyprians from the Jones-Benton In-portation for about one year. I am sure that I do not at this writing, find any cause for regret in the fact that I sacrificed a nice strain of Italians for them.

Hybrids, except in rare instances. are ranked as the most vicious and irritable bees, and we ought not, of course, to expect that Cyprians, when crossed, should be an exception. think extreme crossness or ferocity (the word speaks the nervousness of the writer of it) in a colony of Cyprians, imported though it be, will, in from the impure mating of the queen.

My experience is to the effect that

Cyprian queens mated with Italian drones give a progeny, in frequent eases, that is unbalanced from the eases, that is unbalanced from the character of either parent. I bred colonies in ISSO from Cyprian queens mated to Italian drones that carried, as far as I could see, all the characteristics assigned by Mr. Benton to the pure Cyprian, excepting, only, the case of their queen progeny. From the same stock 1 bred other colonies just as nice as the above, that I would nit against the continent as fighters. and yet I have not known a single instance in which even the worst of these have volunteered an attack.

these have volunteered an attack. I cannot but regard it as a matter of regret that Mr. Jones should leave Syrian bees with Mr. Benton on the Island of Cyprus. This, I think is a fairly presumable fact. It is to be regretted in a less degree, only in the event that his sales from this source have been less, that Mr. Fiorini should have established his Cyprian apiary in the presence of Italians. We owe a debt to the past as well as to the future. The censured character that falls to the inheritance of the Cyprian, under thousands of years of isolation and trial, ought not, if valuable, to be thoughtlessly or recklessly lost; it seems a moral wrong to do so. From my observation I think the Cyprian has everything to lose and nothing to gain from crossing, whether with Sy-

rians or Italians. I shall not indorse the Cyprian for T shall not indorse the Cyprian for the full measure of gentleness that is exhibited by the Italian, but 1 do affirm that Mr. Benton's statements on this point are, to the letter, true, and 1 boldly assert that his affirmation is worth more than the denial of a thousand loose experimenters added to that of another thousand of careless obthat of another thousand of careless ob-servers. I shall advise no one to give up Italians for Cyprians, but to those who make the experiment or who have already invested, I say, if you are first sure of the purity of your stock and understand its character, you can write as your second proposition—suc-cess. Let the uninitiated know that the tests of unity as applied to Italcess. Let the uninitiated know that the tests of purity, as applied to Ital-ians, are not a test for Cypriuns, for a Cyprian queen mated with an Italian drone will produce a race so closely resembling pure Cyprians that it will take more than ordinary powers of discrimination to distinguish the dif-ference, and yet in character the bees are essentially different. Therea t inare essentially different. Hence I in-fer that many breeders who sell untested Cyprians, having not the ghost of a chance for pure mating, will yend many bees that will stand the test of the 3 bands. What is the test of a pure Cyprian? I have not found it in the worker progeny, but 1 will not

worker and the queen progeny considered together in every case. As far as I have observed, the queen progeny of a mismated mother will manifest the mating. If this be so it will never the mating. If this be so it willnever be a popular fact among breeders until buyers are willing to pay for what they get. Many of these untested Cyprians of ISSI and their mongrel progeny will appear at the bar as blatant witnesses and vociferons accusers of the pure Cyprian. Could any race of bees sustain character under the conditions likely to be engendered against this "noble bee?"

Shelbyville, Ky., Aug. 15, 1881.

(We want all the light possible regarding the Cyprian and Syrian bees. If they, or either of them, possess superior traits, why does not Dr. Rogers enumerate them? It is an admitted fact, that the progeny of an Italian queen mated with a black drone, are worse in disposition than the blacks; per contra, it is claimed that the progeny of a black queen mated with an Italian drone, are more amiable and vigorous. This will probably account for the frequent assertions that hybrids are the best workers. Again, is it not possible to combine the better traits of the Italians, Cyprians and Syrians, or a majority of them-if any are superior?—Eb.]

For the American Bee Journal.

#### Exhibiting Bees at Fairs.

J. M. BROOKS.

Having read the article on "Manage-ment of Bees at Fairs," I will say that, as I have had a little experience in that as I bave had a little experience in that line, I am of the opinion that our ef-forts to instruct the public in this way will prove fruitless. Several years ago I obtained permission to exhibit some bees at our State Fair; in due time I arrived at the grounds and opened up my bees. The public were greatly interested and surprised to see how easily the combs could be handled, the ny the combs could be handled, the queens found and shown them, and all without the use of smoke, veil, or gloves. Although the crowd contin-ually surrounded the bees, not one rebe working nicely, when the superintendent came up; taking me to one side, he said that I would have to close up my hives, that they were not sting-ing anyone, but were giving the "candy ing anyone, but were giving the cardy stands" trouble. I explained the mat-ter to him, that, as there was an apiary of blacks kept in the neighborhood it was very plain to be seen that as my bees were Italians he would find that about one of my bees to 50 of the blacks were causing the trouble. He admitted the fact, but said that the candy men would not be satisfied un-less my bees were shut up. I confined them to the hives that evening after

The next day I visited all the stands The next day I visited all the stands, and such a sight—pound after pound of stick candy lay on their counters, exposed not only to tempt the poor innocent bees to a feast, but to all the dirty flies, also. Bees were everywhere, completely driving away proprietor and customers, and taking everything before them. Of course, they never valuateered to sting any never volunteered to sting any one unless pinched, nevertheless their one unless pinelied, nevertheless then presence filled everybody with fear. Thousands perished at the "sweet cider" presses, and made things lively for the "hot-candy" men, who boil and serve their caudy on the grounds. Of course all were free in laying the whole trouble to the ''confounded bee man,'' in bringing bees on the grounds, when the truth was I had kept them closed up, except the one day.

Stepping up to a stand kept by a lady (where the bees were just swarm-

pure Cyprian? I have not found it in the worker progeny, but 1 will not do so. I am almost sure that for the most of us it must be sought in the last the bees were all this bother. The managers made of us it must be sought in the last the bees were tould be a last work and it works to a charm. After the fall season is over for surplus, I take a blanket made the size of a cook to produce one intelligent apiar-

him take 'em off the grounds, and here he's went and left all these a flying around here; confound 'em, I wish they were all dead!"

I could not help smiling at the view she had of the matter, so explained that she was laboring under a mistake, that I was the bee man and had closed up my bees the evening before, and that those dying belonged to hives kept outside the grounds.

I had been to some trouble and ex-pense in getting my bees on exhibibition, and, although not to blame for the hundredth part of the trouble, yet the hundredth part of the trouble, yet I had to be ruled out in order to satisfy the confectioners. I attached no blame to the superintendent; he acted and reasoned in a gentlemanly manner, saying (as I fully understood) that they were ignorant of the cause of the trouble, and as long as they could see my hives open they would not be convinced but what every one of the bees belonged to my hives. I would not discourage anyone from the undertaking, but will say unless there has been an understanding "all

there has been an understanding "all around" beforehand, that sweets and around everything to tempt the bees must be kept under cover, there will be trouble.

As to persons getting stung, there need be little fear if the exhibitor knows his business; if he does not he had better leave the bees at home.

Columbus, Ind., Aug. 10, 1881.

[Mr. Brooks would now probably meet with more encouragement for his beautiful bees; and certainly nothing could be more interesting than a practical lecture from him in connection with his exhibition. Last fall, at the Wisconsin State Fair, a gentleman of Madison exhibited his bees, and explained the methods of manipulating them. This season, with a good yield, his extracted honey has been sold as fast as obtained at comb honey prices. This is what is wanted, and bees are of much more importance to the country than hot glucose candy.-Ep.]

For the American Bee Journal.

### Preparing Bees for Winter.

L. J. DIEHL.

Now is the time to prepare colonies for safe wintering. First, see that each colony has a prolitic queen, and if it has not already enough honey, be sure that the colony has enough bees to fill up for winter as soon as the fall bloom comes. Each comb should have bloom comes. Each collo should have at least one hole through it, for a win-ter passage, for the bees to pass from one comb to another, without passing around the frame. I have examined many a colony of bees that have been wintered in a careless way, that were mot provided with winter passages, and have starved with plenty of honey on the other side of the comb. I feel certain that if they had had a passage through the comb they would have survived the winter. If any colonies fail to gather enough honey for winter, in the fall, unite all such together, for you can make one good colony out of 2 or 3 poor ones, and 1 often find colonies thus treated the very best colonies in the spring.

I early prepare my colonies for win-ter, on the summer stands. This is the critical point in wintering bees, and it must be done in good season so that the bees can properly finish up the work before the frost cuts off the 1 have read the published re-ry carefully, and can account bloom. I have tead the published reports very carefully, and can account in no other way for the bad results of last winter but by the neglect to have the bees prepared in good time. They should have at least 2 or 3 weeks pleasant weather before winter sets in, to seal up and clean the hive; then, if properly packed inside the hive and kept dry, they will winter in good

the hive on top, and long enough to reach down to the bottom of the frames, smoke the colony, take off the frames, smoke the colony, take off the surplus arrangements, contract the colony to the proper size, put in division-boards, fill the empty space with dry chaff, or any dry absorbent that may be handy, such as rags, tine hay, or straw, place the blanket on the top of the frames, then drop the end of the blanket down back of the frames, tuck the edges in nicely, close un the tuck the edges in nicely, close up the hive and fill the top or upper story with an absorbent, cover the hive to keep perfectly dry. I bore a ½-inch hole in the front of hive, about % of the way up from the entrance, front the hives to the south, and all is ready.

I have wintered my bees with success for at least 15 years, and I know whereof I speak. People are depend-ing too much in chaff packing outside of the hive; they must have at least one end of the frames to run to the one end of the frames to run to the hive without packing, and that end should be the front, and the hive must front the south. All the bees that were in my town are dead, except mine, which wintered safely. I have 135 colonies, and my loss in winter was 6 colonies, 2 of which became queenless, 2 were destroyed by mice, one starved and one died with dysen-tery. This has been a very good sea-son for honey. My bees have had no rest since the fruit bloom; there has been a constant flow of honey. Butler, Ind., July 24, 1881.

For the American Bee Journal.

#### The Origin of Drones.

C. J. ROBINSON.

In a paper read before the Entomological Society, published on the first page of the BEE JOURNAL, of July 27, Prof. A. J. Cook wrote: "Though doubt is sometimes expressed as to the origin of drones by parthenogenesis, there is no such doubt among intelligent apiarists." If all intelligent sis, there is no such doubt among in-telligent apiarists." If all intelligent apiarists agree on any certain point, why mention a doubt concerning the admitted fact, unless the writer thereof admitted fact, limess file writer thereon assumes to dispose of or settle the question of who rank as intelligent, and those who do not? Said writer was well aware that 1, for one, "express doubt," yea, controvert the doctrine that teaches parthenogenesis in

Mr. Cook, providing he is reliable authority on the subject he discussed, was aware that at least two intelligent was aware that at teast two intelligent appiarists, namely, the lamented Major Minni, a learned physiologist and enthusiastic apiarist, wrote thus: "Parthenogenesis, so far as the honey bee is concerned, would be difficult to prove with all the voluntary muscles of the desired proversion of the provention of the prov in the bees' abdomen, or any pressure of the cells that might be brought to the cetts that might be stought to bear on the oviperous queen bee." He further says: "The proof is want-ing that the eggs may not have al-ready been fecundated in the queens

I claim, as set forth in a former ar-I claim, as set forth in a former article, that queens are impregnated with royal jelly (drone's semen) while in the larval state. Furthermore, I will here allude to one other enthusiastic and experienced apiarist who, though read out by Prof. Cook as not being counted "intelligent," advocated the ground detries as to the "corigin of counted "intelligent," advocated the same doctrine as to the "origin of drones" that I promulgated in the Big JOURNAL of March 23. The in-dividual referred to is Mr. Ellin Kirby, a naturalist of some sense, at least, if not intelligent according to the before mentioned standard. Prof. E. Kirby was a valued correspondent of the Albany Country Gentleman, and after the American Bee Journal was started, he contributed to both periodicals until his health failed. The reader can compare the articles of the said Professors and determine which, in a scientific point of view, "expresses" the highest degree of in-

ist, not barring himself, who can explain and prove beyond a doubt, that pain and prove beyond a doubt that drones originate by parthenogenesis. No intelligent scientist will contess that he, in matters pertaining to any science, pins his faith upon some one, or some few observations of his own, and say that others are non-intelligent who are not of the same faith.

The doctrine of parthenogenesis is of modern invention, being held forth as a hypothesis to account for the reproduction of certain insects, but production of certain insects, but there is no record of evidence showing that parthenogenesis exists, in fact, in any living creature, much less that it explains the phenomenon of virgin queens reproducing drones. Certain German scientists, namely. Von Sie-bold, Leuckart, and Dr. Donhoff are the originators of the term partheno-genesis, and defined its meaning. Those men fancied that drones origi-nated as explained by their new the-ory, and the lamented Baron of Ber-lepsch, being in the dark regarding the phenomenon, adopted the hypoththe phenomenon, adopted the hypoth-

the phenomenon, adopted the hypothesis as a fact.

Either parthenogenesis is a false doctrine or the Creator had no wise purpose in making a distinction of sex. True, if we have faith in some stories, some of us might believe that parthenogenesis existed even in the human race, but none would be wil-ling to vouch for the truth of those by them advocated. Of course, I have no reference to the case of Joseph's bethrothed, nor to the 15other virgins who, according to ancient history, are reputed to have reproduced indepen-dent of the male sex!

Parthenogenesis and Mormonism may yet transform the relation of human males to the reproduction of our race, like the relation of the drone to the bee species. I hope that some Professor will deign to write an essay on this subject. Richford, N. Y., Aug. 15, 1881.

For the American Bee Journal.

#### Bacteria, a Cause of Loss in Winter.

JAMES HEDDON.

In the BEE JOURNAL of June 15. Mr. J. O. Sherman wants to know why some scientific "beeist" does not give us the proof, if it is bacteria that kills our bees. First, the theory or suppoour bees. First, the theory or supposition, and then the demonstration. How long did bacteria produce itch, diphtheria, etc., before the scientist guessed (from symptoms) the true cause, and then how long was it till he demonstrated the truth of the guess? Imagination is the parent of pagerly all practical inventions and discourse the street of the second of the s nearly all practical inventions and discoveries. I wish to say here, that thin honey is not the main great cause of dysentery, for often have 1 known colonies to die early, when apparently none but the best of stores were theirs. I wish to say here, that thin Again, I had my large apiary of 375 colonies nearly all winter safely, with considerable cider honey in each hive. We have many credible reports where bees all died, with none but sealed, thick honey; I have had colonies die with dysentery in its worst form, ere with dysentery in its worst form, ere winter had fairly began, where their honey was, apparently, first class.

Mr. Sherman says, "nearly all admit" that bees can endure long con-

finement if the honey is thick and in good condition. In nearly every re-pository, or out-of-doors, as soon as a colony is dead, dampiness accumulates in the hive, an effect—not a cause—of the death of the bees. If the causes Mr. Sherman ascribes are the true ones, why is there such a difference in the spaces of animies only a few miles ones, why is there such a difference in the success of apiaries only a few miles apart? Why cannot you go about in the fall and select the bives where the bees are going to die? I thought that the winter problem was still unsettled, not "admitted." This thin-honey the winter problem was stiff unsertied, not "admitted." This thin-honey theory came up, was advocated, and let drop, some years ago, as the BEE Journal shows. We believed that dysentery had one cause; we knew that it raged in its worst form where no thin or sour honey was present. Of JOURNAL shows. We believed that dysentery had one cause; we knew that it raged in its worst form where no thin or sour boney was present. Of course we dropped this seeming cause.

Mr. Sherman further says, "assertions do not satisfy." Where does he find Mr. Sherman further says, "assertions do not satisfy." Where does he find any assertions of mine as to what causes dysentery? I have, from the first, called the bacteria theory only a hypothesis, and said it was the only theory that would admit of all the effect we had experienced and heard reported. We had all heard of thin honey and fall honey as causes, and our experiences and observations had convinced us to the contrary. We our experiences and observations had convinced in to the contrary. We knew bees had wintered in damp repositories, where "the combs were all moldy" (I quote Mr. Balch, of Kalamazoo), and died in dry ones, where all was dry and an even temperature existed; that they had come through in fine condition out-of-doors, during damp winters where the combs molded hadly and had all died in some aniaries. damp winters where the commission of badly, and had all died in some apiaries in seasons just the opposite; that some lived while others died, only a few miles apart, where the winter was the same, and honey in the same condition as far as thinness was concerned.

For the American Bee Journal.

### Introducing Queens with Safety.

T. E. TURNER.

1 write on introducing queens in 2 hours' time, for the benefit of those who purchase queens and are doubtful of successful introduction. When an apiarist has purchased a fine queen, at a cost of from \$2 to \$20, it is a matter of some interest to him to know how to introduce her to a colony with safety. Different writers have given their methods, and in works on the apiary we find several described; the one I have adopted as the safest and quickest is an old one with variations.

When your queen has arrived, which should be in warm weather if at all possible, take a frame of brood just hatching from each of a number of colonies, as you may choose to in-troduce your queen to a large or small colony, and place them in a new hive on a new stand. Get combs of brood and bees from colonies that have no queens, or that have virgin queens

where there are no eggs, if possible.
Then let the bees in the new queen-less colony stand 2 hours, with the en-trance open, in the middle of the day when bees are working busily. When when bees are working busily. When the old bees will have gone back to the old bees will have gone back to the colony from which they were taken, the cage or shipping box con-taining the queen may be opened and placed inside the hive prepared for her, with the edge of the box open against one of the combs, and she will leave the box or cage at her leisure, and go on the combs among the young

bees unmolested.

If it is desired to make the introduction of your queen doubly sure, shake or brush off all the bees from each comb into or in front of the hive each come mice or in front of the live from which taken, and place the combs of brood alone in the new hive. Let them stand for 2 hours, when there will be quite a cluster of young bees hatched out, among which your val-uable queen may be allowed to crawl ambarned.

unharmed.

This is the safest and quickest method that I have ever tried. The plan of caging a queen for 4s hours between combs or on a comb I have found to be unsafe and tedious. On one occasion I caged a valuable queen on a comb in a hive containing old bees for 4s hours, and released her to have her balled up and only saved her bees for 48 hours, and released her to have her balled up and only saved her from being stung to death by a violent smoking and driving of the bees backwards and forwards through the hive. The 2 hour method may not be a success in the hands of some, in every case, but so far I have not failed with it in one instance, and I have introduced a number of queens in this way. I have had some failures in all other methods but have never failed way. I have had some failures in all other methods, but have never failed by this plan, and, all things considered, this 2 hour method appears to

ting queens run right into a queenless colony, and certainly it is 99 times the safest.

Sussex, Wis., Aug. 5, 1881.

#### Convention in Nebraska.

A meeting of the Nebraska State Bee Keepers' Association will be held in Omaha, Friday night, Sept. 16, 1881, to consider wintering reports and the best method of wintering, and such other business as may demand their attention. T. S. VANDORN, Pres. attention. T. S. VANDO GEO. M. HAWLEY, Sec.

Lappenda copy of the premium list of our State Fair. A cordial invitation is extended to all to participate in the

#### Essays, and their Advantages.

EDWIN FRANCE.

1 find it difficult to get members of bee-keepers' societies to write essays for conventions. There is always some excuse—no time, not posted, no experience, some one else can do bet-

ter, etc.

Let me ask, are bee-keepers' associations profitable, or likely to be? I think we can all profit by them if we do our part. We get together to talk over matters belonging to the bee business, and, as our time together is short, it is important that we come is that it the point on everything and right to the point on everything, and we want to take up as many of the most important points as our time will admit. Now, I think it is important most important points as our time will admit. Now, I think it is important that every member have some point assigned to him, and let him post up and gather together all the evidence he can bearing on that point, and write it down to be read at the next meeting. Should it happen that be cannot come, he can send it to be read. There is no member that will be so much benetitted by it as the one that writes the essay, because, if I write on any subject I have to think and post myself on it, and call to mind many things that I would not otherwise have thought of; I shall examine the bee-papers and think over my past

the bee-papers and think over my past experience in that direction. In that experience in that direction. In that way Ishall, perhaps, find many things to remind me of something that I ought to do, that will be a benefit to me. If we ever make the business a success we must think—we must study all the wants and habits of the bee. There are many things to be thought of, and I know of no way that will induce us to think on any subject as much as to write on it, and one is

must work, think, talk and write. If muse work, think, talk and write. If there is anything we do not under-stand, that is the very point we should write upon, for, if we do ourselves justice, we will post up on that point. In fact, we want to post up on every point in the business.

Let no one try to excuse himself on Let no one try to excuse himself on the ground of inability. Some say: "I can't write anything; there are others that can do better, and if I do write, I am just as likely to say some-thing wrong as right." If that is the case, by all means say it; say it be-fore the meeting, for if you are wrong very likely some of the members can correct you and put, you on the right correct you, and put you on the right track. The sooner you are corrected,

track. The somer you are corrected, the better for you.

I want all to criticize me just as closely as they can. If I say something you do not understand, ask for an expension of the say planation, or, if you cannot agree with me, say so, and let us talk the matter over. Perhaps I am wrong; if so, I want to be corrected. We can learn a want to be corrected. We can learn a great deal from one another, in fact, we can learn a great deal from mis-takes made in bee-keeping, as well as any other matter. I think we should any other matter. I think we should establish a question box; that is, if anyone has questions to answer or be answered, let them write each question on a slip of paper and hand it to the Secretary to be read and answered by any member. If it will take too long to explain now, have it assigned to some one to answer at our next meeting.

As we can gain knowledge by observation, we should closely watch everything belonging to the bee business. If we lose a colony of bees try and find out why it was lost, make a record of it, and bring the report to the meeting and let us all know about it so ing and let us all know about it, so that we can be prepared to avoid a similar loss.

1 often find, while working with bees, that I get an idea clearly demonstrated, and if I do not note it down onstrated, and if I do not note it down it is soon forgotten and lost. Therefore, I think it would be a great help if everyone would write down and bring to the meeting such things as they may think of from time to time. Either in the way of questions or improvements, let no good idea be lost, for we need all the help we can get.

Platteville, Wis.

Bee-Keepers' Union.—The Eastern Bee-Keepers' Union.—The fastern
New York Bee-Keepers' Union Association, will hold their eighth semiannual Convention on Tuesday, Sept.
27, 1881, at 10 a. m., at Knowersville,
N. Y. All bee-keepers are invited to
attend. W. D. Wright, Pres.
N. D. West, Sec.

The Southern California Dis-The Southern California District Bee-Keepers' Association will hold its annual meeting in Los Angeles City, Sept. 8, 9, and 10, 1881. All persons interested in bees and honey are respectfully invited to attend.

J. E. Pleasants, Pres. Analicim, Cal.

The Northwestern Bee-Keepers' Association will meet in Chicago, on Association will meet in Cineago, on Tuesday and Wednesday, October 25 and 26. All bee-keepers are cordially invited to attend. It is desired to make this one of the most interesting conventions ever held in the United States. C. C. MILLER, M. D., Pres. States. C. C. MILLER,  $M_{\odot}$ . C. C. COFFINBERRY, Sec.

The Eastern Michigan bee-keepers'Association will hold its fall meeting in Detroit, Oct. 4, in the Y. M. C. A. hall, at 10 o'clock a. m.
A. B. Weed. Sec.

The Southwestern Wisconsin Bee-Keepers' Association will hold its next meeting in Platteville, Grant Co., Wis., Nov. 30, 1881.

N. E. FRANCE, Sec., Platteville, Wis.

The Fall Honey Yield.-Bees are doing well here now; they are working on buckwheat. I received a good crop of clover honey, and I think we will of buckwheat and other fall flowers. I attribute my success to the JOURNAL and Cook's "Manual of the Apiary." Success to each.

A. RIIINEHART. Corning, N. Y., Aug. 15, 1881.

My Season's Report.—In the spring of 1880 I had 24 colonies of bees—blacks and hybrids. I obtained 2,000 pounds of comb honey and 800 pounds of extracted, and increased to 45. In October they were packed in chaff on their summer stands. On March 1 all were alive except 2 that starved, and nearly all were apparently strong and in good condition. As they were and nearly all were apparently strong and in good condition. As they were nearly out of stores, I opened the hives frequently and gave them honey and sugar candy over the frames. This disturbance, combined with the long, cold spring, caused them to dwindle, and only 15 colonies survived; 11 colonies swarmed out, abandoning brood in all stages 2 leaving as late as the onies swarmed out, abandoning brood in all stages, 2 leaving as late as the middle of May, when they were apparently prosperous. The queens in these colonies were given to strong ones that were queenless. I lost 10 queens in 4 colonies; they would lay a few days and then disappear. Out of 50 colonies in box hives, unprotected, belonging to different families, there are 6 alive. Mr. Stanton, of Sheridan, had 56 colonies last fall; 20 were in the winter hive; of these only one died; 36 were in single-walled one died; 36 were in single-walled one died; 36 were in single-walled hives, with chaffin the caps; of these only 15 lived, and they were very weak. The bees in the winter hive did not dwindle. I had one chaff hive, but that one did not have a pint of bees. I like those hives; they have all the capacity for side-storing or extracting that can be desired, or the side spaces can be used for queen-repring, and can be used for queen-rearing, and storing given above, and they are the nearest approach to a non-swarming hive of anything I have seen. One man at Ionia, 14 miles from here, had 22 colonies, packed the same as in the winter hive, and he only lost 2, and they came through in good condition. I purchased 10 of these colonies, and have now 57. I have 2 natural swarms that have gathered 80 pounds each of comb honey; I have 600 pounds of comb honey (clover and basswood), and the same of extracted. The bees and the same of extracted. The bees are getting honey now from buck-wheat. A few weeks ago, as I was cutting out queen-cells, one hatched in my hand. I caged her and placed the cage in a nucleus; in 2 days I released her; she crawled onto a comband immediately attacked a worker. heased her; she crawled onto a comb and immediately attacked a worker bee and stung it to death; in a few days she was laying. What a diver-sity of opinion there is on the subject of bee-keeping. I wonder why it is that men who are equals in intelli-gence, ability, experience and success, should differ so much in regard to the In the face of all these conflicting theories the beginner has to use his own judgment, and bearn by experience.

MRS. A. M. SANDERS.

Sheridan, Mich., Aug. 12, 1880.

[Men differ on every conceivable subject—on science, politics and religion just as much as on theoretical bee-keeping—though they are "equals in intelligence, ability, experience and success. '-ED.]

Irresponsible Supply Dealers.—I am out \$10 for attempting to deal with irresponsible parties, besides the loss sustained by not having the section responsible parties, besides the loss sustained by not having the section boxes ordered early, until late in the season. I think that when dealers prove unreliable or dishonest they should be exposed, so that others need not suffer loss by dealing with them. Bees are doing finely here now on leaves.—Ed.]

white clover; it was getting dry, but we have had a fine shower which will give clover another start. Success to the Westly Pay Leynov. the Weekly Bee Journal. the Weekly BEE JOURNAL. It is supplying a need long felt by apiarists, and when changed to the new form for next year, it will be better than ever.

S. H. Mallory.

Decatur, Mich.

Milkweed.—I send a bee with what appears to me a fungus growth upon its neck and the lower part of its legs. I find the workers of their own hive dragging a number of them out. This dragging a number of them out. This is taking place among other bees besides my own. This is among the black bees exclusively. I have Palestine and Italian bees, but it does not occur among them. I have put them under a 1-5 power glass of my micrograms but current tall what is is scope, but cannot tell what it is.

1. R. GAST, M. D.

Mifflinburg, Pa., Aug. 10, 1881.

[The bee sent was weighted down with pollen masses of the milkweed (Asclepius).—A. J. Cook.]

Auts.—To drive ants from bee hives Ants.—10 urve take a handful of tansy leaves and rub and scatter them about the part the ants will leave. Try it. If you have none growing plant some near the bee yard, to have it handy.

J. M. VALENTINE.

Carlinville, Ill.

Dry Weather and no Honey.—Bees are not doing very well; the weather is dry and I have no surplus up to this I put on top story and sections with foundation starters about a month ago, but the bees do not seem to take to it. C. W. FISHER.
Lewis, Iowa, Aug. 9, 1881.

The Basswood Yield. - Basswood has come and gone; for 2 years before this the yield of honey from it has been hght, and this year was no ex-on to what is getting to be the eeption to what is getting to be the rule, in this section; but perhaps the fact that a steam mill within one mile of my place is sawing it into lumber, at the rate of 500,000 feet per year, has something to do with the yield of it. Bees are now doing the best I ever saw them, at this time of the year, from the second crop of white clover. They hardly pay any attention to buckwheat, although there is plenty near.

N. F. CASE. Glensdale, N. Y., Aug. 9, 1881.

The axe has more to do with it than many think. We must plant for honey or get none, after a short time.—Ep.]

Well Done.—My bees have done well this season. I commenced with 16 colonies in the spring and transferred 9 of them from the box hive into the Jones hive, and increased to 32. I bought 3 colonies, making 35 on hand now, and I have taken about 2,200 pounds of honey since the spring, mostly extracted. We had a good season for honey. W. G. RUSSELL. Millbrook, Ont., Aug. 15, 1881.

Honey-Dew .- I would like to ask through the BEE JOURNAL, where does honey-dew come from? My bees were quite busy this spring on an oak tree that stands close by my shop. Some say it comes from a little insect; others, that it is dow which falls on the tree, but this oak tree stands under a big sycamore tree, and not a particle of the dew was on the sycamore tree, while the oak swarmed with bees every day for weeks, and other trees close by had none of the dew on them. I think it is the overflow of sap from the tree. JOHN BOERSTLEE.

John Boei Gilead, Ill., Aug. 13, 1881.

[The origin of honey-dew is a question of doubt among scientists. Some hold that it is an excrement emitted by Aphides, a small species of insect; others claim that it is the exudation of sap through the surface pores of the

Large Bee Ilives.—I bought my first colony of bees in a hive 12x12 and 10 inches deep. Of course I made all of my hives of that size, until I became tired of it. I made different styles of hives and frames after that, and this spring I made out? I inches from hives and frames after that, and this spring I made one 18 inches from front to rear, 20 inches from side to side, 934 inches deep, and 2 stories high. In this hive I put a good colony that wintered on 3 Langstroth frames; the spaces between the combs were 34 inches, and they contained sealed honey from top to bottom. Those frames were not only covered with bees, but crowded, and were wintered in a cellar. I never thought tered in a cellar. I never thought that a good colony of bees could be put on 3 combs, but it can be done. Bees never rear brood when crowded Bees never rear brood when crowded like that; but by giving them the whole hive and combs, bringing the honey from the outside combs to the center, they will rear brood and get uneasy. I was induced to make this large hive by Mr. Langstroth's article in Gleanings, in which he said a hive 18 inches from front to rear, and 18 inches from side to side, gave the best results. My hive is 20 inches from side to side and takes 28 frames, 14 below to side and takes 28 frames, 14 below and 14 in the upper story. The queen in this hive had 10 combs well filled with brood all the time, until I took one of brood away and gave it to a nucleus; then she kept 9 full. I tried to make her lay in another frame, so as to have 10 again, but she would not do to have 10 again, but she would not do it. This colony did not swarm, and gave the best results I ever had. I shall make all my hives of that size for the coming year. I have a number of queens that will be 2 years of age next June; they have been good layers all summer, and I thought of getting young queens in their place—will they be as good next spring as they were this spring?

WM. FRITZE.

Doubth Minn. Aug. 14, 1881

Duluth, Minn., Aug. 14, 1881.

(As your queens will be but 2 years old next June, they should be good yet; good, robust queens are thought to be better the second season than the first.--ED.1

Suitable Size for Nuclei.—In reply to Samuel Coulthard I would say that I do not claim to be an extensive queenbreeder, although I have been rearing queens, more or less, for the past 12 years. I prefer making nuclei boxes to suit the frames of the hive I use. I would make them large enough to hold 2 or 3 frames; if the nuclei is to contain but one frame, the remaining space can be filled with 1 or 2 divisionboards, as the case may be, and then it is an easy matter to add a frame of unsealed brood, as such is sometimes necessary. A full-sized hive answers as well for nuclei, only they cost more. In making boxes for nuclei 1 allow 1.7-16 inches for each frame. I have taken the BEE JOURNAL for a number of years, and must say that I am well pleased with the change from Monthly to Weekly. I could not well do without it. JAMES P. STERRITT. Sheakleyville, Pa., Aug. 12, 1881.

All Dried Up. -- Bees did very well All Dried Up.—Bees did very wen here the first part of the season, until the present excessive drouth commenced. We still have no rain—pasture and all kinds of flowers are completely dried up. We can only get our bees through by heavily feeding.

J. B. R. Sherrick.

Mt. Zion, Ill., Aug. 17, 1881.

Melilot or Sweet Clover.—I bought some of this because you recommended it so highly as a honey producer. I sowed early in the spring, on a rich wheat field, as a test 1 before sowed a little with spider plant; that sowed with spider plant has grown from 2 to 6 feet high, and bloomed finely. On one stalk from one seed branching one stalk from one seed, branching out in every direction like a peach tree, I counted 31 biossoms, and this present great drouth does not affect it, while everything else is dead, and bees are starving. I wish I had put 2 acres of this in good rich soil, and to expeditious work.—E.D.]

The Northern Michigan Beester Your Association will hold its fourth Annual Convention at Maple Rapids, Clinton Co., Mich., Oct. II and 12, 1881. O. R. GOODNO, Sec.

tilled it well. I think it would have tilled it well. I think it would have been \$200 to me this summer. The question is, what is Bokhara clover? is it an annual? if so, I have lost all my seed and labor sowing with wheat. My wheat was planted on very dry land. Spider plant done moderately well. The drouth has killed a part of the alsike clover; I had one acre, sowed last year; in the early summer it was literally covered with bees all day. Success to the Bee Journal.

Asbury McKnight.

ASBURY McKnight. Bible Grove, Ill., Aug. 13, 1881.

[Bokhara, melilot and sweet clover are virtually one and the same; at least we can see no difference. It is a biennal, and that planted with the wheat is not lost.—ED.1

Large Crop of Honey in New York.

—The yield of honey in this section is very good. The largest yield of extracted honey for a single colony I have known here has been 306 pounds. My largest (the largest I have weighed but I this transport of the second of the largest I have been also be a second of the second of the largest I have been also be a second of the largest I have been also be a second of the largest I have been also be a second of the largest I have been also be a second of the largest I have been also be a second of the largest I have been also be a second of the largest I have been also be a second of the largest I have been also be a second of the largest I have been also be a second of the largest I have been also be a second of the largest I have been also be a second of the largest I have been also be a second of the largest I have been also be a second of the largest I have been also be a second of the largest I have been also be a second of the largest I have been also be a second of the largest I have been also be a second of the largest I have been also been by largest the largest have weighed by 1 or 2 others) has been 218 pounds, with about 30 pounds of buckwheat still to extract.

C. M. Bean.

McGrawville, N. Y., Aug. 16, 1881.

Rearing Pure Queens.—Please give, through the Bee Journal, the best way to rear pure Italian queens, from a pure queen, among a hundred colonies of black bees? I have a very fine queen I received, a year ago, of A. H. Newman; she is the finest I ever saw. Her progeny is perfect. I have some red clover queens, from a queen purchased of A. I. Root, but they breed all colors from a light colored Italian to a black; they work on red clover in to a black; they work on red clover in preference to white clover or anything else, except basswood (which amounts to nothing here this season) and goldenrod. My bees done splendidly early in the season, but since July 1 all they have done is breeding, which has been immense. It is favorable for has been immense. It is favorable for a good crop from this on. I shall endeavor to rear pure queens next season, and want the best way, under the circumstances. The JOURNAL the circumstances. The 300AAAA would be welcome daily, or as it is.

A. J. Norris.

Cedar Falls, Iowa, Aug. 18, 1881.

[It is of no use to try to rear pure Italian queens among 100 colonies of native bees. By removing the colony of pure bees to some remote part of the farm you may accomplish it.-ED.]

Foul Brood Again. - There is no doubt that boiling hives, frames, etc., is a sure cure for foul brood, for I have the authority of Mr. J. S. Harbison, who, when at Sacramento, was trouwho, when at Sacramento, was trou-bled so much that he made a tank to boil his hives in. If we could heat the wax to the same point there would be none of the foul brood germs left in it, but it is almost impossible to do it. I render all of mine under glass in my honey tank, at about 150° or 160°, and could melt my wax and make foundation in the summer time, never using fire heat, if I wanted to; so, for one, I do not want any foundation made from foul brood wax.

S. S. BUTLER, M. D. Los Gatos, Cal., Aug. 10, 1881.

IWe doubt whether any insect life could withstand, for any considerable time, the amount of heat necessary to transform comb into foundation; nor would contagious influences. What Dr. Butler might do without fire heat, is not the method pursued by foundation manufacturers: they find a much greater amount of heat necessary to do expeditious work.—Ed.]

#### SPECIAL NOTICES.

Single copies of the JOURNAL sent postage paid for 5 cents each.

Those who may wish to change from other editions to the Weekly, can do so by paying the difference.

Advertisements intended for the BEE JOURNAL must reach this office by Saturday of the previous week.

Ribbon Badges, for bee-keepers, on which are printed a large bee in gold, we send for 10 cts. each, or \$8 per 100.

Articles for publication must be written on a separate piece of paper from items of business.

Photographs of prominent Apiarists—Langstroth, Dzierzon, and the Baron of Berlepsch.—Price 25 cents each. ....

When changing a postoffice address, mention the old as well as the new address.

Constitutions and By-Laws for local Associations \$2.00 per 100. The name of the Association printed in the blanks for 50 cents extra.

The Beauty and Color of the hair may be safely regained by using Par-ker's Hair Balsam, which is much ad-mired for its perfume, cleanliness, and dandruff eradicating properties. 31w4

Nearly all the ills that Afflict Man kind can be prevented and cured by keeping the stomach, liver and kid-neys in perfect working order. There is no medicine known that will do this as quickly and surely, without inter-fering with your duties, as Parker's Ginger Tonic. See advertisement.

A Sample Copy of the Weekly BEE JOURNAL will be sent free to any per-son. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office.

Examine the Date following your ame on the wrapper label of this name on the wrapper label of this paper; it indicates the time to which paper; it indicates the time to which you have paid. Always send money by postal order, registered letter, or by draft on Chicago or New York. Drafts on other cities, or local checks, are not taken by the banks in this city except at a discount of 25 cents, to pay expense of collecting them.

Preminms.—For a club of 2, weekly we give a copy of "Bees and Honey;" for a club of 5, weekly, we will give a Cook's Manual, a Bee-Keeper's Guide, bound in cloth; for a club of 6, we give a copy of the Journal for a year free. It will pay to devote a few hours to the Bee Journal.

It would save us much trouble if all would be particular to give their post office address and name, when writing to this office. We have letters (some inclosing money) that have no name, post-office, County or State.—Also, if you live near one postoffice and get your mair at another, be sure to give the address we have on our list.

Premiums. - Those who get up clubs for the Weekly BEE JOURNAL for 1882, will be entitled to the following premiums:

For a Club of 2, -a copy of "Bees and Honey."

3, -an Emerson Binder for 1882.

4, -Cook's (Bee) Manual, paper.

5, - " "loth.

6, -Weekly Bee Journal for 1 year.

We bave a SPECIAL EDITION of the Weekly BEE JOURNAL, just as it will be published in 1882 (16 pages), for distribution at Fairs, Conventions. etc. Any one who may desire to distribute them to bee-keepers will be snpplied free, in any quantity they may be able to judiciously use.

#### Honey and Beeswax Market.

BUYERS' QUOTATIONS.

#### CHICAGO.

HIOMEY - New honey is coming in freely and the demand is good. We quote light comb honey, in single comb boxes, 18@20c; in larger boxes 2c, less. Extracted forth.

(699); BEESWAX - Prime quality, 186/200; AL, 11, NEWMAN, 972 W. Madison St. Chicago, Aug. 20, 1881.

#### NEW YORK.

HONEY-There is no settled market price yet for honey, as there is none selling.
We quote as follows: White comb, in small boxes, 156618c; dark, in small boxes, 126415c. Extracted, white, 166912c; dark, rashe.
BEESWAX.-Prime quality, 226624c.
THORE & CO, 11 and 13 Devoc avenue.
New York, Aug. 18, 1881.

#### CINCINNATI.

CINCINNATI.

HONEY.—Last week I paid King Cramer 17c, per 1b, for a lot of about 2(\*\*) lbs. It was in the Muth sections, 54x6, without separators. Every comb is perfect, which speaks well for the producer. If Mr. Cramer did not succeed, this season, in extablishing rules for queen fertilization, he succeeded admirably in getting one of the finest lots of comb honey in the country. Extracted boney is just commencing to be in good demand.

I quote: Good comb honey, in sections, is worth 14colife., on arrival. Extracted, 7c 9c, on arrival. BEESWAX.—186 22c., on arrival. I have paid 25c, per lb. for choice lots. C. F. MUTH.

Cincinnati, Aug. 13, 1881.

#### ST. LOUIS.

ST. LOUIS.

HONEY—At present the market is prostrated; there is no activity whatever. Aside from a sale on Monday of 13 bbls. old Louislana at 5½c., nothing reported. We quote: New, strained, 7c.sc.; extracted, in cans, 9@10c.; comb, 12@13c.; old is nominal.

Ominal.
BEBSWAX—Prime yellow sells at 21c.
R. C. GREER & Co., 117 N. Main Street.
St. Louis, Mo., Aug. 18, 1881.

#### BOSTON.

HONEY-The prices of honey are not regularly uoted in our papers here. We quote: Honey in pound sections retails at 25c.; in 2 pound sec-

ions, 20c. BEESWAX—Prime quality, 25c. CROCKER & BLAKE, 57 Chatham Street, Boston, Mass., Aug. 17, 1881.

#### CLEVELAND.

HONEY-Comb boney, in unglassed sections, is in extraordinary demand at 196/20c, for 1 lb, white and 186/19c, for 2 lb, sections. Extracted honey is not so lively, but salable at 196/12/gc, per lb, in 30 to 50 lb, cans.

BEESWAX-196/25c.
A. C. KENDEL, 115 Ontario Street. Cleveland, O., Aug. 18, 1881.

#### SAN FRANCISCO.

SAN FRANCISCO.

HONEY—An invoice of 267 cases and 7 bbls, was forwarded this week to Liverpool, shipped by a packing firm. The market is quiet, but holders are not disposed to shade rates.

We quote white comb, 14-616c.; dark to go d,1166
13c. Extracted, choice to extra white, 196,1649c.; dark and candied, 76-8c. BEESWAX—236-25c.

STEARNS & SMITH, 23 Front Street.
San Francisco, Cal., Aug. 13, 1881.

Price 25 cents.—Sent on receipt of price, by Address.

THOMAS G. NEWMAN,

## TIN PAILS FOR HONEY. The Bee-Keeper's Guide;

### MANUAL OF THE APIARY, By A. J. COOK,

Of Lansing, Professor of Entomology in the

State Agricultural College of Michigan.

320 Pages; 133 fine Illustrations.

This is a new edition of Prof. Cook's Manual of the Apiary, enlarged and elegantly Illustrated.
The first edition of 3,000 copies was exhausted in about 18 months—a sale unprecedented in the annals of bee-culture. This new work has been produced with great care, patient study and persistent research. It comprises a full delineation of the anatomy and physiology of the honey bee, illustrated with many costly wood engravings—the products of the Honey Bee; the races of bees; full descriptions of honey-producing plants, trees, shrabs, etc., splendidly illustrated—and last, though not least, detailed instructions for the various manipulations necessary in the apiary.

This work is a masterly production, and one that no bec-keeper, however limited his means, can afford to do without. It is fully "up with the times" on every conceivable subject that can interest the apiarist. It is not only instructive, but intensely interesting and thoroughly practical.

Read the following opinions of the Book;

All agree that it is the work of a master and of real value.—L'Apiculture, Parls. I think Cook's Manual is the best of our Ameri-can works.—LEWIS T. COLBY.

can works.—LEWIS T. COLBY.

It appears to have ent the ground from under future book-makers.—British Bee Journal.

Prof. Cook's valuable Manual has been my constant guide in my operations and successful management of the aplary.—J. P. WEST.

agement of the aparty.—J. F. W.Est.

I have derived more practical knowledge from Prof. Cook's New Manual of the Apiary than from any other book.—E. H. WYNKOOP.

any other book—E. H. WYNKOOP.

This book is just what everyone interested in bees ought to have, and which, no one who obtains it, will ever regret hiving purchased.—Mich. Far. Is a masterly production, and one that no beekeeper, however limited his means, can afford to do without.—Nebruska Farmer.

To all who wish to engage in bee-culture, a manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Herald, Monticello, Ill.

With Cook's Manual, an more than played. It

manual is a necessity. Prof. Cook's Manual is an exhaustive work.—Herald, Montieello, III.

With Cook's Manual I am more than pleused. It is fully up with the times in every partieniar. The richest reward awaits its author.—A. E. WENZEL.

My success has been so great as to almost aston-bit upself, and much of it is due to the cleur, disinterested information contained in Cook's Manual.—WM. YAN ANTWERP, M. D.

It is the latest book on the bee, and treats of both the bee and hives, with their implements. It is of value to all bee-raisers.—Ky. Luce Stock Record.
